The Year at Home and Abroad

National Affairs

For a large majority of the American people the prosperity that attracted the attention of the world in 1902 was prolonged throughout the past year. Abundant crops, a full Treasury at Washington, a currency standard no longer menaced, a great volume of foreign trade, and unprecedented activity in domestic manufactures and transportation were the chief supports and proofs of this prosperity. In the closing months of the year, however, the effect of a long and continuous decline of share values in the Exchange markets began to be felt in some important industries and by capitalists of the middle class in many parts of the country. This decline and the unwise action of labor unions (notably in the building trades) have caused a reduction of output and wages in the iron industry, together with retrenchment elsewhere.—In the field of politics there has been no event that marks a revolutionary change in the situation. Mr. Roosevelt is the candidate of a vast majority of Republicans for the Presidency. Owing to his action concerning the Anthacite Coal strike and the combination of railroads in the Northwest, he is not acceptable to certain powerful capitalists. It is asserted, apparently on good authority, that he recently declined an offer of their support, conditioned upon pledges which he was asked to give. Senator Hanna has repeatedly said that he is not a candidate, but he will retire from the National Committee. A contest between Governor Odell and Senator Platt for power in New York causes some anxiety in Republican councils. On the other side, the definite and apparently final refusal of Mr. Cleveland to be a candidate for the nomination has given much prominence to Alton B. Parker, Chief Judge of the New York Court of Appeals, altho he has made no effort for his own political preferment. His most formidable competitor is Senator Gorman. Throughout the year Mr. Bryan has publicly attacked and denounced nearly all of the Democrats who have been mentioned in connection with the office.—The political event of the first half of the year was Mr. Roosevelt's long tour, in the course of which he passed through 22 States and 2 Territories, made 265 speeches, attended innumerable receptions and laid no end of corner-stones. No more enthusiastic reception had ever been given to a President. Congress had very recently enacted the new laws concerning Trusts. These laws, which he had suggested, were among the subjects of his addresses. He spoke forcibly of the Monroe Doctrine; defended the protective policy, saying that Trusts could not be reached and restrained by tariff revision; defended the army against the criticism of certain Anti-Imperialists; gave sound advice to employers and employees, commending the award of the Coal Strike Commission, announced a few weeks earlier; deprecated class enmity, and discussed many other topics. On the Pacific Coast, which he was visiting for the first time, he predicted the domination of the Pacific Ocean by the United States, and argued for the construction of a strong navy. In the seclusion of Yellowstone Park he rested for two weeks, studying the ways of wild animals, in company with John Burroughs. At the dedication of the St. Louis Exposition buildings the orations were delivered by President Roosevelt

and Ex-President Cleveland. After 66 days of strenuous traveling and speaking, the President returned to Washington in good spirits and excellent health. —In the course of this tour the question arose whether the approaching Republican convention in Ohio should call for the nomination of Mr. Roosevelt in 1904. Mr. Hanna thought it should not, but the President (then in Walla Walla) telegraphed to him that he desired this recommendation. The Senator yielded, and the indorsement was placed in the platform.—In November the State elections showed that the Republican party's strength had not been diminished. The overwhelming defeat of Tom L. Johnson (candidate for Governor) in Ohio was regarded as unfavorable to Mr. Bryan and his supporters in the Democratic party. It was also distinctly a triumph for Senator Hanna, who was at once urged by his friends, but in vain, to become a candidate for the Presidential nomination.—In Rhode Island Governor Garvin, a Democrat, widely known because of his public denunciation of bribery at the polls in that State, was reelected, as were also the labor union Mayors of San Francisco, Bridgeport and Ansonia. The Socialist vote in Massachusetts was reduced by one-quarter, and the Socialist party lost two of its three members of the Legislature. Great interest in the New York municipal election was expressed throughout the country. There was much surprise when it was known that the Reform party and its Mayor, Mr. Low, had been defeated by Tammany, whose successful candidate, Congressman George B. McClellan, took the office at the beginning of the new year.—Owing to changes which took place in the early part of 1903 the Senate is now composed of 57 Republicans and 33 Democrats. Among the new Senators is Reed Smoot, an Apostle of the Mormon Church, and an attempt to unseat him is soon to be made. The old controversy over Mr. Addicks having been renewed in Delaware, he withdrew temporarily, and the two factions of the party reached an agreement, electing his political manager, Mr. Allee, for the long term, and Dr. Ball, an opponent of Addicks, for the short one. Mr. Gorman entered the Senate again and was promptly made chairman of the Democratic caucus.—At the beginning of the year it was arranged by treaty with Great Britain that the controversy with Canada over the Alaskan boundary should be referred to an evenly divided Commission of six persons. The members for the United States were Secretary Root, Senator Lodge and Ex-Senator Turner. On the other side were two representatives of Canada and Lord Alverstone, the Chief Justice of England. The Commission sat in London, where, by the vote of Lord Alverstone, in October, a decision was made that virtually sustained all the claims of the United States, altho an unimportant concession was made with respect to the Portland Channel. The two Canadian Commmissioners refused to sign the report, and the decision caused much dissatisfaction in Canada, where it is now proposed that the mother country shall be asked to grant to the Dominion larger powers of self-government and the right to deal with such questions by means of its own agents.

Legislation—Postal Service Frauds

Three bills relating to Trusts were passed in February —one to expedite trials and decisions, one providing for publicity with respect to corporations by means of reports to the Bureau of Corporations, and the Elkins bill against railroad freight rebates. The more severe bill suggested by Mr. Knox and passed by the House was laid aside in the Senate. Other important legislation included the General Staff and Militia bills, mainly the fruit of Secretary Root's labors, and an appropriation for five battle ships. Owing to the coal strike, the duties on coal were removed for one year. At a special session of the Senate, in March, the Canal treaty with Colombia, and the treaty of reciprocity with Cuba, were ratified; but the passage of a bill by both Houses was required to make the latter effective. Therefore the new Congress was assembled in extra session on November 9th. The required bill was promptly passed in the House, but not until December 16th did it become a law by the action of the Senate and the signature

of the President. Mr. Cannon, of Illinois, was elected Speaker of the House. —Frauds and maladministration in the postal service were subjects of investigation throughout the year, the chief results being the removal of thirteen bureau officers, the resignation of four, and forty-seven indictments involving thirty-one persons. Among the indicted were James N. Tyner, Assistant Attorney-General for the Department, ex-Congressman Driggs and State Senator Green, of New York. As a rule, the frauds were committed by corrupt agreements relating to the purchase of supplies. Machen, Beavers and other prominent bureau officers appear to have demanded tribute from all contractors. The law office, it is charged, was corruptly in league with fraudulent concerns that desired to use the mails. Charles J. Bonaparte and Holmes Conrad were employed to conduct the prosecutions. The investigation, which was made by Fourth Assistant Bristow, was suggested in part by the charges of Seymour S. Tulloch, but these related chiefly to maladministration under First Assistant Perry S. Heath, who retired some time ago. They were also to the discredit of Postmaster-General Smith, and they have been confirmed by the Civil Service Commission and by Messrs. Bonaparte and Conrad. If Mr. Heath violated the law, he is protected by the statute of limitations. Thus far, having the friendly support of Senator Hanna, he has persisted in retaining the office of Secretary of the Republican National Committee, altho Mr. Roosevelt would be glad to have him resign.—Extensive frauds in the public land service, and irregularities in the disposition of Indian lands under the Dawes Commission, were also uncovered. Several officers of the public land service were indicted, and with them John A. Benson, a millionaire land speculator.

Panama and the Canal

In the record of the year for America there has been no event more important than the secession of Panama. Our canal treaty with Colombia was ratified at Washington in March; at Bogota, in August, it was rejected or disapproved by unanimous vote, to the great disappointment of the Isthmus State. Official papers warrant the conclusion that Colombia sought to defer action for a year in order that she might by forfeiture reclaim the Canal Company's franchise, take its property and then demand for herself the $40,000,000 which the company was to receive from our Government. Among those who publicly warned President Marroquin in July that failure to ratify the treaty would be followed by the secession and independence of Panama under our protection was M. Bunau-Varilla, now the Panama Minister at Washington. The independence of the Isthmus was dclared on November 3d, the railway terminal at Colon was protected by our marines; 450 Colombian soldiers were induced to sail for home; several of our war ships were ordered to the Isthmian ports, with instructions to prevent invasion, under the treaty of 1846. M. Bunau-Varilla was appointed Minister on the 7th, and on the 13th we formally recognized the new republic. Recognition has since been given by all the great Powers of Europe and by several countries of South America, where Colombia finds no sympathy. A new Canal treaty was at once negotiated with M. Bunau-Varilla, and it was ratified in Panama on December 2d. It will be ratified at Washington, but only after a long debate, owing to the hostile attitude of Mr. Hoar and some of the Democratic Senators, who assert that our Government's course has been dishonorable or unlawful. The current history of the affair has been published in our recent issues. Our Government's policy was explained and defended in the President's annual message. Colombia, apparently awaiting the result of the hopeless mission of General Reyes (now in Washington), has not yet sought to invade the Isthmus, which is guarded by our marines and ships. In the new treaty the United States promises to maintain the independence of the republic.

The Islands

The new Pacific cable was opened for use from San Francisco to the Hawaiian Islands on January 1st, and to Manila on the evening of July 4th, when the President sent a message of congratulation to Governor

Taft and received an answer in 29 minutes.—In the Philippines the most important events of the year are of a recent date—the purchase of the friars' lands, in December, for $7,239,784, and the brief war in Jolo, a few weeks earlier. Ladrones were very active in Luzon during the first half of the year, and there were many engagements between them and the constabulary. The islands were suffering from currency fluctuations and the ravages of cholera, rinderpest and locusts. Therefore Congress appropriated $3,000,000 for their relief. By a law passed at the beginning of March the gold standard was established. Before the end of September the ladrones had been subdued. In April Captain Pershing set out to reduce the hostile Moros around Lake Lanao, in Mindanao, and hundreds of them were killed in their forts on the shore of the lake before the rulers of these people decided to submit. General Leonard Wood, who had been made Governor of the Moro Province, found it necessary, in November, to attack the Moros on the island of Jolo, where they had besieged the small American garrison, having been offended by a new law against slave hunting and by the burial of pigs with the dead bodies of fanatics who had murdered American soldiers. The war was a short one; nearly 400 Moros were killed, and the survivors either surrendered or fled to the swamps. As the Sultan was implicated, our treaty with the Moros may now be abrogated.—The Rev. J. J. Harty, of St. Louis, has been made Archbishop of Manila, and three new Catholic Bishops have been appointed from the States. The new Chief Justice, John T. McDonough, is also a Catholic. He was Secretary of State in New York when Mr. Roosevelt was Governor.—The Commission's project for an opium monopoly, to be given to the highest bidder, under certain restrictions, has been laid aside, owing to opposition in the States. —At the beginning of the year Governor Taft declined an appointment to the United States Supreme Court, believing that he ought to remain at Manila. This was also the belief of the Filipinos. In December, however, he gave up his office and left the islands, to become Secretary of War, owing to the approaching retirement of Secretary Root.—Porto Rico still suffers from the loss of its old markets for coffee. During the year order has easily been preserved by the native constabulary. In August there were parades of workingmen in San Juan, under black flags and with the American flag draped in mourning. Many arrests were made. A conflict between the local authorities and Attorney-General Knox concerning army and navy officers indicted for smuggling goods from St. Thomas has caused some dissatisfaction. Indictments were repeatedly found, but instructions from Washington required them to be dismissed. Among those who were thus accused were the commander of the naval station and the Collector of the port of San Juan, Alonzo Cruzen, who recently resigned. Capitalists from Philadelphia have undertaken to construct an electric railroad across the island, from San Juan to Ponce.—The record of the year in Cuba has been uneventful. A loan of $35,000,000 for the payment of soldiers' claims has been authorized, but not yet negotiated. The army list of 53,000 names calls for about $45,000,000. After long delay the treaty of reciprocity with the States went into effect on December 27th. Our Government has acquired a site for a naval station at Guantanamo Bay, where, in a tract of 30 square miles offering great advantages a naval base of much importance will be established. There will be another station at Bahia Honda.

Other Events

The great and menacing controversy at the anthracite coal mines was settled for three years in March by the decision of the Commission, granting a wage increase of 10 per cent. (going back to November), with provision for further increase depending upon the price of coal, and for a permanent Board of Conciliation. Discrimination against non-union men was forbidden. In New York the building industry was paralyzed by another great controversy. For months 125,000 workmen were idle; work upon $90,000,000 worth of buildings was suspended, and $35,000,000 in wages was lost. All this was due chiefly to the influence of dishonest walking delegates, three of whom

were convicted and sent to prison for extortion. Other prominent events in the labor record were the bitterly contested railway strikes in Waterbury, Bridgeport and Richmond; the strikes at the mines in Colorado, where all the State's militia were in the field for weeks; the signal defeat of the Socialists in the Federation convention, and the reinstatement of Miller in the Government bindery by the President after expulsion from his union had caused his dismissal.—In February the decision against the Beef Trust was announced; in April was made known the important decision against the Northern Securities railway merger.—Heavy rains, following a series of tornadoes, at the end of May caused destructive floods at Topeka, Kansas City and St. Louis, where 150 lives were lost and 45,000 persons were for a time homeless. At the same time the dry forests in the East were burning, and on June 4th the streets of New York were full of smoke. In June sudden floods from the hills killed 200 persons at Heppner, Ore., and 80 near Spartanburg, S. C. —Vermont and New Hampshire, after a century of prohibition, turned to license and local option.—The worst of the year's railway collisions took place near Westfield, N. J. (23 lives lost), in Arizona (35 lives) and near Connellsville, Pa., on December 23d, where 68 passengers perished. But these calamities were far surpassed by the appalling fire in the Iroquois Theater, at Chicago, on the afternoon of December 30th, where, at a holiday matinee, 587 persons, many of them children, were killed in a few minutes.

Latin America

Aside from the Panama situation and the revolutions in Santo Domingo and Honduras, in which no special principles were involved, the trouble between the Allied Powers and Venezuela, which has resulted in a trial at The Hague Court, is the one important thing affecting the interests of Latin America. Indeed, the taking to The Hague Court of a case in which practically all the nations of the world are interested was perhaps the most important thing that has happened this year in international affairs. Altho Venezuela was blockaded by Italy, England and Germany over a year ago, still the principal negotiations which brought the case to The Hague took place in Washington last January and February between Mr. Bowen, in behalf of Venezuela, and the representatives of the Allies, altho the Allies tried in every way to take the case over Mr. Bowen's head and to avoid going to The Hague Court. It is generally conceded that Minister Bowen planned his case with such foresight that he won a diplomatic triumph for Venezuela and obtained for her much more than could have been expected. The Allies only went to The Hague with much reluctance, where the case was argued as to whether they should obtain preferential treatment in the payment of their claims over the Peace Powers who had not tried to obtain their money at the cannon's mouth. The trial is now ended, but the court is not expected to render its decision until February. No matter how the case is decided, the court has now been recognized by all the nations of the world, and its permanent establishment seems now to be a matter of no question.

Mr. Chamberlain

In England Mr. Chamberlain is playing a star part in the drama of politics, and events can be most easily considered in connection with his dominant personality, which exerts a powerful influence over all persons, friendly or inimical, with whom he comes in contact. It might be supposed that he, more than any other man, would be a *persona non grata* as an envoy to South Africa, for on him rested, justly or unjustly, a large part of the blame for the war, which was so disastrous to the Boers and which inflicted almost equal injury, tho not so fatal, upon the English people. Yet there seems to be no question but that his visit to South Africa, where he met the most irreconcilable of Boer leaders in open debate, did much to heal the wounds of war, and to inspire all factions with a greater sense of their community of interests. Returning home, as he says, tho in other words than these, with his thoughts fixed on the affairs of the empire, he was pained to find that the people of the island were still discussing the same parochial problems as

when he left. Among these petty issues, which he dismissed so easily from his mind, were the scandalous disclosures of mismanagement and inefficiency in the conduct of the late war as proved by the report of the investigating commission, and the new Education act, which, as it increased the influence of the established church in the management of schools supported by public money, had produced on the part of the Nonconformists what was practically a revolt against the Government, tho carried on by the weapons of "passive resistance." Still, he did succeed in throwing into the background these not unimportant issues by boldly proposing the practical abandonment of the policy of free trade under which Great Britain had prospered and progressed for fifty years, and which had become an unquestionable dogma in the popular mind. He would have duties put upon certain articles with the double object of using these as weapons to force down the tariff walls of other nations, and by means of preferential duties draw the colonies closer in trade relations to the mother country. In his leaving the Cabinet and entering upon a campaign in an unpopular cause, he resembles Gladstone in his sudden espousal of the cause of Ireland's crusade for "home rule." As in 1886 party lines between Liberal and Conservative disappeared, and voters became "Gladstone" or "Anti-Gladstone," by which readjustment Mr. Chamberlain became allied with the Conservatives, so now in doubtful precincts candidates are supported because of their position in regard to the proposed fiscal policy without regard to their party affiliations. This new issue is raised just as the former one disappears, for the Irish question, altho not settled, for the Nationalists have not renounced their aspirations for Home Rule, has ceased to be a burning one, since the economic factor has been removed from it by the appropriation by the Government of some $100,000,000 to make up the difference between what the landlords were willing to sell for and the tenants were to pay for their land. Unlike Gladstone, Mr. Chamberlain's party did not go out of power with him, for Mr. Balfour, by some adroit management which has drawn down on him severe criticism, only partially assumed responsibility for Mr. Chamberlain's ideas, and so, if he can avoid for a few months any difficult questions, will hold the reins of power until "the campaign of education" is further advanced.

Socialists in Power

The theory, often heard, that the sobering effect of responsbility is sufficient to convert into practical and constructive statesmen those who, before they came into power, aroused popular distrust on account of the impractibility of their schemes and the violence of their language is to a great extent confirmed by present conditions in Europe. In Germany the Social Democratic party, as it steadily increases in numbers, is becoming less completely centered in the future and takes a more active part in present-day politics, altho not relinquishing its ideals of an order of society very different from the present *régime*. The Social Democrats cast 2,900,000 votes in the last election—nearly double the number of the next strongest party, and while in the Reichstag they maintain an almost purely critical standpoint, they are able to exert a strong influence on the Government against militarism, high tariff and the foreign policy. In France the Socialists, as they have come into power, have become opportunists, and such men as M. Jaures, vice-president of the Chamber of Deputies, and M. Combes, premier, are able to hold in check the violence of the irreconcilable of their party, while they hold a large and very heterogeneous majority steadily to their anti-clerical and anti-military policy. The law for the expulsion of unauthorized religious associations, whether engaged in the education of the young or in the manufacture of Chartreuse liqueur, has been carried out with much severity, and now a new act has been introduced which will result in the complete secularization of all the schools on the ground that the Government has not only the right to regulate instruction but also to forbid the teaching of doctrines inimical to republican principles. From an American standpoint these measures seem an altogether unwarrantable inter-

ference with the liberty of instruction, but it is probable that they are merely steps toward the abrogation of the "Concordat," by which Napoleon bound Church and State together. The appeal of the twice condemned and pardoned Dreyfus for a revision of his case has been granted, and the new evidence in the form of the forgery of documents on which the courts-martial rendered their decision is expected to result in his clearance and reinstatement in the army. —In Italy the reforms in the judiciary and economy in government have led to a greater degree of prosperity than was believed possible a few years ago, and acute distress, except in the extreme south, is alleviated. The administration, now in the hands of the Socialists and Liberals, proposes to cut down the interest on the public debt and nationalize the railroads.

The Suppression of Small Peoples

Just as in the industrial world there are two opposing forces at work, one tending toward the development of minor, local and household industries, and the other toward their consolidation in the factory and the trust, so in the realm of politics, the movements for intensification of the patriotism and race pride of small peoples come in conflict with the tendency toward imperialism or by whatever name may be called the formation of a unit nation out of heterogeneous groups. For many years the centrifugal impulse has been strongest all over the world, arousing national aspirations on the part of minor races and the revival and cultivation of almost forgotten dialects, such as the Provençal in France and Gaelic in Ireland, but during the past year the contrary force has prevailed, and the small peoples have suffered.—In Russia the suppression of the Finns, Poles, Armenians and Jews has been carried on with great severity. Without regard to his pledge as Grand Duke of Finland to maintain the ancient liberties and constitutional rights of the country, the Czar has practically converted it into a Russian province, ruled by a Russian Governor, to whom has been given almost despotic power of removal from office and exile of any who oppose him. The country has lost many of its foremost statesmen, authors, educators and clergymen, and its young men are seeking refuge in other lands rather than submit to service under Russian officers in Asiatic wars. The funds of the Armenian Church have been confiscated by the Government and the people kept in subjection by the exercise of martial law. The Jews have been restricted and harried in many parts of the Empire, and at Kishineff in Bessarabia an awful massacre took place without interference on the part of the authorities, and the special judicial commission appointed to try the rioters inflicted only slight penalties on a few of them, and has made no reparation for the immense destruction of property. The Zionist movement, for the establishment of an independent Jewish nation in Palestine, has been put under the ban of the Russian Government. The committees representing the provincial assemblies, who, on the invitation of Minister Witte, petitioned for a greater degree of local self-government, were met with refusal and punishment by Plehve, whose restrictionary and military policy seems now to have replaced the plans for peace and internal development carried on by Witte. The money accumulated by the latter through nationalized industries is apparently to be spent in war, and his Siberian railroad used to transport troops instead of colonists. M. Plehve, in his effort to suppress the nationalistic spirit in Poland, went so far as to insist that Polish Catholics should be allowed to worship and preach only in the Russian language. That portion of the dismembered kingdom which is under Prussian control fares little better, for great efforts have been made to root out the Polish language as a medium of secular and religious instruction. The Hungarians, while successful in promoting their own national interests, have been relentless in suppressing those of the Slavs of Croatia, who resent the dominance of the Magyars as the Magyars do that of the Germans.—The rising in Macedonia resulted in nothing save the devastation of the country, the massacre of its inhabitants and the destruction of towns, bridges and railroads by the equal barbarity of the revolutionists and Turkish soldiery.

The Religious World

In the religious world we notice the steady progress of missions in non-Christian lands. The decennial census in India reports that while Hinduism shows a relative decrease, and Mohammedanism a very small increase, the increase in the ratio of native Christians, and especially of Protestants, has been very large. In China the mission work interrupted by the Boxer troubles has been restored on a larger scale and with increased success.—The coming together of denominations is a marked feature the world over. In this country the Congregationalists, the United Brethren and the Methodist Protestants have arranged a plan of union, and other unions have been hopefully inaugurated. In Australia, Methodists, Congregationalists and Presbyterians have such a union well under way, thus breaking across what has seemed a closed wall of polity. Wherever unions have been made, as in Japan, Canada and England, there is no complaint of the result.—The death of Pope Leo XIII and the succession of Pius X has been one of the most important events in the ecclesiastical history of the year. There has been a universal expression of esteem for the late Pontiff, and an expression of hopeful respect for his successor. It is too early to judge what his policy will be, but it is expected that there will be a gradual relaxing of the bitterness which has existed between the Papal power and the Italian monarchy. But perhaps more important is the anticipated effect on the relations between the Vatican and the French Government. Leo had a very patient affection for France, and urged his spiritual subjects to make terms with the Republic. This they were slow to do, and the result is seen in the legislation which is shutting up the schools maintained by the orders and the expulsion of many of them from the country. The French Republic regards the Church as its greatest enemy at home and its greatest friend in the colonial world. Pius X has as yet shown no relaxation of the rule forbidding good Catholics to take part in Italian politics, and in France he has as yet given no indication of his policy.—Theological conflict has been especially active in Germany, originating in the two lectures by Professor Delitzsch on "Babel and Bible," given before the Emperor. It was especially offensive to many readers that he claimed that the Mosaic institutions and religious ideas had their origin in Babylonia rather than in revelations, and a multitude of pamphlets, ignorant and learned, followed, as well as a further defense of his views by Professor Delitzsch; but the discussion has not raised much of a disturbance in other countries. For England and America of really more interest has been the completion of Professor Cheyne's "Encyclopædia Biblica," which practically rejects all supernaturalism in the New Testament, as well as the Old, thus familiarizing the English reader with the extremest radical views of German Rationalists. The milder higher criticism of Hastings's "Bible Dictionary" has hardly raised any outcry. In this country, while sporadic attacks have been occasionally made on the liberal utterances of such men as Dr. Rainsford and Professor Bowne, they have attracted little serious attention.—The disturbances in Macedonia are political as well as religious, but in the Caucasus the persecution of the Armenians by the Russian Government, in seizing their ecclesiastical property and assuming control of their schools, illustrates the intolerance of Russian government and gives rise to disturbances that threaten social disorder.—In the Philippines the Aglipay schism from the Roman Catholic Church has grown to surprising dimensions, and it is now uncertain whether the new American bishops will be able to suppress it. They have with them the strength of the old Church, with its rightful claims, and they have much greater skill and wisdom, but the sentiment of the people has been with the native clergy, who have so largely joined the new body. Already the right of the Aglipay priests to the local churches is coming before the courts. The sale of the friars' lands to the United States Government, and their partition among the people, with the removal of the friars, will help the American bishops in their contention with the party of Archbishop Aglipay.

The Commonwealth of Australia

BY SIR FREDERICK W. HOLDER, K.C.M.G., M.P.

[Sir F. W. Holder has had a most distinguished official career. He was twice Premier of South Australia and is now Speaker of the House of Representatives in the first Federal Parliament. He has been a member of the South Australian Government for over ten years, and was a member of the Convention which framed the Constitution of the Commonwealth. At the opening of the first Parliament he was unanimously elected Speaker, and at its close was highly complimented on the great ability and undeviating impartiality with which he had discharged the onerous duties of that singularly difficult position.—EDITOR.]

THE Australian Commonwealth is completing the third year of its history. Its first Parliament has been dissolved. The electoral campaign for a new House of Representatives and half of the Senate is in full swing. In hundreds of public meetings, from Perth to Brisbane, and from Hobart to the Gulf of Carpentaria, the policy of the Government and the acts of the legislature are being reviewed. The time is opportune for complying with a request that has been made to me, to give the readers of THE INDEPENDENT some account of the present situation and how it has developed.

The political atmosphere of Australia is highly electric, for the contest is keen, and because of the liberal franchise all the men and women are entitled to take part in it. Members of the Opposition are fiercely attacking the policy and administration of the Government, while the Ministry and its supporters are equally vehement and energetic in defense. Under such circumstances it is not the easiest thing in the world for one who is in the thick of the fight to adopt a strictly judicial and impartial attitude, but it is evident that in a general survey the coloring of partisanship should be eliminated as thoroughly as possible.

It is undeniable that, taking Australia as a whole, there is a prevailing sensation of disappointment with the results of Federation thus far, and that the Commonwealth idea is not nearly so popular now as it was three years ago. This acknowledgment of one of the most remarkable and unexpected of outstanding facts is not to be taken as an indorsement of the feeling. The questions as to its cause or causes, how far it is justifiable, in what measure it is unreasonable, and the extent to which it is likely to be permanent, are exceedingly interesting, and the trustworthiness of any forecast must largely depend on the correctness of the answers that are obtained thereto. It would be grossly unfair to interpret a sense of dissatisfaction that may be only a passing phase of public sentiment as an evidence that the Commonwealth is a failure.

To begin with, as it is easy to be wise after the fact, the conclusion is reached without difficulty that a considerable reaction was inevitable. The later preparatory stages and the introduction of the new order of things were accompanied by accessories that were calculated to fan enthusiasm to its whitest glow. When the Commonwealth bill was submitted by referendum to the electors public attention was perforce directed to the advantages of the measure, and probably exaggerated ideas were the result. Events in South Africa tended to stimulate the Imperial sentiment and encourage ambition for nationhood. The inaugural ceremonies were conducted amid a blaze of splendid magnificence, and incidentally the coinciding of the birth of the nation with the dawn of the new century tended to further exaltation of feeling. The death of Queen Victoria, the accession of King Edward, the election of the Parliament, kept up the excitement. Then came the opening of the Parliament by royalty in person and the visits of the Duke and Duchess of York to the capitals of all the States, signalized in each instance by a round of festivities. Thus for several months the public mind continued in a state of

effervescence, and subsequent proceedings seemed to be stale, flat and humdrum, producing a sensation as of hopes disappointed and expectations unfulfilled.

Next to this may be placed the reluctant slowness of State Parliaments and Governments to adjust themselves to the new conditions. It had always been represented that the expenses of the Federal legislature and administration would be met by reductions in those of the States, but there was little promptitude in effecting these economies. South Australia set an excellent example by dispensing with a third of its Ministers and members of Parliament, but the larger States, Victoria and New South Wales, postponed such action most tantalizingly. In the former State a Reform act has been passed after intense public agitation, but the latter has done nothing as yet. Hence there is much complaint that Federation has added to the public burdens without any compensating relief, but so far as this is true, the Commonwealth is not to blame.

The introduction of a new and uniform system in certain departments of public affairs, that have been taken over by the Commonwealth, has necessarily somewhat dislocated arrangements, and a certain amount of friction is attributable to this cause. Perhaps it was not altogether avoidable, but possibly it might have been lessened by better management. Anyhow, the transfer had to be effected, and could not be made without some degree of inconvenience and irritation. There are criticisms on both sides, the Government being accused by some opponents with having attempted too much at once and by others with having done too little. Its persistent determination to push things has brought upon it more adverse comment than it would have had to endure had it been contented to make the pace a little slower.

The Federation has been so represented, or rather misrepresented, in some of its acts as to bring upon it unfavorable comment that is undeserved. Its "White Australia" policy, for example, is by no means the embodiment of selfishness and the outcome of narrowness that it has been made to appear. The incident of the six hatters and the restrictions on colored labor have been grossly caricatured, but the impression produced thereby is one of the things to be considered. Public feeling has also been affected by the financial stringency of the times. The Commonwealth has been establishing itself during one of the most trying periods that Australia has ever known resulting from the prolonged and disastrous drought, which is now happily at an end. In individual States, moreover, there are local troubles or grievances to be taken into account. Queensland sugar growers are wroth because of the restraints imposed upon Kanaka labor, altho every care has been taken to protect their industry. New South Wales is angry because its fiscal policy has been set aside. Melbourne instead of Sydney is the seat of the Federal legislature and government, and no decision has been come to about the site of the capital. Western Australia entered the Federation with the understanding that it should be linked to the other States by a transcontinental railway, and is disappointed because the project still hangs fire, altho its own Government is largely responsible for the delay. In all the States local authorities resent the dwarfing of their position by comparison with the overshadowing Federation.

To state the points that have been mentioned is, in many cases, to indicate the inference that is fairly deducible from them. On the whole, it seems only reasonable to conclude that while there has been some cause for the manifest chilling of Federal enthusiasm, most of it is due to natural conditions and the fact that the past may be regarded as a transition period. The great and solid advantages of national unity are as real as ever they were. They have, in fact, been brought out into clearer prominence, and will again irresistibly assert themselves. Provided that the level of administrative capacity and fidelity is maintained and that the authorities of the respective States accept the situation, the temporary alienation—if such it may be

called—will pass away in favor of settled, national, patriotic sentiments.

Considering that three years ago the six States of Australia were self-governing and entirely independent of each other, that the subdivisions and local control still remain for many purposes, that in some cases much rivalry and jealous feeling persistently survives and that the Commonwealth has had to be carved out of such materials, there is abundant ground for the claim that a great deal of good work has been done. The country is both vast and varied, comprising as it does an area of about three millions of square miles, equal to that of the United States, with only four millions of people, settled mainly near the extensive coast lines and on its outer fringe. A political union has been established throughout the entire territory, which is being developed by every successive Federal act into a more real and conscious union, fixing the diverse and sometimes conflicting interests into a harmonious whole. Formidable barriers to intercourse have already been broken down, there is growth in community of feeling and purpose, and this will certainly be widely developed as time goes on.

The Commonwealth has been fortunate in both of its Governors-General, altho the circumstances which led to the early departure of the first were much to be regretted. The Marquis of Linlithgow was all that such a high official should be—able, resourceful, courteous and enthusiastic. Intensely Australian in his sympathies and lavish in his response to every real or supposed demand made upon him, his only fault was that he set up too high a standard of expenditure without a clear understanding of the mind of Parliament, and his premature retirement was the consequence. Lord Tennyson has proved himself a most efficient successor, with a more exact appreciation of the position, and his departure on account of domestic considerations is a subject of unfeigned and general regret.

The Government that was formed by Sir Edward Barton in 1901 practically still continues in office, but has sustained much alteration in its personnel, and its portfolios have several times changed hands. It suffered a severe loss by the death of Sir James Dickson, who had been Premier of Queensland almost at the commencement; parted from its best fighting man when Mr. Kingston resigned on account of a Cabinet disagreement a few months ago, and the Prime Minister himself retired just before the close of the last session, to become one of the Judges of the High Court of the Commonwealth.

The present Prime Minister is the Honorable Alfred Deakin, who is a finished orator, and has been a member of the Ministry from the first. The element of continuity is further strengthened by the continuance in office of Sir George Turner, Sir William Lyne and Sir John Forrest, but it is considered probable that the last named may ere long receive the appointment of High Commissioner, to reside in England and there represent the Commonwealth. Five members of the Cabinet have been Premiers in their respective States, so that the Ministry has a fair amount of administrative talent.

No single achievement of the Parliament was equal in difficulty and importance to the framing of a Federal tariff. The work occupied several months, and when completed was very much of the character of a compromise. The Government and a majority of the members were in favor of protection, but the free traders were strong enough to effect modification of the original proposals at many points. Perhaps the most visible and substantial gain to the community generally through Federation is the abolition of the irritating border custom houses and the establishment of complete interstate free trade. It is likely, however, that the fiscal question will be revived and hold a prominent place at the coming election, for Mr. G. H. Reid, the Leader of the Opposition, has announced that he will fight the battle yet again. The position may be stated briefly thus: The Ministry protest against any interference with the present tariff, on the ground that it will cause injury through occasioning commercial disturbance, but they are willing to meet the Mother Country with reciprocal duties, while

the Opposition by its Leader advocates revision so as to render the customs revenue producing only. Mr. Chamberlain's proposals for preferential trade have introduced additional complications, and whereas the Ministry proposes to meet them by raising the tariff wall a little higher against foreign countries, Mr. Reid argues that as against Great Britain it should be lowered or taken down.

Next in importance to the tariff question may be placed that of the franchise. The Commonwealth Parliament had the duty of framing its own electoral laws, which it discharged in the spirit of its constitution. It established the absolute political equality of the sexes, so that throughout Australia, at the coming elections, every man and woman who is over 21 and unstained by crime will be entitled to vote and all will have equal voting power. The Parliament has, therefore, placed on the statute book what is probably the most liberal electoral law in the world. In most of the States organizations have been called into existence for the political guidance and instruction of women, and in more than one of them ladies have announced their intending candidature for places in Parliament.

Among other useful pieces of legislation has been the establishment of a High Court, which will be of great advantage, not only in interpreting the Constitution, but also to litigants in many cases by rendering unnecessary the costly process of an appeal to the Privy Council of the Empire. At the same time, the court has been so constituted as to enable it to act as arbiter in the many difficult and delicate issues that are liable to be raised between the States and the Commonwealth. The Public Service act, under the provisions of which the employees of all the departments of the Commonwealth are placed, is the most advanced measure of the kind that any Parliament has passed, and removes public servants altogether beyond the reach of political patronage. The Patents act is another useful practical measure that will supersede the Patent laws of the several States, and make it possible for an inventor to get a patent more cheaply for the whole Commonwealth than it was formerly in five individual States out of the six in the union. When Sir Edmund Barton opened the first electoral campaign he issued a manifesto embodying a program of legislative work, and all the subjects included in it, except three, have been disposed of, and two of them were seriously taken in hand.

Evidently the Parliament cannot be charged with lack of diligence. It was in existence for two and a half years, out of which it sat for two years, and was for eighteen months engaged in its first session with only one recess. The House of Representatives deserves credit for some degree of self-sacrifice, having voluntarily parted with six months of its life to save expense to the country. Under the Constitution act one-half of the Senators must retire, and they or their successors be elected by the constituencies, before the first of next January, and in the interests of economy it was arranged that the general election for the House of Representatives should take place at the same time instead of five months later.

This action may be set over against statements that are made as to the Commonwealth being an unnecessary drain on the public funds, and suggests reference to the economies it has rendered possible.

Three great departments—Defense, Post and Telegraphs and Customs—have been transferred bodily to the Commonwealth. These were under separate acts in each of the States, so that there were eighteen acts in all, and as many systems of administration, which have now been reduced to three, or one for each department. In addition to these, four new departments have been created and proved efficient for their work. It is claimed that the cost of Commonwealth management is so much more economical than that of the States, that there is really no comparison. As to the " new expenditure," it worked out for the first year at 13d, and, notwithstanding the cost of the elections and the heavy initial outlay in bringing the new Electoral act into operation, will average for three years only about 18d per head of the population. This is an exceedingly low price to pay for the positive and substantial

benefits that are secured, and it ought to be recouped in part at least by State and departmental economies. The cost of Defense has been cut down by more than £110,000 a year.

The three subjects referred to in the original Barton manifesto, but still left over, are an Arbitration act, an Interstate Commission to regulate railway freights, etc., and the Federal Capital, of which the latter has excited much the largest amount of interest. The situation is peculiar. The Constitution act empowers the Federal Parliament to fix the seat of government in a territory, comprising at least 100 square miles, in the State of New South Wales, but not within 100 miles of Sydney. There are conflicting opinions as to the rights and powers of the State and Federal Parliaments, respectively, and both have done a great deal of inspection. Finally a bill was prepared and a list of sites named on which an exhaustive ballot was taken. The upshot was that the House of Representatives chose one locality, the Senate another; neither would give way, and so the subject was hung up for the next Parliament to tackle.

As to the future, it is evident that there are great subjects to be considered that have at present been scarcely looked at. The administration of New Guinea is one, and the protection of Australian interests in the New Hebrides another. The consolidation of loans is more important than either, for its accomplishment will effect an enormous saving of interest, but the federalizing of the railways must accompany it, for if the liabilities are pooled in any sense, so also must be the assets. Large projects, such as the West Australian Railway, are looming on the horizon. Despite detraction the Commonwealth has made a good beginning. Its first Parliament has tested the soundness of its principles and proved the stability of their foundation.

MELBOURNE, AUSTRALIA.

The Catholic Church in the Philippines

BY JAMES A. LE ROY

[Since this article was written the friar lands have been purchased by the United States Government, a fact which makes this article specially timely. Mr. Le Roy has kept in close touch with Philippine affairs since his service in the islands as private secretary to one of the members of the Philippine Commission. Our readers will recall an article in a late issue of THE INDEPENDENT in which Archbishop Aglipay made a statement as to the meaning of his schism.—EDITOR.]

THERE are various reasons why it is worth while just now to pause and take stock carefully of the religious conditions we have on hand in the Philippine Islands. If we do not, we may at any moment find ourselves surprised by a situation we ought to have foreseen but had not.

One reason is that the Catholic schism in the islands is by no means the unimportant, even amusing, movement that might have been expected from the character of the men who organized it in August, 1902. To be sure, the Associated Press has practically ignored it, and one might well gather, from the hiatus of information upon it for nearly a year, that it had come to naught; but this is not the first time the Associated Press has committed serious errors of omission in regard to the Philippines. Plainly told, the truth of the situation is that the Catholic Church in the Philippines is literally rent in two.

Another reason, closely allied, for turning our attention to this situation, is that Pope Leo's Philippine bull of last December has, where noticed at all in this country, been interpreted entirely too optimistically as bearing on the settlement of the crucial question in the Philippines, the friar question. At any rate, however favorable some of its paragraphs may have read to Americans, in the light of Governor Taft's negotiations at the Vatican, this much is certain: The

Filipinos, even the more conservative, almost unanimously interpreted it as a pro-friar document; and, whether or not we should ascribe this mainly to their attitude of deep-seated suspicion of every move made in the matter of the friars, we must reckon with it as a fact, and we should realize that this opposition to the bull has for nearly a year back given the schism, born of mere agitators, the moral status of a real popular movement.

A third reason has to do with the future. A new Pope is on the scene, and there are a dozen reasons for expecting a more or less new, and, at least, a better defined, "American policy" soon to reveal itself. Confining ourselves entirely to our Philippine difficulties, we might as well frankly realize that, on our own part, we have practically broken with our traditional policy of non-intervention in church matters and that we may have to go still further in this direction before our hands are again entirely free. Governor Taft was not formally an "Ambassador to the Vatican," and it is safe to say we never shall have such a representative there. But, far from being merely a business negotiation about friars' lands, his mission was really a diplomatic mission, by whatever phrase we may choose to call it. And far from implying criticism on it on these grounds, it was the direct, practical, businesslike, American way of dealing with a situation which, whether or no, we had to meet. Had the influence of the orders not been so great at Rome and had the Vatican accepted the drag-net protocol offered it, along with a round sum for the friar lands, conditioned as it was on the definite withdrawal of all regulars from priestly services in the islands, there are many reasons for believing Rome would have preserved her own prestige among the Filipinos, now badly shattered, and it is quite certain that, as a Government, we should, within a few years, have been able to leave the church question out of mind in the Philippines as we do at home. But the Vatican would not go further than to promise verbally to eliminate the regular clergy from the Philippines "as soon as possible." Between the time of Governor Taft's visit and the writing of the Philippine bull, friar interests asserted themselves still more, and that document virtually confirmed the orders in their tenacious hold on the islands where they are no longer welcome; since the publication of that bull in the Philippines, the schism has grown till it comprises one-half of the Christianized population; the orders have, by so long holding their lands at exorbitant prices and by other defiant moves in the face of the Filipinos, greatly complicated Monsignor Guidi's mission of conciliation—in fact, practically rendered it a failure to date; and the outlook is good, as present conditions are, for our having the "religious question" on our hands in the Philippines for a quarter century to come.

The bull, "*Quæ mari sinico,*" has never been analyzed or published in the United States, except in one or two Roman Catholic publications; and, as stated, editorial comments on it were few in number and wide of the mark. It bears date of September 17th, 1902, and was published in the Philippines in December; but it is worth while going back to see what this new "Constitution of the Apostolic Church in the Philippines" is like.

It begins with a historic *résumé* of the Christianization of the islands and the growth of the Philippine Church under Spain, refers to Monsignor Chappelle's mission as one to obtain information merely and alludes with satisfaction to the negotiations opened by Governor Taft, using these significant words in regard to the change of sovereignty from Spain to the United States:

"But as the fate of arms not long since changed the face of public affairs, so, too, it altered that of sacred affairs. This, because, with the surrender by the Spaniards of the sovereignty, there ended also the Patronate of the Kings of Spain; through which the Church has come to acquire greater liberty, and to regain, each entire and unimpaired, its rights."

A graceful compliment to the freedom of religion under American rule, but how will Catholic Spain regard it?

Twelve clauses followed. Abstracted, they are:

"1. The Metropolitan Archbishopric of Manila is retained, and, for better administration, seven suffragan dioceses are created in place of four, the bishoprics of Tuguegarao, Capez

and Zamboanga, being added to those of Cebú, Javo, Nueva Caceres and Nueva Segovia. The Marianas are made an Apostolic Prefecture."

At the time the increase in number of dioceses was made, the Vatican informally promised the appointment of one or more Filipino priests as bishops. Some months ago, it was decided to leave the dioceses as they were before—viz., four in number. Three American Catholics now fill the bishoprics of Cebú, Jaro and Nueva Segovia (at Vigan). It was at first intended to send Monsignor Rooker to Nueva Cáceres, but, at Monsignor Guidi's request, he was sent to Jaro; this at the moment when the Iloilo clergy were threatening to secede if a Filipino was not made bishop. An Augustinian friar, Ramon Gonzalez, a Spaniard, has been administrating the diocese of Nueva Cáceres, and it is the general supposition in the Philippines that he will be formally appointed to this remaining bishopric.

"2. 'Ties of amity and charity' are enjoined between the Archbishop of Manila and the seven subordinate bishops, and frequent episcopal councils are recommended.

"3. Attached to the Metropolitan Cathedral shall be a College of Cañons, ten in number, at the least; and the Apostolic Delegate is to study out the plan for their support, now that that formerly provided by the Spanish Government is taken away. The Pope is 'keenly desirous that Colleges of Cañons be organized also in the other cathedral churches. But while this cannot be brought about, the bishops shall have as Consultors men distinguished for piety, learning and practical experience in affairs, chosen from one or the other clergy.' The consultors are to assist the bishops, as would the cañons, in the sacred ceremonies, and, when prevented, the bishops 'shall supply their places with others of the most worthy of the clergy, secular as well as regular.'"

It is this clause which Filipino critics of the bull interpret as opening the way for the new American bishops to be advised in all matters by friar "Consultors."

"4. Provides for filling temporarily a vacant see.

"5. 'Since experience has fully proved that native clergy is everywhere of great usefulness, the bishops shall endeavor diligently to increase the number of native priests; in such a way, however, that they first prepare themselves for entire piety and obedience to discipline and recognize properly those to whom the ecclesiastical functions are entrusted. And those whom practice and experience shall prove most suitable shall be promoted gradually to the best posts. This, above all, let the members of the clergy understand, that they must never let themselves be carried away by factional passions. For, tho it is in general provisions prohibited that he who labors in the service of God shall mix in secular affairs, nevertheless in the Philippine Islands, by reason of times and things, we understand it to be peculiarly necessary that those who belong to the ecclesiastical State should avoid this. Moreover, since a union of minds is the most important force for the carrying out of any great and useful enterprise, let all the priests, without any exception, whether they belong to the secular clergy or to the religious families, foster this union, for the good of religion. It is certainly necessary that those who constitute the only body of their head Christ do not nourish jealousies among themselves, but rather that they have a singleness of aim, loving one another with the affection of brothers.' As a means of bringing about such a state of affairs and also of instituting and maintaining better discipline, the bishops are enjoined to convoke frequent synodal conventions, to establish spiritual 'retreats' at least once in three years, gathering into them all the clergy, to take especial pains to promote the study of the Scriptures by the priests and to have those who cannot attend, because of location or seasons, perform these exercises in writing."

It is this section of the bull which has particularly roused opposition among the native clergy, who think they are especially picked out for censure; while the opinion is quite generally expressed among Filipinos, as their newspapers show, that this is only a euphonious way of "denying the native clergy its rights." The most favorable Filipino opinion expressed of it has been that it merely repeated, and in terms less strong and definite than usual, promises of secularization of the Philippine Church made at intervals during the past two hundred years.

"6. The bishops are instructed to endeavor to found seminaries for the training of priests [from among the people] in every diocese, and are given detailed warnings about the segregation of such youths from early childhood. To keep up the carefulness of study enjoined, they shall, for a period of five years after being admitted to the priesthood, be submitted to an annual examination. A sort of advanced seminary for young Filipinos is also to be established at Rome, and the bishops are to send there the chosen youths. 'The Holy See will,

on its part, endeavor, by the most elaborate means, to raise the secular clergy to the highest and to the best ecclesiastical equipment, to the end that, at the proper time, it be prepared to replace the regular clergy in the discharge of the pastoral office.'"

Which means the friars are to stay indefinitely, say the Filipinos.

"7. The bishops are further to look out for education in general, having an eye on the teachers and text-books of the 'public schools.' [The context shows that parochial schools are meant.] Special commendation is bestowed on the Dominicans for their maintenance of the 'University of Manila,' which is confirmed in the possession of the title 'Pontifical University.'"

"8. 'The Holy See, improving the opportunity offered by the new order of things in those islands, agreed to make, in fitting time, provisions to enable the members of the religious orders in good will to return to the manner of living proper to their form of establishment, entirely consecrated to the labors of the holy ministry, to the betterment of the good customs of the people, to the increasing of peaceful harmony between civil and religious interests.' It is, therefore, 'most particularly enjoined' on the members of the orders that they fulfill the obligations of their vows, 'giving no one motive for scandal' (2 Cor. vi. 3.) The laws of the cloister are to be inviolably kept, as laid down by Pope Clement XII in 1731, and amplified by Pope Pius VI in 1780. Moreover, the males in religious orders in the Philippines are to render 'all reverence and honor to those whom "the Holy Spirit has established to govern the Church' (Acts xx, 28) [in reference, perhaps, to the many noisy disputes of the past over the refusal of friar priests in the Philippines to permit the visit and inspection of the bishops, or of any but the superiors of their own orders.] A very brief injunction to live in harmony with the secular clergy is given, and it is declared that henceforth there are to be observed in the Philippines the constitution *Firmandis,* promulgated by Benedict XIV in 1744, and the *Romanos Pontifices* of 1881, by which Leo himself decided various points of controversy between the bishops and missionaries of England and Scotland.

"9. The bishops are to decide what parishes shall be assigned to friars, 'in agreement with the prelates of the orders.' Any difference of opinion shall go to the Apostolic Delegate for settlement.

"10. As 'those spiritual exercises commonly called "missions" are of the highest usefulness," they are to be added to the other means for saving souls: which is the preliminary to the provision that at least one house of regulars, with eight members, ought to be established in each province, 'solely to make frequent visits to the cities and towns and cultivate them spiritually with sacred preaching.' In the regions not yet Christianized, such establishments of friars are more strictly enjoined; afterward, when ready for it, apostolic prefectures will be created for these regions. Brotherhoods and sisterhoods are to be formed in each diocese to collect money for this missionary work."

The Filipinos point out that, under Catholic Spain, the places where monasteries could be established outside of Manila were strictly limited to three to each order and the localities preserved.

"11. The strictest discipline is again enjoined on the priests, for which purpose, especially, it is declared, Mgr. Guidi was sent to the islands.

"12. The concluding section begins with a paragraph enjoining charity and proclaiming the paternal love of the Holy See; it closes with a paragraph expressly derogating any other ecclesiastical provisions heretofore ruling in the Philippines, or elsewhere, that are contrary to this bull, declaring null and void any proclamations in its contrary, forbidding anyone to dare to infringe or contradict 'this Our writing of Our erection, constitution, restitution, division, suppression, distribution, aggregation, attribution, decree, mandate and will,' and concluding with this warning: 'And if anyone should presume upon such a transgression, let him know that he shall incur the wrath of Almighty God and of his blessed Apostles, Peter and Paul.'"

In July of 1902 the Vatican, while unwilling to make even a very favorable arrangement relative to ecclesiastical property so long as it was condition on the definite withdrawal of the friars within two years, nevertheless verbally satisfied Governor Taft that its aim was to eliminate the friars from the Philippines and that it would strive to accomplish that end as rapidly as possible—so the Governor stated publicly on his arrival at Manila. In September, when the bull was finally drawn up, the friar party at Rome was still more in control. It is evident, even to the American who reads the foregoing provisions in the most optimistic spirit, that the friars are to remain permanently in the Philippines, unless there is a change in the plan there outlined. We, who in our country have no suspicions of "friar plots," etc., may take the bull to mean

what it apparently says—viz., that the Church is to be securalized gradually and the friars who remain in the Philippines are ultimately to be relegated to the tasks of missionaries among the savage tribes, teachers in the colleges and seminaries, and holders of "missions." Even so, they will retain a very considerable hold upon the Philippines.

But, think as we may about the bull, we may as well face the fact that the Filipinos almost unanimously put the darkest interpretation possible on every clause in it, and regard it as a frankly pro-friar document. As indicated, they call attention to its very brief notice of the services of the native priests and the oft-repeated injunctions about stricter discipline among them, as evidence that the friar view as to the permanent subordination of the native clergy is vindicated; they believe the new American bishops' "consultors" will invariably be friars, who will prejudice them accordingly; they say reform in the seminaries and education of native priests has been promised periodically for two hundred years, with very little result; they regard the authorization of monastic houses of each order in every province as a new means by which friar domination will be fastened upon them; they point to Clause 9 as almost a frank declaration that not only are the friars to continue to administer parishes, but also to continue to rule the Church internally through the bishops; they suspect the prefectures for mission work among the wild tribes of being merely an opening whereby the friars in the islands are to continue to keep their independence of the bishops, etc. In other words, they believe that the Vatican has flatly gone back on its agreement with Governor Taft, and are frankly pessimistic.

The plain truth is that, since its publication in December, the Pope's bull has been the chief cause of the growth of the schism in the Philippines. With incompetent leaders, the Aglipay movement now counts 3,000,000 or more followers, and has its organization in every Christianized province. Moreover, many conservative Filipinos not actively identified with it are openly sympathetic. In addition, a movement frankly hostile to the new American bishops has, directly in consequence of the terms of the bull, lately been agitating the ranks of those Filipinos who remained loyal to Rome. This was the meaning of the revolt in July of all but six of the native priests of the diocese of Iloilo (Jaro) who had not already joined Aglipay. They demanded of Monsignor Guidi the appointment of a native as bishop, instead of the American soon to take charge, and, when he said he could do nothing, organized another schism, the "Philippine Apostolic Church," acknowledging the Pope's supremacy as to dogma, but denouncing it as to discipline, and electing one of their number "Ecclesiastical Governor" of the diocese. More recently, nearly all the native priests of South Ilocos Province, Luzon, have joined this Iloilo movement.

Plainly, the Catholic Church in the Philippines is split asunder. Protestants might says: "All the better." But the Government, which must see neither Protestant nor Catholic, must yet see anything which threatens the preservation of peace and order. Good luck, Governor Taft, and some remnants of Filipino common sense have so far saved the situation from degenerating into semianarchy, as the religious question has been at the bottom of all the troubles in the past in the Philippines. Meanwhile, Filipino officers and people have been going to school to Governor Taft in the elements of civil government in a state where freedom of worship is enforced in the strictest sense. For the first time in the history of those islands, an anti-friar movement, for such the schism is and nothing more, is confined to peaceful methods and is working within legal channels.

Does the solution of the friar question lie herein? Can the people be made fully to understand that they are now under a Government which leaves it entirely to them to support or abandon any minister or worship they have turned against and worship elsewhere or not at all, as they choose? It was because the mass of the Filipinos did not comprehend this, to them, totally new idea, and because the permanence of the hated friars would be interpreted by them as involving the Government's sanction, at least, that Governor Taft undertook the unpre-

cedented negotiations at the Vatican. Lately, there have been indications that he was willing, if the Roman Church was, to let things "drift." If so, that can only be because he feels that the past year's experience with the schism has taught the Filipinos a lesson and has made them care less keenly whether the friars stay or go, seeing they have an easy remedy in their own hands—viz., to disregard them and their ministrations. On such an outcome, our people at home might congratulate themselves, for it would leave the way quite free to return the sooner, in fact as in name, to our traditional policy of non-intervention. Where public order, however, is threatened, a government must take interest. And we must not assume that we have reached this desirable condition of affairs in the Philippines all so soon.

Where such an outcome would leave the Roman Church, is a matter for concern primarily to its rulers. They are in danger of losing their control over the Filipinos, if, indeed, they have not already done so. For Rome to regain there her prestige will require heroic measures, and first the proclamation on the part of Pius X of a different policy from that which Monsignor Guidi was sent out to execute. There are reasons for believing that the latter has more than recommended a more popular course as to the friars. It seems impossible that Rome could ever treat with the schismatic leaders, and yet, unless there is a right-about face, they hold the whiphand over the situation. This particular phase of affairs is not of concern to the American Government as a Government. But even the Protestant citizen of our country cannot view with indifference a too sudden and violent loosing of the ties between the Filipinos and the one great institution of conservatism in the islands. Social progress and individual education we want, to be sure, in a measure and a manner altogether unprecedented hitherto among that people; but there has been of late years so much following after false gods, whether of religious fanaticism or of political demagoguery, that nothing which would increase this social semi-anarchy can be viewed with complacency.

DURANGO, MEXICO.

How We Live to Make Her Go

BY JAMES H. WILLIAMS

[Last week we left Mr. Williams comfortably asleep in his bunk in the forecastle after being shanghaied by the crimps. This yarn describes the life of the sailor on a modern ship. It will be concluded in a subsequent issue.—EDITOR.]

THE old-fashioned deep water sailor was ultra conservative and suspicious of improvements.

He was proud of an oaken keel, and entertained the greatest respect for the man who could raise the loudest chanty on the topsail halliards, and haul out a weather earing quickest and neatest in a gale of wind. He was a hard-faced, hard-fisted practical man, who despised reformers, and regarded all inventions affecting his occupation as lubberly innovations designed by the devil and "Tom Walker" to degrade his honorable title of A. B.

Those famous old packet rats and arch types of the practical sailorman, Garry Owen, "Yankee" Dogle and "Split Nose" Sweeney, never became reconciled to iron ships or steam engines. But they could drive an old wind jammer across the Western Ocean, from New York to Liverpool, in nine days.

With all our modern improvements, I want to see the men and the ship to do it now.

As old Garry Owen himself once remarked in his latter days, while descanting enthusiastically on the departed glory of the clipper epoch:

"Ah! lads, in those days we had wooden ships and iron men." And, then, somewhat dejectedly, after a pause, "Now we have iron ships and *wooden* men."

In that sarcastic touch Old Garry voiced the true sentiment of nine-tenths of the sailor men of his time.

A deep-water sailor was once induced to accept service in a Grand Bank fisherman, for a change. On his return to Gloucester he summed up his impressions of the trip in three disgusting episodes: "Fine weather no fish, bad weather no grog, hard work and no grub." It is safe to assert that he never went fishing again.

From the foregoing it will be seen that the case-hardened shell-back is jealous of his occupation, and that, like all workers, he is suspicious of all labor-saving inventions, even tho they may result in relieving the natural hardships of his life and amplifying the opportunities of his profession.

When I joined a tramp steamship for the first time for a voyage to the Orient, I must confess that I felt rather ill at ease. For several days after going on board I felt like a man in a strange city. I was always making the most ridiculous mistakes and was forever stumbling over some lubberly obstruction about the decks at night. For a day or two I was almost as green as the veriest "ranik," and could even sympathize with the proverbial farmer who went aft on the poop to haul down the flying jib.

On a sailing ship a careless man might stub his toe against a ringbolt at night, or a blind man might do it in the day time, but in that old tramp you could break your shins against the steam pipe screens or the tiller chain channels or steering rods, almost anywhere.

When she was rolling heavy the slippery iron decks were liable to fly up and hit you in the back. And you had to climb three long-legged gangway ladders to get to the wheel. What a lot of nonsense!

When you went aloft there were no crosstrees, and no ratlines above the tops. The rest of the way you had to shin, for there was no topmast rigging except the backstays. The two lower masts were of hollow steel and chiefly intended as support for the eight big cargo-booms. There were also two shorter cargo-booms rigged on Samson-posts amidships.

The two topmasts were of wood and telescoped into the hollow lower masts and fidded through, instead of being sent up outside and fidded forward, as would be the case in a sailing ship.

The ship was provided with steam steering gear, but no wheelhouse. The wheel was situated on the upper bridge amidships, and was nearly surrounded by a teak wood inclosure with a half round front, which the boys called the "witness box." And the man at the wheel was generally referred to as "Jack in the pulpit."

Within this inclosure there was, besides the wheel, a brass indicator to show the position of the rudder, a magnetic compass, a clock and a watch bell. So that the man at the wheel kept the ship's time except at noon, when the time was corrected by the meridian altitude of the sun. Just forward of the witness box stood a large standard binnacle, containing the azimuth, or true compass. The ship's course was always laid by the azimuth compass, but she was steered by the magnetic compass, allowance, of course, being made for variation. On the poop, right at the stern we had a tremendous big hand wheel, by which, with the aid of relieving tackles on the tiller quadrant, the rudder could be controlled in case of accident to our steam steering gear. We had occasion to use this hand apparatus once on the passage out, when our steam steering gear became disabled by the parting of one of the tiller chains. We were in the middle of the Western Ocean at the time, heading about E. by S., with a stiff nor'wester blowing over our port quarter and a high lumpy sea running under our counter to help push us along. Suddenly the ship began to broach, and fell into the trough of the sea, "broadside to," where she lay tumbling about as helplessly as an old tub. As she rolled heavily from beam end to beam end, the big green seas tumbled abroad over both rails, carrying everything before them; then meeting together amidships they would rear up over the high hatch combings with a mighty roar, like wild sea horses on a rampage. Our forecastle wag, Spike Riley, said the ship was overboard, and no one disputed the logic of his profound observation.

By this time the accident to the steering gear had been reported by the officer of the watch to the captain and all hands were called on deck to save the ship.

I might remark, in passing, that this

was the only time in the course of a voyage of nearly seven months' duration that I ever lost a watch below in the service of the ship. In this one respect, at least, sea service on a tramp steamer is far more agreeable than on a big wind jammer, that the sailor gets—under ordinary circumstances, at least, the amount of rest and sleep allotted by nature, as necessary to his health and well being. In a sailing ship we are always sure of our watch on deck, but never sure of our watch below. In too many American sailing ships the just demands of nature are entirely ignored in this respect, and in fine weather their crews are constantly robbed of their sleep without the slightest justification or the ghost of an excuse; while in bad weather no allowance is made for the time necessarily lost—sometimes amounting to hours upon hours of weary, exhausting labor—in the watch below, for the salvation of the ship and cargo and all concerned. In British ships, however, the sailors' right to their watch below is generally respected, and their sleeping time is, as a rule, sacredly observed unless some unusual danger or accident makes the presence of "all hands on deck" an imperative necessity.

Of course in a sailing ship our watch below is frequently interrupted or somewhat shortened by necessary attention to the sails, or the completion of some unexpected maneuver—such as wearing or tacking ship in a contrary wind—this cannot be helped. But in a steamer our motive power is concentrated in the engine compartment instead of being dispersed over 20,000 square yards of space, more or less, between the yards. The watch on deck can always manage the small spread of canvas, and the clew garnets are manned by the engineers. The watch below stays below till eight bells unless something very unusual happens.

The parting of our starboard tiller chains, on the occasion referred to, presented such an emergency, and we all turned our with alacrity in response to the bo'sun's stern call, "All hands on deck."

The first thing to do was to get control of the rudder and get the ship "head to wind" until the chain could be repaired. Watching our chance, each man for himself, we struggled aft, calculating the rolling and pitching of the helmless ship and running the gaunlet of the big green seas, which constantly swept our decks as we went.

Assembling on the poop we proceeded at once to put the hand steering gear in commission and to ship the relieving tackles. These tackles consist of ten-inch double and single blocks, rove full with 4½-inch manila rope, and are always kept in place in beckets along the poop-rails for use in just such an emergency as this. The double blocks are hooked to links at each corner of the enormous iron quadrant which serves for a tiller, and the single blocks are hooked up to strops for that purpose made and provided on the quarter bitts. Three men clap onto the tackle falls on each side and "bowse them up, bar taut."

The strain of the rudder is now on the tackles and the tiller chains are unshackled from the curve of the quadrant. The hand wheel is soon connected with the steering gear, and, manned by three able seamen, the rudder is now under control. The port tackle is gradually slacked away and the slack as gradually taken in on the starboard one, while the wheel is gradually rolled to starboard at the same time. The engines are started to turn at "half speed ahead," and with the helm "a'starboard" she gradually turns out of the trough of the sea and comes head to wind. The trysails are now set to keep her there, and three able seamen are left in charge of the big wheel while four others attend to the relieving tackles. The remainder of the crew are set to work to haul forward the slack of the broken chain so that the engineers can repair it. The broken link is thrown away and a brand new one forged in its place. The new link is chilled and tested and found O.K.

The tiller chains are now reshackled in their respective places, and the strain of the rudder is taken up on the steering engine. The relieving tackles are "come up" with and the hand steering gear is unshipped and released. The man at the wheel is given his course, the engine room is signaled "full speed ahead" once more and we resume our interrupted voyage with only the loss of a

couple of hours' time, and perhaps twenty miles in distance; and, incidentally, one afternoon watch below. Our ship's complement consisted of 36 men all told.

Our captain, commonly called the "Old Man," was a big, fat, red-faced pompous old tyrant, who always seemed highly pleased with himself, and regarded all of us miserable inferiors with an overbearing sneer of eminent disdain.

I don't know that I blame him, for no one but wharf rats and fools ever goes to sea before the mast.

To give Captain Heartless his due, I must acknowledge that he was a splendid seaman, a close and skillful navigator and a painfully astute business manager. I can most truthfully and regretfully attest his unswerving fidelity to his owners' interests. And I can also adduce tangible and indisputable evidence and ample testimony regarding the barbarous way in which he religiously starved and cheated his crew for their aggrandizement and his own renown. May the blight of a bo'sun's curse overtake him yet. Amen!

Our ship carried three mates, who ranked, in the order of rating, as first, second and third.

Their principal occupations at sea seemed to be, to wear brass buttons and walk the bridge; to look important and watch the "tell-tale" compass, to find fault, and blow a tin whistle.

First, in the order of popular appreciation came our second mate. He was a sailing ship graduate, a quiet, capable seaman, and an efficient, tho considerate, officer.

Our third mate was an unfortunate misanthrope, who had missed his calling in life (whatever that was).

His chief claim to distinction lay in his wonderful ability to perform on his official instrument—the tin whistle. He could produce the most ear-splitting, profanity-inspiring shrieks of any man in the business.

In spite of his natural shortcomings, however, he may find some consolation in the thought that if he ever falls overboard his knowledge of seamanship will never drown him.

In my present frame of mind it would be dangerous as well as useless to mention the chief mate's personal characteristics for publication in a respectable journal. He is one of those remarkable fellows who, according to Dickens, must be known to be appreciated. And I should add, the better known the less appreciated.

There were nine sailors, including the historian, all ex-wind jammers, except the two "raniks." The latter may, have been good men before work was invented, but God help them now.

So much has been said to them during the voyage that it would not be manly for me to talk about them here. I have done double duty for them for six months and more, and the owners have pocketed their wages and most of mine, too, so let it be.

The nine firemen in the neighboring forecastle were, like the common run of "lime juice" stokers, hard working, honest fellows, but rather quarrelsome and inordinately fond of grog. But they are the men who do the most "to make her go," and we should not be too hard on them. When we consider the terribly exhausting nature of their inhuman labor we should regard them with pity rather than censure. Even the hard hearted ship owners, who grind fortunes out of the firemen's sweat, admit that their lives are shortened and their mental faculties often unbalanced by the hours of terrible exposure which they must endure in the stoke holes.

We all know that intemperance is most prevalent among the overworked and the unemployed. Then let the fireman rejoice in "a short life and a merry one." It is his only chance to live at all.

Our two apprentices were fine, lively, intelligent boys and good shipmates.

The remainder of our crew was made up of the regulation number of petty officers, engineers, flunkeys and general non-combatants.

The sailors were divided into two watches, just as in a sailing ship, with this exception, that three men were told off as a day gang. They worked all day and had "all night in," and had nothing to do with the lead, log, lights or lookout. They assisted the watch in the handling of sails whenever necessary, but took no trick at the wheel. They

devoted 12 hours per day to general ship's work, and had the other 12 hours to themselves.

The four petty officers—*i.e.*, the bo'sun, lamptrimmer, carpenter and darkeyman—also worked all day with all night below.

The remaining six of us worked watch and watch, three in each watch. We steered the ship by turns, in two-hour tricks; we kept the lookouts, looked after the lead and log lines, and life boat gear, etc. We did the general sailorizing, such as splicing, fitting and repairing ropes and sails, and assisted in the navigation and management of the ship.

In our spare time in our watch on deck we worked with the day gang at whatever occupation they happened to be engaged in. Scrubbing paint off and putting paint on, chipping, or hammering iron rust, and washing and scrubbing decks were our ordinary pastimes while at sea. We observed the customary sea watches of "four hours on" and "four hours off" alternately, day and night, with the usual dog watches, from 4 to 8 p.m. each day.

There are thousands of British ships engaged in American commerce, and if I were asked to describe the treatment generally accorded their crews, I should answer, after eight years' service in this class of ships, first and last, that they are overworked, underfed and seldom paid. I am bound to admit, however, that brutality, or corporal punishment of any kind, is strictly prohibited in British ships generally; and that the rule of "watch and watch" at sea is one of their favorite customs. I wish I could say as much for American ships. The British seaman is nearly always underfed, but it is only in port that he is overworked and, I blush to say, it is only in free America that he is robbed of his wages.

In England a seaman is given ample protection by the "Board of Trade" officials in regard to both shipment and discharge, and no man can meddle with his money or practice any imposition on him without incurring very severe penalties. But in America the seaman who engages in a British ship must give the crimp his first month's pay for the right to labor, and—should the ship return to America—his last month's pay to the owner if he wants to leave.

The scale of provisions so rigorously adhered to in British ships may have been a credit to the forethought of a dead and uncouth age, but it is certainly a disgrace to the twentieth century.

But as these matters are to be the subject of a future article, I will just tuck my ends here, for the present, and take up a new strand.

NEW YORK CITY.

Between the Lines

BY CHARLES BATTELL LOOMIS

AUTHOR OF "A PARTNERSHIP IN MAGIC," ETC.

THE other day I was talking with my friend Adams on the subject of language and I said that the art of innuendo was more easily practiced in French than in English. "In fact," said I, "English is too straightforward to be employed in any such way."

Now, I am not a rhetorician, only a plain, ordinary bank clerk, but I am interested in the study of words, and I felt that what I had said to Adams was eminently just.

A few days later I received the following rambling, but shocking, letter from him:

"MY DEAR BAINBRIDGE:

"Yesterday I saw Arthur Baker. You were speaking about him the other day, and I thought you might like to hear something about him. His clothes looked rather the worse for wear, and he had evidently been drinking and seemed to be under the influence of—something, for he was happy—to put it mildly. I happen to know that he drinks a good deal, and I must say that whatever he once may have been, he is not now the 'glass of fashion or the mold of form.' I may say, without breaking confidence, that he is not likely to be made a member of his firm just yet.

"They tell me that he is rather fond of good company, and I'll wager he doesn't go to bed

at eight o'clock every night. A rather expensive uptown club has housed his form, so I understand. Think of it; he has six children. Can you tell me what their future is likely to be? I have heard on pretty good authority that he is apt to be rather joyful, even at home, and that when his children hear him coming they all run.

"He didn't appear to be in the least ashamed of his course. There's no denying that a man is his own master or else he isn't.

"I should say that Baker was 'enjoying life' —as they say.

"Yours sincerely,
"Jim Adams."

Well, any one can imagine that I was shocked, because I've known Arthur Baker for a good many years and I never suspected him of being a hard drinker. And to think that he was not a model father and that he spent his hard earned salary at clubs, neglected his personal appearance and was staying up till no one knows what time in the morning; I say all these things made a distinctly unpleasant impression on me. But the worst thing was that his children, the little fellows of whom I had heard him speak so fondly, were afraid of him. I determined to go and see his wife and offer my assistance as tactfully as I could.

But before I had a chance to go to Baker's house I met Adams on the street and I said:

"Isn't it awful about poor Baker? When did he begin to go down hill? Can nothing be done to save him and his family? Has drink got an unshakable hold on him?"

Adams looked mystified. "Baker! Arthur Baker, a drunkard? What are you talking about, man?" And then a light seemed to break on him and he said: "By George, I do believe you refer to that crazy letter I wrote to you, that rambling, garrulous discourse on Baker's appearance. But you must have read a meaning into it that I did not intend, for I certainly said nothing derogatory to my good friend Baker."

Then I pulled out the letter and Adams went over it phrase by phrase.

"Yesterday I saw Arthur Baker. His clothes looked rather the worse for wear." (Why shouldn't they? Baker is no dandy, and he's had the suit at least a month.) "He had evidently been drinking." (No doubt of it at all. I saw him wiping the soda water foam off his mustache as he came out of the drug store.) "He seemed to be under the influence of something, for he was happy—to put it mildly." (He *was* under the influence of strong emotion, and he might well be happy—to put it mildly. He had just heard good news from his business house—but of that later.) "I happen to know that he drinks a good deal." (Certainly he does, two quarts and a pint of water every day by the advice of his physician. Excellent for his nerves, so he said.) "I may say without breaking confidence that he is not likely to be made a member of his firm just yet." (Well, no, as he has just been made manager of their largest branch, and that's honor enough for one time.) "They tell me he is rather fond of good company, and I'll wager he doesn't go to bed at eight o'clock every night." (Well, *that* was an *under* statement in both particulars. He is fond of the "very best company," as he calls his wife and children, and so far from going to bed at eight he sits up till ten like a little man every night.) "A rather expensive uptown club has housed his form, so I understand." (That's so, for a friend blew him off to a dinner at his club, and he told me that he could have run his table for a week on what that dinner cost.) "He has six children. Can you tell me what their future is likely to be?" (No, nor can any one else, but it would be safe to bet that if Baker lives they won't have to go to many poor houses.) "He is apt to be rather joyful, even at home, and when his children see him coming they all run." (That's a fact, as you ought to know. Jolliest man I know, and his children run to meet him when they hear him coming.)

"Well," said I, "I did misread and that's a fact, but take the last paragraph, 'I should say that Baker was enjoying life—as they say.'"

"Why, my dear man, why shouldn't he enjoy life with that wife and those boys and no bad habits? The fact is, I've shown you conclusively that English innuendo can do as much mind poisoning as the French variety."

And then I remembered our conversation and we went down to Baker's office and I took both of them out to the swellest lunch I could find in New York.

Fanwood, N. J.

Gulielmopolis

AN HITHERTO UNPUBLISHED POEM

BY WILLIAM CULLEN BRYANT

With Notes By General James Grant Wilson

In a letter, yellow with age, written by Dr. William A. Hallock to his brother Gerard, dated Andover, 23d June, 1823, he says: "The following lines suggest to me so many interesting associations that I cannot avoid giving them a place in this letter. They were written in his sophomore year, in the spring of 1811, by William C. Bryant, and delivered before a Williams College society, as the author was about taking his leave of the institution." On his departure, Bryant left the poem in his room, No. 23, and four years later, when Hallock entered Williams College, it in some way came into his possession, and was found among his papers after his death. So far as known it was the only copy in existence, and has never before been printed. When preparing a volume in 1886 entitled "Bryant and His Friends," the venerable clergyman showed me the severe and satirical production, but a feeling of loyalty to his *alma mater* induced him to decline permitting me to include it in the volume. A decade earlier I heard something of the poem, and when I suggested to Mr. Bryant that it should be printed he said, "Oh, no! it was one of my boyish pranks. I have no copy of the lines, nor do I remember much about them. At the time, I believe, I did not like the dark rooms, the low lying land, and the rigid college regulations, and I suppose I so expressed myself in the verses that Dr. Hallock showed you."

GULIELMOPOLIS.

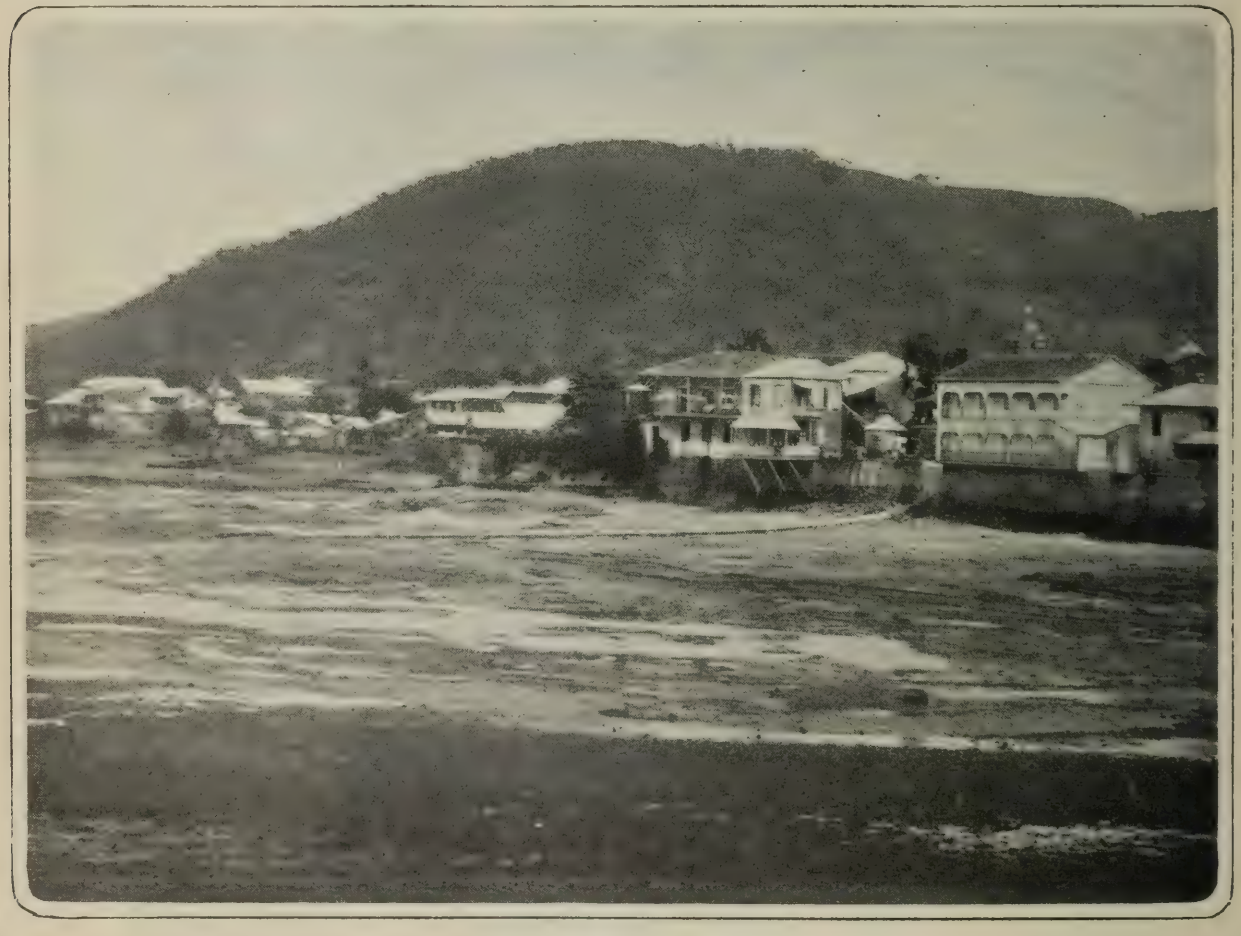
No more the brumal tempest sheds
  Its gathered stores in sleety showers:
Nor yet the vernal season spreads
  Its verdant mantle gemmed with flowers.
But fettered stands the naked year,
And shivers to the chilling air.
And often struggles to unclasp
Reluctant Winter's icy grasp,
    And greet the arms of Spring.
Hemmed in with hills, whose heads aspire,
  Abrupt and rude and hung with woods—
Amidst these vales, I touch the lyre,
  Where devious Hoosac rolls his floods
Dear vales where every pleasure meets!
Fain would I paint thy slimy streets!
Thy soil with churlish guardians blest
And horrors of the bleak Northwest,
    Poured through the chasm afar.
Safe from the morning's golden eye,
  And sheltered from the Western breeze,
There happy regions bosomed lie,
  The seats of joy and bowers of ease.
Fair favored spot! whose fertile breast,
Now draughts with lengthened blaze infest,
Now tempests drench with copious flood,
Alternate heat and cold surprise.

A frozen desert now it lies,
And now a sea of mud.
While rising on the tainted gale,
The morbid exhalations ride,
And hover o'er the unconscious vale,
And sleep upon the mountain's side.
There on her misty car reclined
Disease unseen directs her way;
Wields the black sceptre of her reign
And hurls her shafts with keenest pain,
And singles out her prey.
Why should I sing its turbid springs
That trickle through its rocks of lime!
And why those domes whence Science flings
Her far-diffusing rays sublime!
Where through the horror breathing hall
The pale faced moping students crawl,
Like spectred monuments of wo,
Or studious seek the unwholesome cell
Where dust and gloom and cobwebs dwell
Dark, dirty, dank and low.
Yet over the picture, dark with shade,
Let not the eye of fancy gaze;
Where lawless power her nest has laid,
And stern suspicion treads her maze.
The storm that o'er the wintry West
Rides howling on the Northern blast,
In time will curb its furious way—
But that o'er Hoosac's vale which lowers,
Will never hail serener hours,
Nor open to the day

Like Bryant, Lord Tennyson, in the following sonnet, not, so far as I am aware, included in any collection of his poetical writings, fails to exhibit much veneration for his *alma mater*. In a letter to a friend, Tennyson writes: "I have a great affection for my old University, and can only regret that this spirit of undergraduate irritability against the Cambridge of that day ever found its way into print." The words of the sonnet are these:

"Therefore your Halls, your ancient Colleges,
Your portals statued with old kings and queens,
Your gardens, myriad volumed libraries
Wax-lighted chapels, and rich-carven screens,
Your doctors and your proctors and your deans,
Shall not avail you, when the Day-beam sports
New risen o'er awaken'd Albion—No!
Nor yet your solemn organ-pipes that blow
Melodious thunders thro' your vacant courts
At noon and eve—because your manner sorts
Not with this age wherefrom you stand apart—
Because the lips of little children preach
Against you, you that do profess to teach,
And teach us nothing, feeding not the heart."

Panama and the Panamanians



BY C. L. WITHROW

[Mr. Withrow was for four years a planter in Panama. His observations and experiences acquired there are told in the following article, which is the most comprehensive and interesting on the subject we have yet seen in print.—EDITOR.]

IF one can picture a country where nothing is up to date, where only a narrow margin along the sea coast is opened to civilization, and that civilization of the most crude and primitive type; where square mile upon square mile of the richest and most fertile land on the surface of the globe lies undeveloped, the hunting ground only of wild animals and wandering Indians; where there is not a mile of road or a wheeled vehicle except in the immediate vicinity of the cities of Colon and Panama; one may begin to get a conception of the present condition of the Republic of Panama.

There is probably no spot on the Western Hemisphere, unless it be the State of Yucatan, in Mexico, about which so little is known as this is, the newest of republics. In area, about the size of the State of Indiana, with a total population of less than a quarter of a million, she has developed less than any other of her Latin-American sisters. There is not a single enterprise, industry, or business of any magnitude within her boundaries that has been inaugurated, developed or carried on by her own citizens. Foreign capital, brains and energy have given her everything she has.

The causes of this stagnation are many, the principal one being the constant political troubles that have racked the country since the formation of the United States of Colombia. So bitter has been party feeling, so relentless the persecution of those who differed with the governing party, that the people have

Panama at Low Tide

American Section of Colon

had little time for aught else than fighting and protecting themselves against their political enemies. Now that Panama is free there is every reason to believe that a new dawn will break upon the Isthmus, for in all these years of strife the Panamanians have practically been a unit against the government at Bogota. If they hold together in the future as they have in the past and strive to form a government that will be stable and just, there is no reason why the Republic of Panama should not be the leader of the Latin-American Republics.

The writer lived for four years in the northern end of the Isthmus and had ample opportunity to know and study the people, their characters and methods, therefore, the following account of life in the agricultural section of the Republic may be of interest.

The northern portion of the Republic is mountainous; but on both the Caribbean and Pacific sides the land along the sea coasts and back to the lower slopes of the mountains is wonderfully fertile. On the Caribbean coast the principal industry is growing and exporting bananas. Other branches of tropical agriculture, such as rubber, sarsaparilla and cocoa planting are as yet but sparingly practiced. These will come later when the banana industry has worked itself out. As compared to the other, the banana is of the nature of a temporary crop. It thrives best on the humid land of newly cleared forests; it develops quickly, nine months being the time which elapses between the planting and the reaping of the first crop. After nine months it is a continuous crop until the land plays out, which, on an average, is about six years. The rich alluvial valleys and bottom lands along the river courses last much longer because the freshets replace the plant food consumed so lavishly by the growing trees. The return upon the amount invested is great, the net profit varying from twenty-five to fifty per centum. As compared to this, rubber, sarsaparilla, cocoa and other tropical products take years to develop to the bearing stage, but once successfully started they last a lifetime with but little attention beyond the harvesting of the crop. It is, therefore, easy to understand why the banana industry proves so fascinating to the planter. Unfortunately, when banana

land gives out it is useless forever for banana cultivation, but is valuable for many other forms of agriculture.

Some idea of the virgin forests of the country may be gained from the photograph here shown of one of the Government roads or trails that form a network over the northern portion of the Isthmus. These trails are the only means of intercommunication between the settlements and towns. In the lowlands horses may be used, but in the mountains the trails are too rough for any but the pedestrian. The trails are kept open by the travelers themselves, who keep down the underbrush with their machetes. The land these trails occupy is in no manner reserved for the public use, and when a planter, in extending his plantation, runs across a Government road he treats it with scant consideration, for the next traveling party, if they find the old road impassable, will cut another one.

All land within the Republic is owned by the Government, and by constitutional provision the title to the land can never pass to any one else. All the land is free, and any one may enter upon land that is not actually in cultivation and cultivate it. As long as he occupies the land he may hold it against all comers, his tenure amounting to a lease in perpetuity. There are two exceptions to this rule, one being that with all concessions a tract of land is usually given, this land being described by metes and bounds. Any one holding land within these boundaries at the time the concession is given is protected; but no one may enter upon lands within the concession without the consent of the concessionaire. The other exception is when a holder improves his land by planting such trees as cacoa, rubber, cocoanuts or what may be called permanent crops, the land is never again open to the public occupancy, even if the planter fails to occupy it.

A planter who has taken up and cultivated a tract of land and afterward desires to sell it must supply the purchaser with a title going back to the first cultivation. No notice to the Government is necessary in the first entry upon the land; it is only when the planter sells that he makes his declaration that he found the land in a virgin state and unoccupied. The document, which is usually long and verbose, describes only the nature of the improvements, both as to crops and buildings situated upon land specifically described. No mention is made as to ownership in the land. These transfers

Street in Boras del Toro

are recorded in the Government records, while the original goes to the purchaser. Should be in turn sell, he turns over his papers to the new owner with his own conveyance added thereto.

This method of transfer, while sufficient to protect one in the transaction of ordinary business, has a very injurious effect upon the prosperity of the country. It probably accounts for the roving proclivities of the population, for when all land is free and open one may wander from place to place as the spirit moves him. The native planter usually contents himself with a thatch house, material for which is always at hand in the forest, and should he decide to move somewhere else to avoid military service, taxation or possibly arrest for some infringement of the laws, he is nothing out of pocket except the time devoted to putting up his shelter. As a general rule he plants only enough to supply himself and family with food, depending upon his rifle or upon rubber or sarsaparilla gathering for such money as he needs.

In Costa Rica, Panama's neighbor on the north, the land is sold to the individual by the Government, and this land may be confiscated for offenses against the State. The result is that revolutions are almost unknown and the country is developed far in excess of any other republic in the antipodes.

The farmer in Panama has no possession of the soil except in so far as it is necessary for the cultivation of his crop.

Type of Plantation Home on Big Plantations

Should he find gold or other precious metal, or coal or other commodity in the ground, he cannot develop it without paying the individual who owns the particular concession involved; for mining of all descriptions, salt evaporating, the sale of liquors and tobaccos, gambling, pearl fishing, turtle fishing, the growing of certain products within certain boundaries are concessions for which the Government receives a lump sum at regular intervals. The Government protects its concessionaires vigorously, and any article of concessionary proprietorship is contraband unless bought of the concessionaire. It is needless to add that smuggling is widely practiced. In some districts it is openly countenanced, for the Government officials are paid at irregular intervals, and even Government officials must live. In one of these localities a member of the police force finding his pay days few and far between, resigned

Government Road in the Forest

his official position and set himself up as a smuggler. He soon waxed fat and prosperous and opened a saloon. On one occasion he was introduced to an American visitor as one of the prosperous merchants of the town. The American was impressed and inquired as to the line of business the merchant carried on. "I am, Señor," replied the ex-policeman, "the proprietor of the largest contraband store in the town."

The mountain section of the Republic is almost unsettled. It is accessible only by the trails before mentioned, and only the adventurous visit it unless compelled to do so by necessity. At present its resources are but little known. On the lower slopes of the mountain, practically in the foothills, are rich deposits of good coal. There is scarcely a creek that does not show to the prospector color of gold. Manganese and quicksilver have been found and will doubtless be mined and exported when the facilities for bringing them to the coast are perfected. Stones resembling the opal have been found, and there are no doubt other riches not now discovered in this region. Above the ground are precious woods, dyes and rare orchids. Vast savannahs, affording acres of pasturage and suitable for every branch of farming, are to be found in the plateaux on both the eastern and western side of the higher Corderilla. Near Boqueta and David are coffee plantations—small now because of the difficulty of marketing the product, but rich in promise. The climate of this section is ideal. Crops that ripen in the temperate zone in the summer and early fall may be successfully grown for twelve months in the year. The nights are cool and restful, the days delightful. David is a town of some size, being the seat of government of the province of Chiriqui. Boqueta is a settlement of foreigners, mostly Americans and Germans.

The Pacific Slope is more densely populated than the eastern side of the mountains. Cattle grazing is the principal industry, altho agriculture is extensively carried on.

The fact that the eastern side of the country was not regularly opened to commerce until the banana industry developed, less than twenty years ago, accounts for the difference in the development of the two sides. Panama was a city before any of the Caribbean towns was thought of; the Pacific coast was developed half a century ago, at least.

The inhabitants of the northern end of the Isthmus are a combination of Spanish and Indian. The principal tribe are the Chiriqui Indians or Chiriquonis. They have their homes in the western slope of the mountains, but are found in great numbers on the eastern slope, where they come to work in the plantations and to sell the sarsaparilla and rubber they gather on the mountain slopes. They are small in stature, thick set and possessed of great physical strength. They seem to have none of the characteristics which marked our American Indians. Their complexions are yellowish, their eyes and hair black. They are in no wise home makers, roaming from one side of the country to the other, and few of them are planters. The women in their youth make some pretense to looks, but they fade rapidly and at thirty are old women.

On Sundays and feast days the men array themslves in white shirts with bosoms of red or blue, or both combined; about their heads they bind a white band that gives them the appearance of suffering from a severe headache; their faces are decorated with lines of color, or with rows of little pigs in red, blue and white. They are hard drinkers, but when in liquor are not vicious, confining their quarreling to boasts, threats and argument. They have but little treachery in their makeup, and when sober are, as a class, kind but very reserved. Money is not an essential to their happiness; it is rather in the nature of a convenience with which to gratify their immediate fancies. Where they can be prevailed upon to work they make excellent laborers, willing, industrious and, for the most part, thorough, vastly superior to the Jamaican negroes, who constitute the laboring class of the Republic. But unfortunately they are not always ready or willing to work. The average day's wage of an Indian is about seventy cents silver (equivalent to about thirty cents U. S. currency), but even the promise of twice that amount would not tempt one of them to work if he was not of the mind to do so.

On one occasion the writer, being short handed, determined to try Indian labor, with the following result: The Indians

Native Shack

were about thirty miles away, at a settlement at the head of the Chiriqamola (pronounced Crickamola) River, and thence was dispatched a canoe in charge of a trusted employee. Four days later the canoe returned with some twenty Indian boys and youths. The man in charge of the boat had great difficulty in prevailing upon the chief to let the boys come, and finally had been compelled to agree to the following conditions: The men were to be returned to their settlement at the end of twenty days without expense to them. They were to be supplied with a specified ration of rice, green bananas and native chocolate. They were to receive eighty cents in silver per day, and were only to do machete work. A few other conditions of minor import completed the list. For ten days the Indians worked like Trojans in the bush and were apparently happy and contented, but suddenly on the afternoon of the tenth day they appeared at the commissary and asked to be paid off and sent home. The only excuse was that they wanted to see their families, and no argument could shake their resolve. On being informed that they would be sent, each man produced a small piece of twine, in which was tied a knot for each day he had worked, this being the Chiriquoni's method of bookkeeping. The formality of payment being ended each one began to spend his money, and when they left, there was probably not ten dollars in the crowd. Machetes, calicoes, wearing apparel, eatables, plates, cups, knives and spoons were the principal purchases, and each member of the party also supplied himself with tobacco and liquid refreshment. Several days later when the canoe again returned the writer found that his experiment with cheap labor had cost him more than ordinary labor would have cost.

One amusing trait of the Chiriquoni character is his dependence upon his employer in all matters. One planter had an Indian boy who invariably asked for instructions on all occasions. This boy slept in a thatch house quite near the plantation house, and one night during a gale the house blew down. The planter hearing the crash, rushed out to see what damage had been done. As he neared the wreck, he heard the boy from underneath the ruins says:

"Suppose me house blow down, what me do?"

The southern portion of the Republic does not approach the northern end in either the hight of the mountains, its sanitary conditions or the fertility of its soil. The land to the south of the canal zone is swampy and malarial. Some bananas are produced in this section, but the total output is small compared to the Chiriqui Lagoon region.

Native Method of Cutting Bananas

The town of Colon is the most unhealthy city in the Republic. It is almost one of the most desolate looking places on earth. The two most attractive features of the place are the American town, where the employees of the Panama Railroad have their homes, and the French Canal town, where the houses built for the canal headquarters's staff cluster near the mansions built by the elder de Lesseps and his son, and in front of which stands a beautiful statue to Christopher Columbus. The writer one day was admiring this work of art when the Jamaican "cabby," who was showing him the sights of Colon, stepped up and said:

"Dat was a great man, sah," pointing to the statue.

"Is that Mr. de Lesseps?" the writer innocently asked.

"No, sah," was the reply, "dat's Mr. Christofer Columbus, de man who discobered dis canal. He was the greatest man that was ever in the discoberin' business. He discober Jamaica."

Statue to Christopher Columbus; Erected by the French Canal Company, in Front of the de Lesseps Mansion Opposite the Mouth of the Canal

"Is he the same man that discovered America?"

"I dunno, sah, I never heard; but he discobered Jamaica, and den he sails ober here, and when he about three miles out there," pointing to the blue Caribbean, "he see dis place and he come in here and land right where he is now."

"Who is the lady with him?"

"Ah, dat's jes a lady what come out of the bush ober dere," indicating the mountains, "when he was discoberin' dis place and she go with him and help him discober dat canal ober dere."

It would seem that we Americans owe Columbus a greater debt than we imagine.

The city of Panama is the only distinctly Spanish-American city in the Republic. Little has been done in the way of introducing modern improvements. The street cars are propelled by electricity, but run only at intervals of several hours. The streets are paved with stone, but are narrow and dirty. The section of the city bordering upon the Bay of Panama is the most picturesque and contains some interesting ruins. The Chiriqui Plaza, which figures on the scene of the recent revolt, is in a corner of the city and is in reality a fortified point commanding the approach to the city from the bay. The photograph here shown was taken about a year ago, on the occasion of the execution of Victoriano Lorenzo, a Chiriquoni chief, who took up arms against the Colombian Government in the last revolution. He was one of the most noted of the Liberal generals, but his lexicon of warfare contained no such word as mercy. His course was marked with cruel and often treacherous murders of military prisoners, and after the revolution ended he was tried by court martial and publicly executed.

The whole western coast of Central America is noted for the rise and fall of its tides. At Panama, the rise and fall is about 30 feet. On the eastern coast the rise and fall of the tide seldom exceeds three feet. Two photographs are here shown, showing the Bay of Panama at both extremities of the tide.

Boca del Toro in the Chiriqui Lagoons is the third most important town on the Isthmus of Panama. In many ways it is the richest of all the centers of commerce. It is situated in the heart of the banana producing region, and from it

are exported yearly hundreds of thousands bunches of this fruit. The regular population of the town is about 3,000, but when the working force of the plantations which surround it is taken into account, the population is nearly three times the amount named. Boca del Toro to-day is a town of great importance in the Republic, but its career is only begun. Later, when the vast coal deposits in its vicinity are developed and the canal is completed, the Chiriqui Lagoons will be a port of call for steamers bound from European ports to the Far East. These lagoons, three in number, are large enough to furnish safe harbor for the entire naval flotilla of the world all at one time. They constitute the only natural harbor in the Caribbean coast from Cartagena in Colombia to Bluefields, Nicaragua. The proposed harbor at the mouth of the Fox River at Colon will be an artificial one and one that will require high engineering skill to develop.

Typical Indian Boy; a Native Kitchen Appears in the Background

Aside from the coal deposits, the Chiriqui Lagoons promise much as the logical terminus of the railroad and other facilities which will open the interior of the country to the markets of the world. The wide range of the products of which the country is capable will add to the importance of the place as a resting place for vessels bound to the other side of the world. The fact that all the coal used and available in Colon is imported and the utter unsuitability of the country in the immediate neighborhood for extensive agricultural development simply serve to add force to the foregoing statement.

The principal Indian tribe of the country has already been referred to, but nothing has been said about the general population, the people who inhabit the towns and cities, and who now must bear the general name of Panamanians. One approaches a description of these people with a great degree of hesitation, for his account cannot be a description of a nation but of a composite of all nations. The general type, of course, is Spanish, but with this is mixed American, English, French, Chinese, German and negro blood. As is usual the world over, the admixture of foreign elements seems to develop and perpetuate the bad characteristics of the elements combined. Judged from the American standpoint, the people of the Isthmus appear lazy and shiftless, but the writer believes that these defects are explainable when the turbulent history of the Isthmus during the past half century is considered. It is a noticeable fact, in the instances where natives and foreigners have embarked in joint business enterprises, that the native has developed into a good business man. The reason for this is doubtless the fact that the combating forces have always hesitated in interfering with any business where there was a foreign element, fearful lest international complications would arise. As a general rule the foreigner who keeps hands off the politics of the country is as free from annoyance as he would be in his native land.

The bulk of the labor of the country is done by Jamaica negroes, and these constitute a very numerous and undesirable element in the population. They are ignorant, superstitious, and arrogant, willing to work only when the spirit moves them, and never under any circumstances to be depended upon. They gained their foothold in the Isthmus in

the old canal days, and they remained there, waiting for the work on the great waterway to begin anew.

The Chinese actually overrun the country, monopolizing the smaller branches of trade. They are content with so small a margin of profit and live for so little money that they are enabled to outdo any competitor. Every cent they save is hoarded for transmission back to China, and consequently they do the country no good. In Costa Rica, where Chinese exclusion is rigidly enforced, the improvement over the conditions existing in Panama is readily noticeable.

Each of the Colombia States reserves the right to issue its own postage stamps and to collect certain of its revenues. The currency of the country was issued by the general Government, and in the department of Panama the medium of exchange was wholly silver coinage in denominations of fifty, twenty, ten and five centavos. The rate of exchange for American gold varied from 130 to 160 per cent. premium, making an American dollar equivalent to from $2.30 to $2.60 of Colombian money. For convenience in handling the fifty-cent pieces were always put up in rolls of fifty, and in many instances these rolls pass through numerous hands without being opened. In the northern end of the Republic there are no banks, but many of the business houses accept deposits and allow the issuing of drafts or checks, which are payable on sight. In this way much handling of the medium of the country is avoided.

It seems rather paradoxical to find a language other than the language of the locality the medium of communication, but such is the fact in Panama. The

Native Soldiers; the Boy in the Center is a Corporal

official language of the country is, of course, Spanish, and this is the language of the courts and official records. The commercial language is English. Every one speaks English, and it is the native who has not mastered the language that finds himself at a disadvantage rather than the foreigner.

PUTNAM, CONN.

King Assarhaddon

BY COUNT LEO TOLSTOY

[The following legend was written for the Kishineff Relief Committee by Count Tolstoy, and has been translated for THE INDEPENDENT by David B. Macgowan.—EDITOR.]

ASSARHADDON, King of Assyria, had defeated King Lailie and conquered his kingdom, destroyed and burned all his cities, deported all the inhabitants to his own country, slain his warriors to the last man and had put King Lailie himself into a cage.

Stretched on his bed at night, King Assarhaddon was revolving in his mind what manner of death he would inflict upon Lailie, when he suddenly heard a rustling noise close by him. He opened his eyes and saw an old man, with a long gray beard and mild eyes.

"Thou wilt have Lailie executed?" asked the old man.

"Yes," answered the King. "Only I have not yet decided how I shall put him to death."

"But thou art Lailie thyself!" the old man said.

"That is not so," said the King. "I am I, and Lailie is Lailie."

"Thou and Lailie are one," said the old man. "It only seems to thee that thou art not Lailie and that Lailie is not thou."

"How canst thou say that it only seems so to me?" asked the King. "I am lying here on this soft bed, surrounded by obedient slaves and serving women, and to-morrow I shall feast with my friends just as I did to-day. But Lailie is caged like a bird, and to-morrow he shall be impaled and shall writhe with his tongue hanging out until he perishes, and the dogs will tear his body to pieces."

"Thou art not able to destroy his life," said the old man.

"But the fourteen thousand warriors that I have slain, of whose bodies I made a great hill?" asked the King. "I am living, but they are no more; therefore I am able to destroy life."

"Why dost thou think they are no more?"

"Because I do not see them. Above all, they were in pain and I was not; they were wretched and I was happy."

"This also only seems so to thee. Thou hast tortured thyself, not them."

"I do not comprehend thy words," said the King.

"Wilt thou comprehend them?"

"Yes."

"Then come hither!" said the old man, and he pointed to a basin filled with water. "Put off thy clothes and step into the basin!"

Assarhaddon did as the old man bade him.

"As soon as I begin to pour this water over thee, thou must dip thy head under," said the old man, as he filled a pitcher with water.

The old man raised the pitcher over the King's head, and the King put his head under the water of the basin.

And hardly was King Assarhaddon under the water when he felt that he was no longer Assarhaddon, but another man. And as he thus suddenly feels that he is this other man, he sees that he is lying on a splendid bed beside a beautiful woman. He had never seen this woman before, but he knows that she is his wife.

The woman rises and says: " Lailie, my dear husband! thou wast wearied by thy labors yesterday and hast slept longer than thy wont, but I have watched over thy slumber and have not waked thee. But now the princes are waiting for thee in the great hall. Clothe thyself and go in to them! "

And Assarhaddon, who realized from these words that he is Lailie, wonders not at all thereat, but wonders rather that he has known nothing about it before. And he arises, clothes himself and goes into the great hall, where the princes await him.

The princes incline themselves to the ground before their King Lailie, then stand up and seat themselves before him upon his command. The eldest of the princes begins now to say that the insults of the wicked King Assarhaddon should no longer be endured, but should be answered upon the field of battle. Lailie does not agree to this, but commands that ambassadors be sent to Assarhaddon to reason with him, and dismisses the princes. He appoints a number of notable men as ambassadors, and instructs them carefully what they shall say to Assarhaddon, and how they shall conduct themselves. Then he goes hunting, his favorite pastime, and has the good fortune on this day to kill an old lioness and to take her two cubs alive. After the close he feasts with his followers, is regaled with music and dancing and passed the night with his beloved wife.

So lives he days and weeks, and awaits the return of the ambassadors that he has sent to that King Assarhaddon, whom he himself used to be. They return after a month with their noses and ears cut off.

King Assarhaddon announces to Lailie that he shall fare as did his ambassadors unless he at once sends the tribute of gold, silver and cypress-wood imposed upon him and appears in person to do obeisance to Assarhaddon.

Lailie, who had once been Assarhaddon, again summons the princes and takes counsel with them what is to be done. All are of the same mind that, instead of waiting for Assarhaddon's attack, war should be declared against him at once. The King agrees with them this time, and heads his army against Assarhaddon. The march lasts seven days, and the King arrays his forces and rouses the courage of his warriors. On the eighth day his army meets Assarhaddon's army in a broad plain on the river bank. Bravely fight Lailie's warriors, but Lailie, who used to be Assarhaddon, sees how the enemy's hosts hasten down from the mountains like ants and overrun the plain and gain the upper hand over his troops. He plunges in his chariot into the midst of the tumult of the battle, and lets his sword crash down upon the enemies. But Lailie's warriors are counted by hundreds and Assarhaddon's by thousands, and Lailie feels that he is wounded and is being carried away a captive.

For nine days he marches in chains with the other prisoners led by Assarhaddon's warriors. On the tenth day he is brought to Nineveh and put into a cage. Deep is Lailie's suffering, not so much from hunger and his wounds, as from the shame that is put upon him and from his impotent wrath. He sees no possibility of repaying the enemy all the evils that he is enduring. For twenty days he sits in his cage and waits for his execution. He sees his friends and relatives brought to the scaffold, and hears the lamentations of the tortured victims, who are skinned alive or have their arms and legs cut off, and betrays neither sympathy nor fear. He sees his beloved wife led away in chains by eunuchs. He knows she is being taken to Assarhaddon to be his slave. This, too, he endures without complaints. But lo, two executioners now open his cage and, having bound his fetters tighter on his back, lead him away to the bloody scaffold. Lailie sees the sharp stake dripping with blood, which has just been drawn from the lifeless corpse of his dearest friend, and he understands that his turn has come. His clothes are taken off. Lailie is affrighted at the sight of his emaciated body, once so strong and shapely. The two executioners seize him by his withered hips, lift him up, and are about to impale him upon the stake.

" Now I shall die," Lailie thinks, and,

forgetful of his resolve to remain stoically brave to the last, he sobs loudly and prays for mercy. But nobody hears him.

"But that cannot be so," he thinks, "surely I am asleep and it is only a dream," and he tries to wake. "But I am not Lailie, I am Assarhaddon," he thinks.

"Thou art Lailie, and thou art also Assarhaddon," he hears a voice say; he feels the agony of death beginning. He shrieks and in the same instant lifts his head out of the water. The old man is bending over him and is pouring the last of the water from the pitcher upon his head.

"Oh, what torments I have suffered, and how long they endured!" Assarhaddon exclaims.

"How long?" the old man asks. "Thou hast merely dipped thy head beneath the water and immediately raised it up again. Look! all the water has not yet flowed from the pitcher. Hast thou understood?"

Assarhaddon does not answer, but gazes upon the old man with fear.

"Hast thou understood," the old man continues, "that Lailie is none other than thyself and that the warriors, too, whom thou hast delivered unto death are none other than thou? And not alone the warriors, but also the beasts that thou hast slain in the chase and hast eaten in thy feasts; they, too, are thyself. Thou hast believed that life is in thee alone, but I have taken the scales of blindness from thine eyes and thou hast seen that when thou dost ill to others thou dost it only to thyself. ONE LIFE, one and undivided, is in all, and only a part of this one, undivided, life is revealed in thee, and only in this one part of life canst thou perfect, fritter away, increase or diminish life, and thou art able to perfect the life in thee only by tearing down the barriers that part thy life from the life of the other beings, by taking the other beings for thyself, by loving them. To destroy the life in other beings does not lie in thy power. The life of the beings that thou hast killed has only been removed from thy view, but not destroyed. For Life exist neither Time nor Space. Life is a moment and Life is a series of eras, and thy life and the life of all visible and invisible beings of the world is the same. It is impossible to destroy life or to change it, as it is one and undivided. All else is delusion and deception."

With these words the old man vanished.

The next morning King Assarhaddon set Lailie and all the other prisoners free and stopped the executions.

Three days afterward he summoned his son, Assurbanihabal, and gave his scepter over to him and he himself went into the wilderness to reflect about what he had heard. And then he went as a pilgrim from city to city, and from village to village, and proclaimed to men that there is only ONE LIFE, and that men only do themselves harm when they mean to harm other beings.

YASNAYA POLIANA, RUSSIA.

Literature

The Home

Our modern surgeons get bolder and bolder in the practice of successful extirpation, and each year we hear that some organ formerly regarded as necessary can be dispensed with without serious injury. Not only can the vermiform appendix be amputated to advantage and limbs be lost without material inconvenience, but it seems that the stomach is not an indispensable organ and that quarter sections, to say the least, of our brains, livers, lungs, etc., can be taken from us and we would not miss them. That last refuge of the ego, the pineal gland, proves to be a superfluous vestige of creation, and when it is cut out we are none the wiser. We cannot doubt these triumphs of surgical skill, yet sometimes we wonder what would become of a man if all these superfluities should be taken from him.

CHARLOTTE PERKINS GILMAN

Something of the same feeling comes over us when we read the attack made by the "higher critics" of sociology on the institutions and conventions which we have considered necessary to civilization. We hear it argued with a brilliancy we are forced to admire and with a cogency we cannot altogether evade that patriotism is selfishness, that charity is pauperization, that property is robbery, that marriage is tyranny, government is unjust, and religion is superstition, still we are unwilling to sacrifice these and all the other things which are so vulnerable to the scalpel of the critic, lest some of them should happen to have unsuspected utility.

Like the surgeons who can take off a limb easily, but cannot add to us a third arm, altho this would be very useful, most social reformers are much more successful in the destructive than in the constructive part of their work. With the iconoclastic school we must, despite her protest, class Mrs. Gilman for her recent book on *The Home* * points out clearly and sharply the defects in that institution, but only vaguely suggests what is to take its place.

Her skill in detecting weak points, and her keen satire remind one of Schopenhauer, Hartman, Nordau and Veblen, but she has also an adroitness of repartee which—altho we dislike to say anything which is so offensive to the author—is delightfully feminine. As an example this may serve:

> "Some hold that the feebleness of woman has a beneficent effect on man, draws out many of his nobler qualities. He should then marry a bed-ridden invalid—a purblind idiot—and draw them all out."

Mrs. Gilman considers "home-making" from its economic side, as "the running of the commissary and dormitory departments of life, with elaborate lavatory processes," and shows how imperfectly it fills its accredited functions of securing privacy, healthfulness, peace,

* The Home: Its Work and Influence. *By Charlotte Perkins Gilman.* New York: McClure, Phillips & Co. $1.50 net.

comfort and the conditions suitable for rearing children. To use her own statement:

"The home, as now existing, costs three times what is necessary to meet the same needs. It involves the further waste of nearly half the world's labor. It maintains a low grade of womanhood, overworked or lazy: it checks the social development of men as well as women, and, most of all, of children. The man, in order to meet this unnecessary expense, must cater to the existing market; and the existing market is mainly this same home, with its crude tastes and limitless appetites. There the man, to maintain his own woman in idleness, or low-grade labor, must work three times as hard as is needful, to meet the demands of similar women: the home-bound woman clogging the whole world.

"Change this order. Set the woman on her own feet, as a free, intelligent, able human being, quite capable of putting into the world more than she takes out, of being a producer as well as a consumer. Put these poor, antiquated 'domestic industries' into the archives of past history; and let efficient modern industries take their place."

There is much truth in this. Woman's work has been largely taken from her and she must follow it or spend her time in idleness, frivolity or useless labor, and to say, as many now do, that it increases the wealth of the world to have women waste their time is one of the most dangerous fallacies of our time, but we must submit to the ignominy of being called "Mesozoic men," by saying that no satisfactory substitute for the old-fashioned home in many of its most important activities is yet in sight. We accept the fact which has been forced upon our notice by sundry bill-boards that breakfast foods can be better prepared in the factory than at home; we have long since given up wearing homespun cloth and home-made clothes; and just as soon as there is an establishment on the corner supplying ready-cooked meals we will patronize it, but until then we will act according to the proverb, "a bird in the hand is worth two in the bush."

There are certain stubborn facts which Mrs. Gilman steadily ignores. She insists that she means no attack on the integrity of the home in urging that a woman's real life work should lie outside of it. Yet she must know that long periods of seclusion are necessary to a mother and that few professions could be carried on successfully under a series of such interruptions. Somewhere between the standpoint of the German pessimistic philosophy, that woman is a bundle of enigmas, and all these have but one answer, motherhood; and Mrs. Gilman's position that motherhood is but an incident in woman's career, the golden mean is to be found. She proves that the old-fashioned, independent household, with its domestic industries, is not an ideal place for bringing up children, either hygienically or educationally, but the city apartment house, with its absence of "housework," with meals eaten in a restaurant and both father and mother absent from it all day, which is as near as we have yet come to realizing her substitute, is still worse for children, so much so that most couples so circumstanced dispense with children altogether.

The professional trained nurse has not yet proved herself equal to the amateurish but loving mother, and we do not expect she ever will equal the trained mother. One of the largest orphanages in the country has found it much better for the health and happiness of the children to scatter them among families of the neighborhood than to keep them in the institution under conditions theorectically more perfect.

From an article by the author published in THE INDEPENDENT last summer, "All the World to Her," our readers know her opinion that a home, a husband and children cannot fill the life of "a full-statured woman," or, as Will Carleton expressed it, "You ain't all the folks she wants to know." She finds a horrible example right to her hand in "the morbid Marna in the 'Confessions of a Wife'—a vivid expression of what it is to be a highly concentrated, double-distilled wife—and nothing else. No shadow of interest had she in life except this man; no duty, no pleasure, no use, no ambition, no religion, no business—nothing whatever but one embodied demand for her Man. He was indeed all the world to her—and he didn't like it."

We are obliged to confess that "Our Country" does not touch as deep a chord in us as "Home, Sweet Home," and our altruism is not yet so well developed that we are ready to throw open the doors of the home in the hope of warming all out-

doors. If that be selfishness, make the most of it.

My Mamie Rose*

GENIUS is always extraordinary, but it is not a gift that belongs exclusively to the moral or refined members of society. It is a mental intensity or perversity that may show in the antic rascality of a gutter snipe, in the thief's cunning or in the drunken ferocity of a tenement house Caliban. And for this reason the fact that a "Bowery Kipling" should discover in himself a genius for literary expression is no more remarkable than many other forms of Bowery genius. But when, after subsisting for thirty years upon the sin and slime of that locality, he so far outwits predestination as to become morally sane, spiritually clean, that is a matter of importance, an event with which those interested in the development of the species must co-ordinate the facts of science. Indeed, those who affirm that what a man is or thinks, or does results from his environment must enlarge the definition of that term, or recognize in the author of *My Mamie Rose* an unaccountable heresy. According to their doctrines, Mr. Kildare's hasty evolution is unwarranted, and as taxing upon credulity as is the story of the compounding of the "first man" related in Genesis. Yet the miracle in this instance is written out with autobiographical accuracy, which is a clear advantage that Mr. Kildare has over Adam, whose memory began only after he was finished! Somehow, known only to himself, to Mamie Rose and to the good God, he really did ascend out of the dive depths on the Bowery in a very short period of time far enough to acquire the virtues, opinions, consciousness and everything else which is supposed to belong only to the best-bred men among us, with the possible exception of personal reserve.

After giving a moving account of his infancy in a tenement house, of his struggles as a street waif selling papers, learning vice and the most vicious methods of self defense, he relates how these methods became offensive as his muscles strengthened, so that he became the leader of his "gang." At the age of eighteen, his splendid physique and ferocity attracted the attention of passing "sports," and for the next ten years he was a prize fighter famed for his rage and brutality in the ring, a "bouncer" in low resorts and a general guide to iniquity to all who followed him.

From this point the book becomes sensational, not so much in its revelations of the Bowery world of crime and obscenity, as in the exposure made of the close relationship to it sustained by the better elements of society. The general impression prevails that "slumming" is a sort of pharisaical curiosity indulged by the wealthy or sentimentally good more or less at the expense of the poor and vicious; but that young women of good families and unquestionable social rank should come night after night with their escorts into the lowest dives on the Bowery to witness slugging matches, even to pat and admire the naked brown of the men who fought, is slumming with more sympathy than morals allow. Kildare, living by main strength and the wickedness of his wits in these dark regions, does not seem so mean as do these respectable people who watched his performances with senile delight. He has made a defense of his Bowery at this point which, at least, this class of slummers will not dare to refute. The first two hundred pages is, in fact, a hideous epic founded upon every imaginable stench, cruelty and immorality, all of which he represents as being saner, less contemptible than the impotent wickedness of the better sort, and provided his representations are faithful, he carries the reader far toward accepting his view of the matter.

But the latter part of the volume is narrowed between the life lines of Kildare and his Mamie Rose. Materially they are both in the Bowery regions still, but really they have wandered far afield in that heaven of all lovers. Every man and every woman receives an impulse Godward at such a season; it is the law of things, like the blooming of the first flowers of spring, always white, like their snow mother. And Mamie Rose had that rare thing even in the best of women, the telepathy of goodness. She began

* MY MAMIE ROSE. *By Owen Kildare.* New York: The Baker & Taylor Co. $1.50.

with a wisdom which surpasses the self protecting chastity of the average woman and bound, constrained her pugilist Knight errant with the potent suggestion of what a man really should be. She encompassed him about with the fragrance and beauty of her spirit, like a garden of fairness; she divided him from evil with the superlative temptation to be good. She was the sky above his bewildered head, the firm earth beneath his feet, the singing bird in his branches. Only the very best, bravest women are able to play this *rôle* of the guardian angel to that noblest of all frailties, man. Many a one has tried it only to find herself a span short in wisdom, patience or virtue. But the immortal Mamie Rose counted the cost, examined her new property with the enlightened shrewdness of love, and won out of the investment one brilliant young Irishman, who apparently lives but to praise her and to prove her heavenly minded doctrines in the substance of his own character.

A Study of Ethics

Of making many books on ethics there is no end; but most of them end with the making, and are committed to oblivion unwept, save by the authors of their being. This book,* however, has reason for existing, and scholars will gladly make room for it on their shelves. The author displays great maturity of judgment, and some of his criticism is extremely trenchant and suggestive. His examination of hedonism is a particularly good piece of work. His attitude is so impartial and his tone so moderate as almost to persuade the reader that Epicurus has at last been thoroughly exposed and must confess his errors. That philosopher, however, has survived so many annihilations, and his adherents multiply so persistently, as to make us apprehensive that vigorous protests will be made against Professor Fite's analysis. Some hedonists will object to the definition of pleasure as sensuous; others to being forced into the category of determinists and into the company of Lamarck. However this may be, it is highly interesting to follow the steps by which the author shows how the utilitarian theory implies that man's action is determined by his environment, while the intuitionist, or idealist, holds that man by the exercise of his will makes the environment conform to him. Equally fascinating is the analysis which discloses the relation of hedonism to Lamarckian biology, and the manner in which Weismann's theory throws the responsibility for characters on the original constitution of the organism.

When the author attempts constructive work in stating the principles of idealism, the results are less satisfactory. Unless we know the end for which the universe was made, we have nothing but perfection or self-realization for our ideal. This leads to a kind of sublimated selfishness, quite as odious, practically, as the supposed addiction of hedonists to sensuality. Nor does it require less calculation to measure the demands of self —even if that were all that duty implies —than to estimate degrees of happiness. Many of the author's positions will be vigorously assailed. We have no ground for saying, he asserts, that modern times are happier than the ancient, or for hoping that the world will be any happier hereafter than it is now. Many idealists would certainly deny that society is the only complete organism; they would deny that it is an organism at all. They would also repudiate the extreme statement that the only real personality is society itself; that all individual persons are relative abstractions. But we would advise those who are startled by such propositions not to condemn them too hastily. A careful reading of Professor Fite's argument may convince them that if they start with his premises they will not easily escape from his conclusions, and that if they do not wish to fare with him to the end they would better part with him at the beginning.

* An Introductory Study of Ethics. *By Warner Fite.* New York: Longmans, Green & Co. 1903.

Highways and Byways in South Wales. By A. G. Bradley. Illustrated by F. L. Griggs. New York: The Macmillan Co.

Mr. Bradley has hit the happy mean between the bare gazetteer and the "gossiping guide." There is nothing of the egotistic impertinence of the cicerone

who cracks jokes incessantly and prescribes the appropriate emotions on every turn of the road, but there are just enough pleasing gimpses of the author's personality to dispel the feeling that one is taking a kind of tour *in vacuo*. Mr. Bradley gives us a good deal more than the descriptions, legends, historical associations, etc., which form the staple of the average guide book. He is a trained scholar and observer, and many of his comments throw welcome light upon the characteristics of the Welsh people. He notes, for instance, the type rare in England, but common in Wales, of the village antiquary, who, tho nothing but a country postman or mechanic, will know the pedigree of every family of consequence in the neighborhood. There are again frequent and most interesting references to the linguistic peculiarities of the districts through which Mr. Bradley takes us. The book should increase the number of visitors to South Wales, and that it may do so considerably without overcrowding is clear from the mention of a certain solitude near the Vale of Towry, where "a hermit might bury himself more effectively, and see less of his fellow creatures, than in any part of these islands that it is my privilege to know."

A Handbook of Modern Japan. By Ernest W. Clement. Chicago: A. C. McClurg & Co., $1.40 net.

This book occupies a place intermediate between Griffis and Chamberlain, as it is neither so readable as the former nor so encyclopedic as the latter, and is well adapted by its convenient arrangement and abundance of data for quickly looking up any point in regard to the history and present conditions in Japan, while the list of references, mostly to easily accessible books, appended to each chapter, enable one to follow further the topic if he desires. It is the sort of a book which the hurried editor or writer of a club paper will seize with avidity. There is a good map and, as for the illustrations, the "New Year's Greeting," which we borrow, will speak for them. The author's recommendation that the United States should join with Japan and England in a "triple alliance" for the control of the Pacific, we cannot second.

New Year's Greeting
From "A Handbook of Modern Japan" (Clement). A. C. McClurg & Co.

The Fortunes of Fifi. By Molly Elliott Seawell. Indianapolis: The Bobbs-Merrill Co.

A book that creates the mood by which it is best appreciated. It is a tender, humorous, whimsical love story, daintily

conceived and written with a delicate disregard of the prosaic and the probable. Fifi, the actress-heroine, is a charming little vixen, and the old soldier of Lodi who loves her almost deserves to be thought of along with Jean Valjean,—only Cartouche is a much humbler figure than Hugo's Titan, and his love flowers out into happiness, not tragedy. The story is cast in the times of the first Napoleon and Pope Pius VII, each of whom at times figures in it as a sort of smiling, benevolent genius.

The Virgin Birth of Christ. By Paul Lobstein. Translated into English by Victor Leulliette. Edited, with an Introduction, by the Rev. W. D. Morrison, LL.D. New York: G. P. Putnam's Sons.

The subject of the virgin birth of Jesus does not loom so large in America as in England, because with us the Apostles' Creed is not in such general use. Nevertheless there is much unrest on the subject. Men who have never investigated the New Testament basis of the dogma nevertheless distrust it, because the miracle is so big and the reason commonly given for it so unsatisfactory. Next to the Resurrection it is the miracle of the Bible in which there is greatest popular interest. Professor Lobstein is a vigorous and able opponent of the orthodox view, and maintains that the virgin birth formed no part of the early preaching of the gospel, and is not only untenable, but also harmful. He declares that the two narratives on which the doctrine rests cannot bear the test of historical criticism; that the miraculous birth of Jesus is a myth, the "pastoral epic of Christianity," the outcome of pious devotion to Christ, an effort to explain his commanding excellence and exalted character by the way he came into the world. The doctrine of the virgin birth, he declares, was unknown to Paul; he asserts the non-miraculous conception of Jesus. The author of the Fourth Gospel substituted the Logos doctrine for the idea of a miraculous birth, which had arisen by his time, as it seemed to him preferable. The permanent value of the belief lies in its religious import,—the fact of divine life in Jesus, a fact which some unknown men of the first century supported, he holds, by the stories of the miraculous conception, but which we can believe and experience without applying it as they did to the origin of Christ. Professor Lobstein holds that the dogma arose from misinterpretation of Isaiah 7: 14, the celebrated prophecy of the "virgin." In this he differs from Usener in the article "Nativity" in the "Encyclopedia Biblica," who holds that "the Isaian prophecy could not possibly have given occasion for the shaping of the birth-story," and that we here "enter the circle of pagan ideas." Professor Lobstein, however, makes a strong argument for his view, and his treatment of the whole subject is reverent and suggestive. The book is small and concise, but contains a wealth of material and good bibliographical references. Its publication in English will help on a discussion which, for good or ill, is sure to come.

Poems. By Josephine Daskam. New York Charles Scribner's Sons.

This is a small collection of pleasant verses. The majority of them belong to the lighter varieties of poetry; there are several ballads, a few children's lyrics and a number of songs—all with something of an air about them. But rising from the midst of these, like a rock in a pasture-land, is at least one piece of a genuinely elevated and passionate tone of feeling,—"Motherhood."

"The night throbs on: but let me pray, dear
Lord!
Crush off his name a moment from my mouth.
To thee my eyes would turn, but they go back,
Back to my arm beside me where he lay—
So little, Lord, so little and so warm!
* * * * * *
"Give him to me—he is not happy there!
He had not felt his life: his lovely eyes
Just knew me for his mother, and he died.

"Hast thou an angel there to mother him?
I say he loves me best—if he forgets,
If thou allow it that my child forgets
And runs not out to meet me when I come—

"What are my curses to thee? Thou hast
heard
The curse of Abel's mother, and since then
We have not ceased to threaten at thy throne,
To threat and pray thee that thou hold them
still
In memory of us.
* * * * * *
"Ah, God, my child shall go
Orphaned among the angels! All alone,
So little and alone! He knows not thee,
He only knows his mother—give him back!"

THE index of THE INDEPENDENT for the year 1903 will be ready in a few days and we shall be glad to send it free to any subscriber who will notify us that he wants a copy.

The Complications of an Eastern War

IT is clear that Japan is not bluffing. She is determined to maintain her preeminent influence and control in Korea at the risk of war with Russia. Russia still delays to make any satisfactory answer, or any answer at all, to the Japanese note, and a Japanese fleet is ready to occupy Masampho, if it is not already on the way there. At Tokio war is expected and everything is ready for it. This week may see Japanese forces on Korean territory, and in that case the Japanese and Russian fleets are likely to be in speedy conflict.

Such a war may be a long one. In that case Japan will in the end be beaten by the mere mass of the enemy. Or it may be a short one, but that will depend not on Russia's fighting strength, but on her financial ability to carry on the war, complicated by the disaffection of her oppressed peoples. Let us suppose, as is likely, that in a naval conflict Japan should gain the victory. Let us suppose that victory to be crushing and complete on the sea, as was Japan's victory over the Chinese fleet, or the victories of Dewey and Sampson over the Spanish fleets. It is believed that the Japanese fleet is in fine condition and honestly manned and armed, while this is not true of the Russian fleet. Then the Japanese could speedily throw a force at present overwhelming against any point they might select, while the Russian communications would be about as imperfect and difficult as those of Japan are complete and easy. Let us suppose initial startling Japanese successes, followed by disturbances in the Caucasus, and in the disaffected manufacturing centers; and it would be very difficult for Russia to get the credit for the loans she would need to raise. Where could she go but to France, which is now burdened with more Russian bonds than is safe, and which is growing cold toward the Dual Alliance, from which she gets no advantage. Let us further suppose that through Manchuria the single track of the railroad is raided by Chinese regular or irregular troops and the carriage of soldiers and munitions interrupted, how could the war help breaking down?

But this requires us to consider a very serious complication. France is under treaty obligation to help Russia in the event of her being attacked by two Powers. Is China a Power in the sense of the treaty, or does it refer only to European Powers? It would be the policy of Japan to draw China into the conflict, and China might, if she would, very seriously affect the result. Manchuria is still, in name, Chinese territory. China might, if she would, arm a force under Japanese officers, who would terribly hamper the Russian movements. Would Russia in that case summon the French fleet to her aid, and would France respond? If she did, that would compel Great Britain, under her treaty, to join Japan against Russia's ally, and the naval advantage would again be with Japan. Under the circumstances we may doubt whether Russia would ask the aid of France. To do so would be to confess her inferiority to her yellow foes, and would be terribly galling to her pride and disastrous to her prestige as the strongest military Power in the world. Besides, France would be very loath to consent to aid Russia. Her debt to Russia has already been sufficiently paid, while she finds her chief enemy, Germany, more favored than herself. Accordingly, while a general war is possible, into which the United States even might be drawn—for we are an Eastern Power

with rights in Manchuria—we do not think it probable.

We may further consider what the result of a decisive conflict would be. If it went against Japan she would be compelled to lose her rights in Korea and perhaps be required to give up Formosa to Russia. She would be compelled to delay her aim for the regeneration of China and the forcing back of Russia north of the Amoor. China would completely lose Korea, Manchuria and Mongolia, which would be annexed to the Russian Empire, and Tibet and Persia would soon come under complete Russian influence, and probably Afghanistan also, to the terrible humiliation of Great Britain. If, however, Japan should gain a decisive victory, she would speedily secure an empire in Korea and Russia would be forced back out of Manchuria and be compelled to defer her hopes of Mongolia and other regions until she should recover from the shock and build her railroads; but that would take many years, during which the revolutionary agencies would be putting in their good work for a constitutional Russian Government. Russia would further be compelled to lose her primacy of influence in the Balkans, with a result that cannot be easily foreseen, but which would make for the strengthening, if not the union, of the minor independent states. Of course, Russia's ambition for the possession of Constantinople, and probably Austria's for the possession of Salonika, would have to be indefinitely postponed; not, however, to the advantage of the hold of the Sultan on his oppressed provinces. The defeat of Russia would also give a tremendous impulse to the Socialist or democratic movement in Russia and would immediately weaken or overthrow the power of the reactionary war party, so long in the ascendant. Finland would raise new hopes; the Armenians would demand religious liberty, and the half assimilated provinces would seek to re-establish their independence.

All these anticipations are very uncertain, depending on uncertain issues, but they are the sort of considerations that must give statesmen pause when they propose to go to war.

The Model Arbitration Treaty

NEXT week a notable conference will be held in Washington for the purpose of impressing public opinion with the importance of substituting arbitration for the decisions of war, and especially of establishing a treaty of arbitration with Great Britain. On this subject ex-Secretary Foster spoke to our readers two weeks ago. We may here ask for what such a treaty should provide.

Most arbitration treaties contain a clause reserving the right to go to war over some questions, and it is in drawing this clause that an error is apt to creep in. In a model treaty this clause will be so drawn as to leave no doubt in regard to what questions are reserved for trial by war, and in what questions this right is renounced and trial by the court substituted.

The Anglo-French treaty reserved for trial by war questions affecting the independence, the vital interests, or the national honor of either France or England, and questions affecting the interests of a third Power. This clause is bad, because it is impossible to determine with any certainty what questions affect the vital interests or the honor of a nation.

The treaty between Mexico, Gautemala, Uruguay and other South American nations reserves questions which affect national honor, but it specifies that disputes about boundaries, diplomatic privileges, rights of navigation, validity, construction and enforcement of treaties do not affect national honor. Therefore, this is a better reservation than that in the Anglo-French treaty, but still it is bad, because it leaves a large number of disputes about which it is an open question whether they were reserved or included in the treaty.

During The Hague Conference, autonomy and independence were suggested as the proper reservation, and it is not easy to find a better classification. The reservation in the treaties which Argentina has negotiated with Uruguay, Paraguay and Chile is questions which affect the constitution of either of the parties to the treaty. This is substantially the same as autonomy and inde-

pendence. Tho it would be difficult to improve on either of these, in wording a reservation clause, a great advantage would be gained by providing that all questions should be arbitrated in the first instance, reserving a right to appeal to arms after the decision of the court in questions which affect the independence and autonomy or constitution of either party to the dispute. The right of appeal should exist only for that nation whose independence, autonomy or constitution was questioned. The people of the nation whose independence or autonomy or constitution was threatened would revolt against a decision denying either of these rights, but the people of the threatening nation would hardly be so moved by a decision adverse to their claim. They would abide by the decision. And no questions should be reserved for war except such as move the people so that they could not abide an adverse decision by a court.

Even if questions other than independence, autonomy or the constitution are reserved for trial by war, there should be a trial by the court first in all cases, and a right of appeal to arms after the decision in the designated classes of controversy. This would allow " cooling time," and would enable the people of each nation to hear all the facts on the other side before making the decision to resort to war. But the great advantage would be that making the reservation in this way would place the honor of The Hague Court between every nation and loss of its most precious rights, without taking away its right to protect them by its own forces. With the right of trial by battle reserved in the most precious rights, they are to be preserved only by the forces of the nation. With the right reserved of appeal to arms in such cases after the decision of the court, the honor of The Hague Court as well as the forces of the nation stand guard over its most highly esteemed rights.

Besides, this would follow the course of national governments in their evolution, and it will be wise for nations to do this in the development of their international government.

A clause should be inserted to the effect that no nation could appeal to arms in any case after having allowed decisions of the court to stand in several cases of the same character. This would allow habit or custom to fix the law, and in all governments this has been found wise.

A clause should be inserted to insure the selection of a court to try the question. The method of selecting a court provided for in the treaty of The Hague does not insure that a court will be constituted. Provision could be made in an arbitration treaty for an international jury large enough to meet every requirement, and the procedure for selecting a jury in national courts could be made applicable for completing The Hague Court, after the method provided in the treaty of The Hague should have failed to permit a full court. The number of judges should be specified in the treaty, and not left indefinite. Five or seven would be a good number. Five would be enough for counsel and not enough for confusion, and would probably be better than seven.

As the judicial system and procedure of England and the United States are the same, it is easier for them than for any other nations to adopt a system for arbitrating their disputes satisfactory in substance and in procedure to both nations. If they will adopt a treaty worthy to become a model, it is more than probable that it will be copied substantially by the other nations, and that our system of jurisprudence will thus become universal.

The Theater Fire

Of the horror of the Chicago fire, it is not necessary to speak at length; the whole country, the world, has heard it and has expressed sympathy.

Everything further that needs to be said it summed up in the single word that it was needless. There was want of precaution, want of thought, disobedience of law. Had the law been obeyed there would have been no loss of life. Six hundred young lives would have been saved. Had thought been exercised, as would have been exercised if proper fire drills had been practiced, there would have been no loss of life, for the exit doors would have been opened and the curtain dropped. The asbestos curtain it-

self was a sham. All that held it together burned like the tow it was, and the asbestos fell to pieces with its own weight, or blown to fragments by the blast of hot flame. Had it been let down, as it was not, it could hardly have protected the audience, for it had no strong wire-web base. It is amazing that a great theater could be opened to the public with the ladders of the fire escapes not yet in place. Severe blame belongs to the builders and lessees, and to the city authorities for allowing a building in such a condition to invite crowds of women and children to fill its seats.

We say nothing about the folly and danger of a panic, of the people that fell and trampled over each other in the exits, and died mangled, suffocated and burned. That cannot well be helped; for in extreme danger most people will lose their heads and thereby lose their lives. Only great training and culture in self-control will keep one's head steady in such circumstances, and that we cannot expect of such a company. It is of no special use to preach self-control and thought of others; that is for the pulpit. But it is of use to preach care to those whose business it is to exercise care. Because accidents do not happen every day people forget to exercise care against them; and then, by and by, the accident comes, and may come in such a terrible form as this, all because the doors were not properly opened, or the ladders not there, or the man forgot or failed to drop a real fire proof asbestos curtain.

Well, what shall we do about it? We will shut the stable door after the steed is stolen. We shall be very careful for a week, a month, and then, if certain responsible officials do not keep us up to our duty, we shall slacken a bit, and then a bit more, and then we shall forget, and by and by there will come another terrible accident, all caused by pure carelessness and neglect. It may be another theater, or a railroad crossing, or a tumble-down house; but it will be really not an accident, but a crime, just as this was.

And they tell us a number of people have been arrested and will be tried. Here is the pity of it, that no punishment that can be inflicted can be adequate; it cannot fit the offense or the loss. Families are blotted out, or parents robbed of their children in a moment, by a terrible death, six hundred such deaths, murders, murders of heedlessness, and because it was heedlessness and the ultimate responsibility so far off, no one can be severely punished, as the real ultimate murderers, a syndicate of them, did not hold a bludgeon with intent to kill. We trust that what the law allows will be done; but the chief benefit will be perhaps a year of more care; we hope a more permanent faithfulness of officials in guarding the life of the people.

Back to Tammany

ALTHO New York City went back to the rule of Tammany with the beginning of the year, we do not anticipate that it is returning to all the badness of Van Wyck's administration. Mr. Low's administration was too good, and too cold, for the people, but something of a lesson has been taught, and we must expect that some gain will be permanent. After Mayor Strong's administration things were somewhat better than they had been before; the refluent wave did not sink quite to the previous level. Now, as then, it is the Street Cleaning Department in which the gain will principally be seen.

Doubtless Mayor McClellan means to do well, or thinks he does. We wish that we had clearer evidence that he is strong enough to do well. He has promised us "no step backward." How that will be depends chiefly on what he does with the Police Department, for there is the center of graft and corruption. There is where Tammany, which has put Mr. McClellan in the place of power, if not into real power, intrenches itself.

When the Lexow Committee was investigating the foul alliance of the police force of New York with vice and crime, nine years ago, much interesting testimony was drawn from Captain Schmittberger. The "regular price" paid by pool rooms and gambling houses for protection, he said, was $200 a month. While he was in charge of the Leonard Street Station two pool rooms had paid this price, and he had given a part of it every month, "as was the custom," to his superior officer, Thomas F. McAvoy, the Inspector for that district. This was in 1893. At a later date, and while he

was in charge of another station, he continued, he had given to Inspector McAvoy about $150 a month, this being a share of the money paid there by disorderly houses for protection. Sergeant Taylor testified that he had placed on McAvoy's desk money obtained in the same way, paying to him as he had paid to his predecessor. "I done the same as I always done," he explained. Without demanding an opportunity to testify in reply, or a trial by the police authorities, Inspector McAvoy a few weeks later retired from the service. He has since been a contractor and a politician, having recently become one of Tammany's District Leaders. This same Thomas F. McAvoy was appointed on the 1st inst. to the important office of First Deputy Commissioner of Police. On that day the new Mayor, George B. McClellan, assuming the duties of his office, said:

"The impossible cannot be accomplished. There are some problems in municipal government which are well nigh past solution. Conditions must be faced as they are, and not as we should like to have them; but at least an honest effort can be made to improve them. I promise you that no step backward will be taken in any department."

McAvoy was there, and we presume that these remarks had his approval.

Light on Southern Conditions

THE Scriptural declaration that "we are every one members one of another" has had its confirmation during the past week in the attempts of Northern and Southern experts at New Orleans to come to an understanding about the social and economic conditions. The American Historical Association and the American Economic Association this year for the first time held their joint annual meeting in the South, and arranged programs and discussions with special reference to that section. Nearly two hundred people from various Northern States were in attendance, and they found at New Orleans some of the leaders of thought and practical life in the South. As might be expected, the Southern universities and colleges sent their representatives, and the greater part of the meetings were held in the buildings of Tulane University, which has become one of the two or three leaders in the educational development of the South. To some of the visitors it was a surprise to find so large and so well equipped an institution in the heart of the South, altho its progressive president, Dr. Alderman, has made himself widely known throughout the country.

The Economic Association devoted two of its sessions wholly to the agricultural and industrial problems of the South, and experts on these questions described the culture and conditions of tobacco, sugar, rice and cotton. On the whole these reports were roseate—the richness of soil, abundant rainfall, mild climate and large crops were the staple of the discussions. It was not so clearly brought out that the prosperity of the South depends absolutely on its labor, that the real vital problem is how to increase and improve that labor. No investigator into Southern conditions fails to observe that the bitterness of the whites toward the negroes is in large part due to the irregularity of negro labor. The white man stands with money in his hand, begging his colored neighbors to do his work and take the wage; the negro works five, four or even three days a week, and cannot by any offer that is made be led to help his employer out in times of emergency. On the other hand, the greater part of the South has no other rough labor, and is doomed to poverty and ignorance unless it can elevate the negroes. The truth is that the South, outside a few favored regions like the uplands of the Carolinas, with their cotton mills, the iron regions of Alabama, and the bountiful State of Texas, is still very poor and very backward.

The Historical Association did not go so deeply into peculiar Southern questions for the obvious reason that argument on the political conditions of the South is apt to heat both parties to the discussion. Its program therefore was chiefly given up to such questions as the annexation of Louisiana, in this hundredth year after the cession of that province, and to other Southern and Southwestern historical questions. One session, however, was given to accounts of the study and teaching of history in the South, and it showed a lively interest in history throughout that region. The

acquittal of Professor Bassett, of Trinity College, on the charge of political heresy seemed to find approval among many of the leaders in historical instruction, and the principal complaint was the lack of trained teachers of history and of books in many Southern schools and even colleges.

The South feels an interest in its own history, soberly told, interest in the history of the nation and the world; perhaps the time is approaching when a national historian will arise in the South—a man who can write with New England conscientiousness and with Southern warmth and sympathy. One of the greatest encouragements in the South is the growing willingness of the people to discuss their problems calmly and quietly, for intelligent study of their own industrial and social conditions is the beginning of a manful attempt to improve these conditions.

Dr. Bradford's Pastoral

Dr. A. H. Bradford, Moderator of the Congregational National Council, does not so much magnify as honor his office when he issues his annual pastoral address to the churches of that order. The Council meets once in three years, and its constitution continues the office of Moderator during the interim of meetings. Dr. Bradford follows some good examples in issuing such an annual pastoral, as well as in visiting, by invitation, the chief meetings of the denomination during the three years of his office. His recommendations claim attention.

He first refers to the important action taken the past year, in which he has had a considerable part, to bring together three denominations, the Congregationalists, the United Brethren and the Methodist Protestants, into a single national body, called the General Council of the United Churches. This plan needs full adoption, and Dr. Bradford heartily recommends it to the next National Council. There should be sought a closer acquaintance of the three denominations, with a view to a complete fellowship. Here is a step in advance toward Church Union which may have large consequences, but it needs purposeful fostering.

Dr. Bradford next welcomes a happy change in the conduct of the missionary meetings of the Congregational churches. Hitherto they have been held separately from each other and from the National Council; next October all these societies, except the American Board, in charge of foreign missions, will meet at Des Moines in connection with the meeting of the Council. It is, in Dr. Bradford's view and in ours, unfortunate that the American Board should not come into this agreement; we presume it will later, but on this point there will be difference of opinion. Such a great meeting representing all parts of the country, and lasting over ten days, would produce unity of views and increased enthusiasm. But this will involve a change from a triennial to an annual meeting of the Congregational National Council, and this Dr. Bradford recommends. The Presbyterians hold such annual meetings to their advantage.

This is in the line of Dr. Bradford's next suggestion, that the churches which he represents have had in the past enough preaching of independence and need more co-operation. But that is in the very air. The movement of the denominations is together; and within the denominations union of effort for the Kingdom of God can be promoted without sacrificing liberty. The battle for freedom of thought has been fought and won—pretty well among Congregationalists, and measurably in other Churches. There is now call for a coming together for the religious and social betterment of the country of those who have learned that they can work for common purposes without bothering about their divergent iotas.

But after all, what are churches and denominations for? Not for their own glory and advancement, but for the supreme evangelization of the world, what we call the Kingdom of God. The fact that the three denominations coming into closer affiliation will have over a million members is not important if they do not more fully undertake the mission of making the world

move toward the highest ideal of mutual service in the love of God and man. Will the larger liberty of faith dwarf the spirit of evangelism, which is about all that the Church is worth keeping for? Dr. Bradford believes not. To this service, in these days of mutation, when tremendous immigration is making a composite of our people, he would call the churches he represents. But this is the duty of all religious bodies. Nor do we fear for our country, with all its diverse elements and its new dependencies, which involve enlarged responsibilities. Slav and Teuton and Celt and Anglo-Saxon and Negro and Chinese and Malay, are all of the same mental fiber, and all can be unified into a common civilization under a common Christianity, directed by the spirit which seeks the good of all. What makes that sort of Anglo-Saxon that we boast of, or that Puritan Yankee, is not the physical structure he has inherited from his grandparents of a thousand years ago, but the social heredity which he has acquired since he came into the world a puling infant, taught him, in his home, in his school, in his church. It is to this unity of the higher faith and service that such a pastoral as this calls its churches, and almost equally all the churches of the land.

Colombia and Panama

It was to be expected that General Reyes, representing the Republic of Colombia, should present formal complaint and demands on the United States Government. This he has done, and what he says is not to be wholly waved aside, but should receive respectful attention. First, he asks that our Government restore the status in Panama that existed before the revolution. Of course, he knew that we cannot do that. We did not create the revolution, altho we gave it our sympathy and aid after it was created. Panama will not consent to go back to Colombia, and we have the right to forbid the fighting which would seek to overcome the new nation. General Reyes demands, secondly, that we stand aside and allow Colombia to reduce Panama to submission. He well knew that we would not do that. We will keep the peace along the line of the canal and the railroad, and if that forbids Colombia to subdue the new nation, we do not regret it. Colombia should have thought of that before she provoked Panama to revolt.

But, third, and this is the point and purpose of the entire communication, Colombia asks us to compensate her for the loss of Panama, the amount of damage to be fixed by the Court of The Hague. Certainly we cannot admit that we are responsible for the loss of Panama or owe her any compensation therefor. We claim that our action has been in exact accord with our treaty rights. We started or fomented no revolution. We saw it coming and we looked on benevolently. When it came, without resistance, we acknowledged the new Government. We then told Colombia, as we had told insurgents in previous unsuccessful attempts at revolution, that they must not meddle with our rights of peaceful transit. This was unfortunate for Colombia, to be sure, but not for us or for Panama or for the world. So we can only deny the claim.

But we can also afford to have it adjudicated. Let Colombia file its full claim with us, and ask us to agree to its adjudication by The Hague Tribunal. We ought to allow such reference. If we are right we shall gain the case and stand better with the world, and Colombia herself will be satisfied that we have done her no wrong. She will bear no grudge. If we are wrong, we want it made clear, and we will pay the damages. That is honest and fair, and we, as a strong nation, should seek to take no advantage of a weak one. We shall also in so doing give honor and vogue to the tribunal of The Hague.

In the evidence recently set forth to show that Colombia was repeatedly warned as to the probable effect, on the Isthmus, of a rejection of the Canal treaty at Bogota, we have seen no reference to a letter addressed to President Marroquin in June last, and published at the time by the writer of it, who was no less a person than M. Bunau-Varilla, now Minister of Panama at Washington. "Only two ways," he said to the President of Colombia, would be opened by failure to ratify the treaty then pending:

"Either construction of the Nicaragua Canal

and the absolute loss for Colombia of the incalculable advantages resulting from the construction on her territory of the great artery of universal commerce; or, the construction of the Panama Canal *after the secession and the declaration of the independence of the Isthmus of Panama under protection of the United States.*"

This shows that M. Bunau-Varilla had common sense and some degree of foresight. It does not show that he was conspiring to promote the secession of Panama; for he was urging Colombia, with the most forcible arguments at his command, to accept the pending treaty and thus prevent secession.

Scientific Progress

The world-army of scientific workers moves forward with an even step, and no position of the field can be considered as cut off from the others by national boundaries or annual periods. No greater discoveries have ever been made than are being made now, yet they result, like the building of a coral island, from the infinitesimal labors of so many individuals that it is only when some spectacular point is reached that the attention of the public is attracted. Such an event is the discovery of radium, which, as it gives out heat continuously without external source of supply, offers an apparent violation of the law of the conservation of energy, and which, as it seems to decompose and produce other elements with helium as a final product, overthrows the theory of the immutability of the elements. Many theories of the evolution of the universe through the genesis of the elements from the same simple substance of low atomic weight, like hydrogen, but the reverse process seems now to be more probable, that elements of high atomic weight, like radium, thorium and uranium, have formed the other elements by their decomposition. In so far as this lends any confirmation to the dreams of the alchemists it seems probable that if either be possible, it will be easier to transform gold into silver than the reverse. The newly discovered properties of radio-active substances will probably lead to new cosmical theories on such points as the age of the sun and earth, and may reverse the deadlock which now exists between the geologists, who want more time for evolution of plant and animal forms, and the astronomers and physicists, who say they cannot have it. Into this question will also come the recent work at exceedingly high temperatures by which it has been shown that heat is not in all cases a disintegrating agent, but that certain compounds, such as the carbides, are more stable at high temperatures than at low. To the aid of the biologists in shortening the time necessary for the development of organic forms comes the mutation theory of de Vries, according to which nature does sometimes move by leaps. The revival and increasing confirmation of Mendel's law of heredity has made it possible to discuss evolution quantitatively and to work systematically for the cultivation of species of almost any desired qualities. Physics, chemistry and biology have now joined forces in the study of the cell structure and its fluids, and the study of ionization and osmotic pressure is making somewhat more comprehensible the mysteries of vital processes. Synthetic organic chemistry is becoming bolder in attempts and more practical in its applications. Indigo is now made artificially on a commercial scale from what once was a waste product. Thousands of acres of arable land in India is released from the growth of this plant, and can be devoted to producing food for the starving natives. The constitution of camphor is now known and its commercial production seems practicable. Electrical processes are now preparing cheaply by the thousands of tons substances which a few years ago were the curiosities of the laboratory. The same powerful agent has been substituted during the year for steam for traction purposes in several large cities, and by the use of new forms of motor a speed of 130 miles an hour for passenger cars has been attained on an experimental railroad in Germany. Great progress has been made during the year in the use of air ships, but no new scientific principles have been applied.

Benevolence and Crime

Of the careful statistics of the year gathered by *The Chicago Tribune*, the public properly takes chief interest in

those of benevolences and lynchings, the one representing in a measure the best purposes of our people, and the other their worst impulses. The special gifts and bequests to charity, benevolence, education, hospitals, churches, museums, etc., for the year 1903 amount to $76,934,978, which is almost half a million less than last year. In this amount is not included the amounts given for the general support of churches and missionary societies, but only the special gifts recorded in the press. As might be expected, more than half of this has gone to educational institutions. Mr. Carnegie stands at the head of the list, with nearly $5,600,000 given to libraries, $1,300,000 to colleges, $4,000,000 for pensioning steel workers and $1,000,000 for the Engineers' Union. Next comes Mr. Rockefeller, with over $2,000,000 to the University of Chicago, $6,000,000 to the Rush Medical College and $485,000 to other objects. Some of the largest gifts of the year have come to Columbia University, the chief of which are Joseph Pulitzer's gift of $2,000,000, Elizabeth M. Anderson's $1,000,000, Mrs. F. F. Thompson's of $350,000, and M. H. Dodge's $300,000. Several large bequests for education have gone into the millions.—The lynchings of the last year are 104, being eight more than in 1902, but less than in any previous year for which we have the figures. Of these, 12 occurred in the North (Illinois 3, Montana 3, Wyoming 3), and 92 in the South. Of these, Mississippi has 18, Louisiana 14, Arkansas 13, Georgia 12, Florida and South Carolina 8 each and Texas 7. Of the total number killed, 86 were negroes, 17 whites and 1 a Chinese. Of the alleged crimes, 47 were for murder, 11 for rape and 10 for attempted rape, race prejudice 5, insults to whites 2, mistaken identity 3. It will be seen that the cases of the supposed "usual crime" were about one in five. The reported murders and homicides are 8,976, and the legal executions 123, showing how safe it is to kill a man. The suicides are 8,597, nearly as many as the homicides, and the sad fact is that this crime is on the increase, showing a lowered value set on human life.

President Roosevelt's Southern appointments please as much as they provoke the South, but it depends on which ones they look at. We notice that the Montgomery, Ala., *Evening Times,* a sound Democratic paper, gives a long editorial to the subject in which it declares that no other President since the War has so completely subordinated partisanship to patriotism in these appointments, even when they endangered his own ambitions. It specifies the appointment of two Democrats, one as Circuit Judge and another as District Attorney in Alabama, and refers to a number of similar appointments in Louisiana. It says:

"To show that Mr. Roosevelt has not been seeking his own advantage in doing this alone, we have but to refer to the fact that should Mr. Hanna or any other person come out against him for the Presidency, he will be in danger of losing a good portion of the Southern delegates, or, at least, of having a number of contests on his hands, by reason of the independent and fearless course he has followed in his attempt to secure decent and clean officials in the South."

We can understand the collapse of the Lily White party in Louisiana.

We should have fear that the movement in Louisiana for a division of the school fund between the races on the basis of the respective taxes paid would be successful if it were not for the opposition to it of Dr. Alderman and a few other men of like intelligence. Dr. Alderman's position as President of Tulane University, the leading educational institution in the State, gives him great weight. He publicly identified himself a year ago with the defenders of the public schools, and spoke for them on the same platform with Booker T. Washington. He says well in a late letter to a conference of colored people in Louisiana:

"The highest aim of my life has been, and is, to help in bringing about such a state of affairs that every child in the South, white or black, rich or poor, shall have opportunity to make out of itself the best that can be made. . . . There is but one thing to do in this world for every human being—and that thing is to give him a chance. . . . There is much talk everywhere about the 'Negro Problem,' as it is

called. I read much of this talk in various sources. I am forced to say that much of it seems to me to lack sanity or knowledge."

Bishop McQuaid, of Rochester, writes in reply to a question from *The Outlook* that Catholic young ladies cannot without peril and sin attend any but Catholic colleges, that the teaching in such colleges of history, philosophy and psychology is such as they must not receive, and it is forbidden them to attend chapel exercises in such colleges; and, further, that co-education at their age is perilous and to be avoided. In exposing themselves to such peril they sin, and cannot be absolved in the tribunal of penance without repentance. For these reasons they must attend only Catholic colleges, where they will be correctly instructed in philosophy, history and religion. But this is Bishop McQuaid's dictum, and is not included in the rules of the Third Council of Baltimore. Yet the rule is a useful one to maintain a permanent dead level of uniform thought. What a pity that Professor Bassett was allowed to go to Johns Hopkins for an education instead of being cloistered in a Carolina college.

In our relations with Oriental people it is of the first importance that gentlemen of the different races should meet on terms of kindly fellowship. This is especially important in China, on account of the late difficulties there, and the too frequent annoyance of Europeans in their dealings with the Chinese. A good work in this direction, initiated by the Rev. Gilbert Reid, was interrupted by the Boxer outbreak, and has been lately begun afresh. Mr. Reid has been engaged in a special mission to the higher classes, and is now organizing in Shanghai an International Institute, the object of which is to build a sort of club house where intelligent and wealthy Chinese and foreigners can meet on friendly terms. There will be a large hall for lectures, smaller class rooms, a library and a commercial museum, the building to cost $60,000, of which $20,000 are provided by Chinese men of means, and our Wu Ting-fang was the first subscriber there, and William C. Low is President of the associated New York Committee.

President E. Benjamin Andrews, of the University of Nebraska, declares that he can see no reason why that institution should not accept from Mr. Rockefeller the offer of two-thirds of $100,000 for a religious building, provided the other third is raised; and he expects the condition will be met. President Andrews is right in saying that the gift should be declined if it involved any indorsement of the giver or his ways; but Mr. Rockefeller has never paid the least attention to the sharp criticisms even of professors in the University of Chicago, founded by himself.

The rectors of two ritualistic churches in Philadelphia have taught—or, to use a stronger word, have instructed—their parishioners that they must not eat meat on Fridays; but as Christmas and New Year's came on Friday, they gave them special permission to eat meat on those days. But who gave them the right to impose, or to absolve from, such regulations? It is a piece of utter impertinence to which it is silly to submit, and it is declared that Bishop Whitaker has abetted the assumption.

In the execution of a law which is more stupid than it is vicious, if possible, a number of skilled glass-blowers are to be sent back to England, on the ground that the men had impliedly engaged a job before coming to this country. Such men are just the kind to enrich the country. If they had been Italian navvies, not knowing where to find work, they would have been freely admitted.

The decision of the Supreme Court that Porto Ricans are not aliens is of very great importance. If they are not aliens, it will not be a long step to recognizing that they are citizens. We look forward to the time when they will be citizens of an organized territory.

For an ultra-Jeffersonian American, is not Mr. Bryan doing a great deal of visiting of crowned heads? What is there about courts that attracts him so? The answer is, that he is writing them up for the New York *American*.

The Iroquois Theater Fire

THE cause of the lamentable theater fire in Chicago has not as yet been made entirely clear. One thing, at least, is certain, and that is had the asbestos curtain between the stage and the audience chamber been in proper working order many lives that were snuffed out in a moment might have been saved.

Whether it was a taut wire, of which an aërial performer was to make use, that prevented the curtain from falling, or the strong draft that bellied the curtain so that friction made it impossible to lower it, or the curtain was improperly weighted or the hempen ropes were burned away, or the curtain itself, being but imitation asbestos, was burned, matters not now. Something was wrong, and disaster, panic and a horrifying loss of life were the consequence. The architect of the burned theater says that it was one of the safest he ever planned. If the exit doors were locked, as some of the printed accounts state, the exits might as well not have been in the architect's plans. It would appear as if there had been a conspiracy of catastrophe in the case of the Iroquois Theater.

Death of a Well-Known Insurance Man

JEREMIAH MERVIN ALLEN, for 33 years President of the Hartford Steam Boiler Inspection & Insurance Company, died at his home in Hartford, Conn., after a short illness, on December 29th. Mr. Allen was born in Enfield, Conn., on May 18, 1833. He was a descendant of Samuel Allen, a pioneer, who settled in Cambridge, Mass., in 1632. One of the famous members of this family was also Ethan Allen, the Revolutionary patriot. Another member of this family was the first to engage in the making of microscopes and telescopes in this country. Jeremiah Allen was connected with the American Asylum for Deaf and Dumb Children in the fifties. Then it was that his first tendencies toward fire insurance were manifested, since he was then active in organizing a fire brigade. The company in which young Allen was interested obtained an old fire engine from the city, with which some effective work was done. In 1867 Mr. Allen was elected President of the Hartford Steam Boiler Inspection & Insurance Company. The fortunes of the company were then very low, but under Mr. Allen's management it increased its capital to over two and a half million dollars. Mr. Allen founded and published a magazine called *The Locomotive,* which was devoted to the subject of steam engines. He was the first president of the Hartford Board of Trade, which was organized in 1888. Mr. Allen was widely known in insurance circles and was a member of various scientific and historical societies.

For a number of years Mr. Allen was a lecturer on insurance topics at Cornell University and at the Worcester Polytechnic Institute. He had also been announced as a lecturer in the Yale Insurance Course. Mr. Allen was a warm friend and old subscriber to THE INDEPENDENT. He leaves a widow and two children, Mrs. Elizabeth T. Roberts and William H. Allen, both of Boston.

Insurance Statements.

HARTFORD FIRE INSURANCE COMPANY, OF HARTFORD, CONN.

The oldest insurance company in Hartford is the first to make public its statement of the year's business. The ninety-fourth annual exhibit of the Hartford Fire Insurance Company, of which George L. Chase is President and P. C. Royce, Secretary, shows a gain in assets of over a million dollars, the total assets January 1, 1904, being $14,542,951. Reinsurance reserve has increased $240,701, and is now $8,053,542. The gain in surplus during 1903 has been $756,642, which makes the present surplus to policyholders $5,187,796.

UNITED STATES LIFE INSURANCE COMPANY IN THE CITY OF NEW YORK.

As regularly as the first of January rolls round the United States Life Insurance Company gives to its policyholders and the public a balance sheet showing the results of the previous year's business. The one just issued, the fifty-fourth, shows total assets of $8,795,052, as against $8,634,632 a year ago. The liabilities are $8,207,971; leaving a net surplus of $587,081. During 1903, payments amounting to $1,060,955 have been made to policyholders for dividends, death claims and matured endowments. The President of the United States Life Insurance Company is John P. Munn, M.D.

Financial

Financial Items

For the six months ending with December, the first half of the fiscal year, the receipts of the Government exceeded expenditures by $8,433,000.

....We offer our sincere apology to the National Park Bank, of New York, for the typographical errors in their page advertisement printed in our Christmas Number. The advertisement is correctly printed this week.

....It is estimated by the Director of the Mint that the gold output of the United States in 1903 was $74,425,000, against $80,000,000 in 1902. A decrease from $28,468,000 to $22,000,000 in Colorado is attributed to the miners' strikes.

....The decline in the market value of the stocks of leading industrial corporations from the highest prices of the last three years to the recent low prices has been from $4,090,047,450 to about $2,250,000,000, or 45 per cent.

....L. F. Loree has given up the office of President of the Baltimore & Ohio Railroad Company to become President of the Rock Island system, at a salary exceeding that of any other railway officer in the country and reported to be not much less than $100,000.

....The annual statement of the Brooklyn Trust Company, of which Theodore F. Miller is President, shows total resources of $16,741,409. The capital stock is $1,000,000, and the undivided profits $1,903,621. Deposits aggregate $13,738,416.

....The life of the underwriting syndicate for the International Mercantile Marine Company (Atlantic Steamship Trust), which was to expire on January 1st, has been extended until March, 1905, owing to the lack of a favorable market for the securities.

....No preventive has yet been found for the boll weevil pest in the cotton fields. Texas planters have lost $15,000,000 this season by the work of this insect, and the Department of Agriculture fears that the entire cotton belt will soon be affected by it.

....According to the Government's final estimate, the corn crop was 2,244,176,000 bushels (against 2,523,000,000 in 1902, and 1,522,000,000 in 1901), and the wheat crop amounted to 637,821,000 bushels, against 670,000,000 in the preceding year. The value of the principal farm crops, including hay, potatoes and tobacco, was $2,534,000,000. In 1902 it was $2,557,000,000.

....Dividends announced:

Buffalo & Susquehanna R.R., quarterly, 1¼ per cent., payable January 2d.
N. Y. County Nat'l Bank, semi-annual, 50 per cent., payable January 2d.
New Amsterdam Nat'l Bank, quarterly, 8 per cent., payable January 2d.

(*Continued from page* 55.)

NEW YORK LIFE INSURANCE COMPANY.

It would be hard to estimate the number of those who are interested in the annual balance sheet of this colossal institution, for there are to be found in every civilized quarter of the globe those whose future welfare depends in large measure upon the stability and prosperity of the New York Life Insurance Company. Some idea of the magnitude and growth of the company's business can be obtained from a comparison of the statement just issued with the one published a year ago. For instance, January 1, 1903, the total assets were $322,840,900, while now they are $352,652,047, an increase of nearly thirty million dollars. The principal item of assets is represented by Government, State, city, county and other bonds (the company has not a dollar invested in stocks of any description) listed at their cost value of $247,994,383. The market value of these bonds on December 31st was $250,140,939, but this excess of over two million dollars is not included in the assets. The reserve required by the New York Insurance Department, with all other liabilities on policies, annuities, endowments, etc., amounts to $305,547,001, which leaves a surplus of $47,105,046. The total cash income in 1903 was $88,269,531, as against $79,108,401 in 1902, a gain of more than nine million dollars. During the year 171,118 new policies were issued, representing an insurance of $326,658,236; this was a gain for 1903 of 15,678 policies, or $23,860,007 of new business. It is a noteworthy fact that this new business was secured at a decreased expense rate. The total amount of insurance in force is $1,745,212,899, represented by 812,711 policies, an increase during the year of 108,144 policies and $191,584,873. We heartily congratulate President John A. McCall on the magnificent showing made by the New York Life Insurance Company for the year just ended. None the less heartily do we extend our congratulations to the hundreds of thousands of policyholders upon the wise and successful management of the company's affairs by President McCall and the Finance Committee, composed of such well-known business men as George W. Perkins, John Claflin, Edmund D. Randolph, Charles S. Fairchild, Woodbury Langdon, William R. Grace, George Austin Morrison.

The Independent

VOL. LVI NEW YORK, THURSDAY, JANUARY 14, 1904 NO. 2876

Survey of the World

Politics and National Topics

At the recent dinner in honor of the new Mayor of New York there were interesting expressions of opinion by prominent Democrats. Mr. Cleveland could not attend, but he sent a letter in which he said:

"The impressive thought cannot be evaded that the manner in which the Democracy of this city shall meet its municipal responsibilities will in a large degree determine the extent to which our fellow countrymen, in every part of the land, will be willing to trust the Democracy of the nation in broader fields of governmental rule."

Judge Parker, in a brief note, pointed to the new Mayor's opportunity and commended his public utterances. Mr. Bourke Cockran, presiding, denounced corruption and the protective tariff. Democrats believed, he remarked, that the moral law should be obeyed in the government of municipalities. Mr. Richard Olney, at the end of a long address, declared that Mr. Cleveland was "the man of all men most capable of giving us the kind of administration we want—the man with the proven courage of his convictions, who never yet turned his back upon the approach of a public duty, and is too old to learn now." Mr. Olney had opposed the President's Panama policy, and had said that the country, surfeited with sensations and spectacles, needed a rest, in order that it might, among other things, "assimilate its undigested dependencies." Ex-Senator Hill bitterly attacked Mr. Roosevelt in a long speech of severe partisan criticism. A few days later the Democratic Committee of Massachusetts by resolution called for the nomiantion of Mr. Olney.—At a dinner in Washington, where he was the guest of honor, Senator Thomas C. Platt spoke at length of the political prospect, saying:

"The signs of the approach of a great political year are already numerous, and some of them indicate the return of the Democratic party to a sane and dangerous condition. We are not apt to have in the election next fall all of the advantages we enjoyed in the last two national campaigns. We must prepare ourselves for another sort of battle."

But, he continued, the party was assured of courageous, intelligent and popular leadership, business prosperity had not been interrupted, and Mr. Roosevelt's administration had been strong and wise. As for the Democratic party, the spirit of socialism was rampant in it, and nine-tenths of its members were "tariff-smashers and currency-debasers." A Democratic President must yield to the spirit of his party, said the Senator, or "be the rock on which his party splits in pieces."—Mr. Bryan returned from Europe on the 9th, and was heartily welcomed by a great many Democrats. He had been treated everywhere, he said, with the greatest possible courtesy, and was confident that the attitude of all European nations toward the United States was one of the most friendly and sincere interest. "Instead of having the biggest navy in the world," said he, "I would make our Government the best in the world." Instead of striving to make our flag float everywhere, he would seek to have it regarded everywhere as standing for justice and morality.—The press reports that Justice Harlan, of the Supreme Court, said on the 8th, in a lecture on the Constitution: "Let us hope that this great instrument, which has served so well, will weather the storms which

the ambitions of certain men are creating in an effort to make this country a world power."—Major-General Chaffee has been nominated to be Lieutenant.-General, suceeding General Young, who is to be retired. Promotions and retirements cause many other changes at the same time. Among those nominated to the rank of Brigadier-General is Albert L. Mills, now a Captain (for some years past the Superintendent at West Point), who is thus advanced over the heads of about 700 majors, lieutenant-colonels, or colonels, who precede him in the army list. The order retiring Lieutenant-General Young contains about 600 words of the highest praise. The difference between this order and the very curt one announcing the retirement of Lieutenant-General Miles excites comment in the press.—The Senate Committee that has been taking testimony concerning the promotion of General Wood has made a favorable report by a vote of 7 to 2.—Our new treaty with China, the most important sections of which relate to the opening of two ports in Manchuria and the abolition of internal transit taxes, has been ratified at Peking.—By unanimous vote of the Cabinet it has been ordered that the work day in the Executive Departments shall begin at 9 A.M. and continue until 4:30 P.M., with half an hour for lunch. Heretofore the day has ended at 4 P.M., altho the law calls for seven hours. Owing to requests from the Departments for additional clerks this action has been taken. It is said that about 100,000 employees, in and out of Washington, are affected by it.

The Panama Question

Mississippi's Legislature follows that of Louisiana in instructing the State's Senators to vote for the ratification of the new Canal Treaty. It is now reported that at least 15 Democratic Senators will vote in the affirmative.—Colombia has formally applied to a French court, the First Tribunal of the Seine, for an injunction to restrain the Panama Canal Company from transferring its rights and property to any Government, pointing to that clause in the concession which forbids such transfer under penalty of forfeiture, and asserting that the company has not obtained the consent of Colombia so to dispose of its granted rights. This application followed the recent meeting of the company, when an agent representing Colombia's 50,000 shares was excluded. It is reported that our courts will be asked to prevent the payment of $40,000,000 to the company, upon the allegation that there is no warrant of law for it because the company has no lawful rights, or none that can lawfully be sold; also, that an attempt may be made, upon similar allegations, to prevent the payment of $10,000,000 to Panama.—In the Senate the President's explanatory message of the 4th inst. has been the subject of debate. Mr. Stewart advised the Democrats to "get into the band wagon" without delay, assuring them that the people cared nothing about "the little band of robbers at Bogota," and were going to build the canal. Mr. Lodge spoke for two hours and a half in defense of the President's course, suggesting a parallel with the action of Jefferson, who thought he was transcending his constitutional power in making the Louisiana Purchase, but went on boldly and reared for himself a great and enduring monument. In the present case, however, there was no doubt as to the President's Constitutional power. Mr. Lodge expressed regret that there should be a partisan division as to this question, but remarked that the Republicans could ask for no better campaign issue. Referring to the speeches at the recent Democratic dinner in New York, he added that nothing could be better for the Republicans than to have the Democrats nominate Mr. Cleveland upon a policy of sustaining Colombia and opposing the construction of a canal at Panama by the United States. Mr. Morgan spoke two or three times, sharply attacking the President, asserting that the revolution was assisted by United States officers, that Colombia might rightfully regard our recognition of Panama as an act of war, and that the Canal Company was a band of robbers. Mr. Gorman introduced a long resolution, calling upon the President for a full official record of all instances of the action of our Government on the Isthmus, under the treaty of 1846, with the warrant for the same, the attitude of

Colombia in each case, our Government's interpretation of the treaty as bearing upon uninvited military intervention, etc.—The confirmation of the nomination of Minister Buchanan is still delayed, the Democrats claiming that the President should not have made the appointment because the office had not been created by Congress. On the other hand, it was said that Mr. Buchanan was sent to Panama merely as an envoy or diplomatic agent of the President.—In response to General Reyes's inquiries in December as to the attitude of this country if Colombian troops should invade the Isthmus, Secretary Hay referred to the recognition of the independence of Panama by many Governments, and to the terms of the new treaty, saying that there were "already inchoate rights and duties created by it which place the responsibility of preserving peace and order on the Isthmus in the hands of the Government of the United States and of Panama, even if such responsibilities were not imposed by the historical events of the last fifty years." Therefore our Government would regard such invasion "with the gravest concern," and "for the broader reason that in the opinion of the President the time has come, in the interest of universal commerce and civilization, to close the chapter of sanguinary and ruinous civil war in Panama." Our Government's reply to the final inquiries and demands of General Reyes—which involved a submission of the controversy to The Hague Court—has not been given to the public, but is said to contain a refusal to reopen the question in any way. General Reyes has reported to President Marroquin the failure of his mission, giving no advice as to the course which Colombia should now pursue.

Colombia and the Isthmus

At the end of last week it was expected at Colon that Colombian troops would soon attempt to invade the Isthmus. Soldiers from the interior of Colombia had for some time been gathering at Savanilla and Cartagena and were going by water to Titumari, a point near the boundary where the "Atlanta" found 500 encamped on December 15th. Within the limits of the Republic there were 1,200 American marines, but at last accounts nearly all of them were at points on the line of the railway. The Indians of the Darien district are friendly to the Republic, having been furnished with guns and ammunition by the Junta. Those of San Blas appear to be hostile. Their chief, Inanaquina, who recently was taken to Cartagena on a Colombian gunboat, and whom the Colombians made a Colonel in their army, has returned to his tribe in the glory of a new uniform, and his people have repelled all advances made by Americans scouting along the Atlantic Coast.—When the "Olympia" entered the harbor of Cartagena—from which she carried Minister Beaupré to Colon—she raised the Colombian flag and fired a salute of 21 guns. This salute was returned, and the Colombian battery also saluted Admiral Coghlan when he sought his ship after a brief visit to the Governor of Bolivar.—Nineteen Colombian Senators have sent a telegram of thanks to Senator Gorman, denouncing "conquest veiled under the name of imperialism."—Overtures from other Colombian States are said to have been rejected by the Panama Junta, who express sympathy, but prefer that the Isthmus shall be free from such alliances. —There has been published a long and remarkable letter addressed to the Colombian Minister of War by General Triana, the military commander in Cauca, who complains of corruption and blunders at Bogota, says that the people of Cauca have been treated like a horde of savages, and asserts that they are almost unanimous in favor of separation. The union can be preserved, he asserts, only by substituting federation for the present centralized system; and he suggests that a national convention be held in order that an agreement may be reached.

The Driggs and Dietrich Cases

Edmund H. Driggs, member of the House from 1897 to 1901, and one of the 31 persons indicted for complicity in the postal service frauds, was convicted in the Federal Circuit Court, at Brooklyn, on the 7th, the jury's verdict being qualified by a recommendation for mercy. It was conceded that Driggs received from the Brandt-Dent

Company $12,500 for selling to the Post Office Department 250 automatic cash registers at $150 each. Representatives of the company testified that it received only $50 of this price. Driggs took $50; the disposition of the remaining $50 was not explained. The contract was obtained from George W. Beavers, Superintendent of Salaries and Allowances (now awaiting trial on several indictments), and was issued by First Assistant Perry S. Heath, Beavers's superior officer. Driggs, on the witness stand, denied that he had paid money to any officer of the Department, but under searching cross-examination he admitted that after procuring this contract he had given to Beavers $2,800. This, he said, was to be Beavers's contribution to the Republican campaign fund, and he had paid it because Beavers was his friend. His admission caused some surprise, because Driggs is a Democrat and has been prominent in his party. He insisted that the checks were drawn to the order of the Republican Committee. There was evidence that when the checks (which have been destroyed) came back some of them bore the indorsemeont of Beavers. Two Presiding Elders of the Methodist Church and other persons testified in behalf of Driggs's high character and standing. His defense, that he was not a member of Congress when he received the money (because, altho he had been re-elected, he had not qualified by taking the oath), had no weight with the court. The full penalty is $10,000 and two years in prison; the convicted man is also forever debarred from holding office under the Government of the United States. Sentence was deferred. Judge Thomas said he would not make imprisonment a part of it if the law did not require him to do so. It is expected that the imprisonment will be for not more than one day. —At Omaha, on the 8th, United States Senator Charles S. Dietrich, of Nebraska, escaped trial on a charge of bribery, because his counsel's demurrer to the indictment was sustained by Judge Van Devanter, of the Federal Circuit Court. Several indictments against the Senator have been found; at earlier dates all except this one were quashed for various technical defects. This asserted that the Senator had received from Jacob Fisher $1,300 for the appointment of the latter as Postmaster at Hastings. Rent and the value of furniture were involved. The Senator's counsel claimed that the law did not apply because the transaction took place in the interval between his election and the date when he was sworn in at Washington. The court accepted this plea, holding that during this interval Senator Dietrich was not a "member of Congress." Driggs was indicted under another statute, which holds a member responsible "after his election." With the Senator, Postmaster Fisher was discharged. As Senator Dietrich had proclaimed his determination to take no advantage of technicalities, his counsel explained that advantage of them was taken because a thorough trial would not have been permitted by the court, which, he thinks, would have raised the same point.—In Senate and House the Democrats have been calling for an investigation of the postal frauds by special committee, alleging that only half the story has been told. Republicans have insisted upon having the resolutions referred to the regular committees, holding that the Government's inquiry has been thorough and that Congressional investigation might prevent a successful prosecution of the guilty. Senator Clay declared that the Bristow report demonstrated "the absolute guilt of Perry S. Heath," and complained because he was not indicted.—Michael W. Louis, who was attacked in that report and has been dismissed from the office of Superintendent of Supplies, has sued the Postmaster-General and Fourth Assistant Bristow for libel, asking damages of $50,000. He will also sue the Washington newspapers.

Cuba and Porto Rico

The Cuban Congress having persisted in passing, by a large majority, a bill for a State Lottery, President Palma has vetoed this measure. In his message he says that the proposed lottery would be a debasing and demoralizing device, inducing idleness and killing ambition. Pointing out that the Cuban Lottery of the past ended when Spain ceased to control the island, he remarks that the Con-

gress of the Republic should strive to educate the people in a regard for higher standards of morality and patriotism, instead of lower ones. This excites anger, especially in the Senate, but it is predicted that the veto will not be set aside by a two-thirds majority.—The President has also vetoed a bill providing special procedure for members of Congress accused of criminal offenses, requiring that they should be tried only by the Supreme Court. This measure was retroactive and is said to have been designed for the advantage of Representative Corona, who is charged with shooting a man in Santiago. The veto was effective and was supported by public opinion.—A bill recently passed, modifying the terms of the act which authorized a loan of $35,000,000, empowers the President to pledge the customs receipts as security, and creates special permanent taxes upon the manufacture, sale and consumption of certain articles, to guarantee the sinking fund and interest. It is thought that under these conditions the loan can be negotiated in New York.—The Supreme Court at Washington has decided by unanimous vote that citizens of Porto Rico are not aliens within the meaning of our immigration laws, because they owe no allegiance to a foreign power, but are governed by the Congress and executive officers of the United States. This was the case in which the immigration officers refused to admit Isabella Gonzales, a Porto Rican, on the ground that she would probably become a public charge. The court declined to pass upon the questions whether cession naturalized the people of the island and whether a citizen of Porto Rico is of necessity a citizen of the United States.

Latin American Affairs

General Jimenes is still engaged in wresting the Presidency from General Morales, whom he helped to the provisional Presidency a few weeks ago after the overthrow of President Wos y Gil. There has been considerable desultory skirmishing and fighting throughout the whole republic, and early this week the insurgents were near enough to the capital city, San Domingo, to shoot over the barricades, so that one shell struck the City Hall and another exploded in front of the United States Legation. At present, if one may judge from contradictory rumors, the insurgents are likely to be victorious. Our State Department so far refuses to recognize the Morales Government.—The treaty with Brazil has just been ratified by the Bolivian Congress, whereby the famous Acre dispute will be settled. Acre, it will be remembered, is a vast virgin and unexplored region at the headwaters of the Amazon River. It was claimed by both Brazil and Bolivia when its vast resources were discovered a year or so ago. The treaty provides among other things that Brazil shall pay Bolivia $10,000,000 indemnity, and that Brazil shall have a small strip of the territory. A railroad shall also be built for the commerce of both republics, and all inhabitants and produce of Acre are to have navigation without imposts of the Amazon River and the Bolivian affluents.

The New Course in Norway

At the recent Parliamentary elections in Norway the Liberal Ministry Blehr, the policy of which had aroused universal opposition, suffered a crushing defeat, and the Parliamentary majority changed from the left to the right, and as a consequence a change in the Cabinet had to follow. In the old Storthing, which numbered 114 members, there were 78 adherents of the left or Government party, and 36 Conservatives; in the new Parliament, with 117 members, are found 64 Conservatives and moderate Liberals, and 48 Radical Liberals, and 5 of the workingman's and Socialistic party. In the newly organized ministry only one of the old has been continued, altho it was announced that Blehr would defy public sentiment and continue in office. This one member who has retained office is Siguard Ibsen, who is Minister of the Stokholm State Council. The new Cabinet by the left, under the leadership of Björnson, had contributed materially to the fall of the Blehr rule. The new Finance Minister, Kildat, was at one time a member of the Sverdrup Ministry. Pastor Hange was intrusted with the portfolio for edu-

cation and the Church. In the Cabinet Professor Hagerup, the Conservative agrarian leader and chairman, is recognized as the head of the party now in power, which prominence is the natural result of the fact that he more than any other person caused the downfall of the Liberals. Hagerup is an interesting character. He is about fifty years of age, and is professor of jurisprudence in the University of Stockholm, and has been a popular defender of Conservative principles for many years. The new Ministry proposed to adopt a moderately progressive policy, but to avoid all radical or revolutionary measures. It is significant that not only a number of Liberal leaders, but even some of the Socialistic men, have shown their preferences for Hagerup, among the friends being also Björnstjerne Björnson, whose adherence is proof enough that the advent of the Conservatives does not signify a reaction. It is generally expected that the result of this Parliamentary election will lead to the organization of a new national Liberal party, and this seems to be the chief political problem of the future in Norway.

The Crisis in the Far East

But very little is really known at the time of writing about the actual status of the negotiations which are in progress and the probability of hostilities. Peace news comes from France, war news comes from England, no news from Japan and mere newspaper discussions from Russia. The Russian reply has been received by Japan and considered in a Council of the Elder Statesmen. Altho the contents of this note are not definitely known, it is supposed that Russia has made important concessions and has recognized the interests of Japan in Korea, and is willing to give her a free hand in the southern part of that country, while the northern third is to be maintained as a neutral zone, and Japan is to give up all claims of a right to interfere with Russian affairs in Manchuria. This proposal grants to Japan what she has been willing to fight for, a foot-hold on the continent, but only on condition of submitting to the Russian occupation of Manchuria and the probability that the northern half of Korea would also come under Russian control. Mr. Uchida, the Japanese Minister at Peking, has hitherto kept China from formally consenting to Russian encroachments by the assurance that Japan would support her in resisting them. It is not known whether in the reply of Japan to these Russian proposals they are rejected absolutely or whether they are accepted at a basis for further negotiations. Both France and Germany are supposed to be exerting all their influence on their respective allies to induce them to preserve peace, and it is semi-officially announced by Germany that the Triple Alliance will in case of war maintain a strict neutrality. M. Daeschner, First Secretary of the French Embassy in London, has stated that the relations between France and England are so friendly that nothing that could happen in the Far East would disturb them, and that even if Korea and China joined Japan they would not be considered as Powers in the meaning of the Franco-Russian treaty so as to require the interference of France.

Conditions in China

Altho the Grand Council has advised the throne to adopt the policy of neutrality, perhaps in consequence of Russian threats to occupy Peking in case she should assist Japan, it will be difficult to prevent the people of Manchuria, who are reported to bitterly hate the Russians, from harassing the railroad and irregular warfare. Manchuria is even now invested with mounted brigands and river pirates, who are well armed and do not hesitate to attack Russian soldiers.—The Emperor of China has ratified the commercial treaty with the United States, which opens to us and to the world the two Manchurian ports of Mukden, the capital of the province, and An-Tung on the Yalu River. Since Japan is equally with other nations entitled by this treaty to commercial rights in Manchuria, it may play an important part in the present crisis. There will be no immediate changes effected by this treaty, since the time limit for the exchange of ratifications is next Octo-

ber, and after that legislation will be needed to carry it into effect. The United States Government is determined to preserve a strict neutrality, and has given force to its profession by ordering the American fleet in Japanese waters to Subig Bay, near Manila.

Preparations for War

In Japan an emergency ordinance empowers the Government to draw upon the Chinese war indemnity and all funds in special accounts, and to raise money by short loans and issuing exchequer bonds. This insures a war credit of over 100,000,000 yen. The Government was also authorized to assume the management of the Fusan-Seoul Railway, which connects the port nearest Japan with the Korean capital; the owners of the road being guaranteed 6 per cent. dividends.—The Japanese cruisers "Niasin" and "Kasaga" left Genoa on Saturday, presumably for the East by the Suez Canal.—The Russian fleet in the Mediterranean have been detained by a severe gale.—It is stated that transport preparations have been completed by which Japan could land 35,000 troops in two divisions at Fusan and Masanpho in Southern Korea immediately on the outbreak of war.—The Russian forces are so stationed as to protect the railroad and prevent the breaking of communications between the two ports of Vladivostock and Port Arthur. Mukden is reoccupied, and Sin-Min-Tun, the first station to the south of it, is being fortified.—Vladivostock and Port Arthur are now so well fortified and provisioned as to be as able to stand as hard a siege as Sevastopol in the Crimean war.

South African Labor Questions

The question of the importation of Chinese to supply the demand for unskilled labor is being energetically debated in the Transvaal, and public meetings are being held throughout the country under the auspices of either the Labor Importation Association, which favors Chinese importation, or the African Labor League. Sir A. Danby, the Governor-General, has been visited by delegations from both parties. The Labor League ask for a referendum in the hope of now delaying and ultimately defeating the proposition. The advocates of the proposed measure insist that it is a purely business question and should not be dragged into politics; that the majority of the public meetings have declared in favor of Chinese labor, and therefore a referendum is unnecessary and would only delay the action which is now imperatively needed. In case it is made a political question the Boer vote would hold the balance of power between the opposing factions of the British. In the meantime on account of the unsettled conditions industry is at a standstill, and in Cape Town alone there are a thousand artisans out of work.—British trade in South Africa is suffering from German and American competitors, who have much the more energetic commercial travelers, and take more pains in the details of packing and transportation. Seven steamships were loaded in Brooklyn with machinery and miscellaneous goods for South African markets recently.

Elections in Australia

It was prophesied by those opposed to the recent legislation of a socialistic tendency that the parliamentary elections would check the power of the Labor party, which, as they thought, was responsible for the decreasing population in five out of the six States of Australia, and by governmental "interference" with freedom of contract between employer and employee, and monopolizing many branches of business formerly in private hands, was driving away capital and bringing ruin on the country. The election shows, on the contrary, that the people gave a very strong vote of confidence to the leaders in radical measures in the interests of labor, and that there is to be no reversal of the present tendency. In the Lower House the Labor party got 22 out of 75 members, a gain of six, while in the Senate they doubled their representation, which is now nearly half the membership. Both men and women vote, and the Senators, half of whom retired this year, are elected by popular suffrage, tho by States as in this country. Victoria, the richest and most populous of the States, elected

all Labor Senators. This is the more significant because in this State the Labor party was most strongly socialistic, and also because here it was thought that the labor cause had received a severe blow when the Government suppressed the strike on the State railroads. The result of the election is expected to be the extension of the compulsory arbitration act to all industries; the suppression of Lascar and Kanaka labor; the speedy choice of a capital for the Commonwealth, and opposition to any change in the tariff in the interests of imperialism as desired by Mr. Chamberlain. These problems were discussed in our last issue by Sir Frederick Holder, Speaker of the House.—The wheat crop this year is the largest ever known and is estimated at 76,000,000 bushels, while the highest previous yield was 48,000,000.

Abyssinia Two Americans have recently visited the Court of Menelik II in the interests of American commerce with Abyssinia. One of them, William N. Ellis, is a negro, and the agent of an American corporation which desires a railroad franchise. He reports that the opportunity for the increase of our trade in East Africa is encouraging, especially in cotton goods, of which already some $3,000,000 to $4,000,000 worth of American manufacture is imported through France and England. The coal and iron deposits are rich, but unworked. He was favorably received by the Emperor, who expressed admiration for Lincoln and Roosevelt, and he was lodged in the palace at Addis Abeba. Mr. Robert P. Skinner, the United States Consul-General at Marseilles, who later visited Menelik to arrange with him a commercial treaty, and to extend to him an invitation to participate in the Louisiana Purchase Exposition, was escorted to the capital by several thousand Ethiopian soldiers and presented with two lions and a pair of elephant tusks to convey to President Roosevelt, and all his party received decorations. The favor shown now to Americans is, however, no more than has been given in turn to similar missions from Italy, France, Russia and Germany. An Italian expedition is now engaged in prospecting for minerals in the Tigre district, where seven years ago they were driven out with such great losses. The French are becoming alarmed at the growing influence of the English in this field, and the Chambers are asked to double the subsidy granted to the Ethiopian Railway from the French port Djibuti to Harrar, the city next in importance to the capital. France has already spent $5,000,000 on this railroad, which has had little traffic, except the transport of its own materials. It is complained that the English are using the reserve funds of the Egyptian debt in construction work on the Cape to Cairo Railroad south of Egypt.—In Somaliland the British surprised and defeated the mad Mullah with 2,000 dervishes after three hours' fighting. The British forces numbered 700, and lost only two men.

Somaliland The *rapprochement* between England and Italy evidently means more than an exchange of royal visits and the courteous phrases of diplomats, for in Somaliland, which the English regard as essential to their control of the Red Sea and the route to India, and in which the Italians see a chance to recover their lost power in East Africa, the two nations are acting together in this campaign. Orders are issued simultaneously to the commanding officers of Italian and British ships, and officers of either nationality are carried on the ships of the other. The rebellion began with the killing of Lieutenant Grabau at Durbo on the coast of Italian Somaliland, who, on the refusal of the headman of the village to hoist the Italian flag, opened fire and in the return volley was shot. The British cruiser "Mohawk" called immediately at Durbo to inquire into the affair, and, on the refusal of the Sultan to give satisfactory explanations, Commander Gaunt with 60 marines attacked the force of about ten times their number of Somalis and were forced to withdraw after the wounding of Commander Gaunt. The Italian dispatch vessel "Galileo" next visited Durbo and demolished by bombardment what little was left of the town by the "Mohawk." The brother of the Sultan was taken prisoner. The Italian cruiser "Cristoforo Colombo" has been dispatched to the coast.

The Isthmian Question

BY THOMAS D. HERRAN

[Dr. Herran is the regular diplomatic representative of the United States of Colombia in Washington. He has no connection with the mission of General Reyes, who has been given the title of Envoy Extraordinary to conduct the negotiations pending between the two Governments. Dr. Herran is an authority on the industries, commerce and natural resources of the northern section of South America and has made a study of the possible development of this section of the continent. For several years he was the chief representative of the United States in Colombia.—EDITOR.]

THE discussion over the acquisition of the Panama Canal route and the construction of the waterway may have caused the position which the United States of Colombia occupies toward this section of the isthmus to be misunderstood. The negotiations which are being conducted between General Reyes as Envoy of the Colombian Government and the United States have little bearing upon the canal itself, but refer especially to the portion of the isthmus which Colombia claims as one of its States. It has never relinquished that claim. Consequently the statements relative to invasion of this territory by its troops are without foundation, for the reason that there can be no invasion except of a foreign country. While the people of the Republic consider they have the right to station their soldiers wherever it is deemed necessary for the public interests in their own country, I feel safe in contradicting the reports that any troops, whatever, have been sent from other portions of Colombia into Panama since the beginning of the present negotiations. I am sufficiently aware of the confidence which the people have in General Reyes and his influence in Colombia to make this statement, for he gave positive instructions to carry out no movement of this kind when he left South America. From his position he is able to absolutely control the movements of the army. Neither would there be a possibility of any State moving troops contrary to his orders, for no revolutionary or other disturbance exists in the Republic. From a diplomatic standpoint, it would be very unwise to take such a step since it could only cause the United States Government to distrust the Colombian overtures, and would be both dishonest and discreditable to our Republic.

As a matter of fact, the building of the canal at present is of very little interest to Colombia, either one way or the other, since it is so isolated from the principal states. In the Magdalena, which might be called the Mississippi of South America, and its tributaries, the Republic has a network of waterways which are sufficiently deep for transportation. The Magdalena resembles the Mississippi, not only in size, but in the shifting of its channel. The principal impediment to traffic consists of the bars which are formed, but the water is of sufficient depth to allow steamers to ply far up the river, while the lower portion is navigable for ocean vessels. When the canal is completed the only use which could be made of it by Colombia would be to send a few articles from the eastern coast to the western coast, for the principal foreign commerce of Colombia is with Europe. It is one of the South American countries in which Europeans have obtained a strong foothold. Not only the Germans and French have located on the coast and in the interior, but the English have taken advantage of the situation, and their interests are more extensive than even those of the Continental nations. They have specially realized the opportunities for traffic by means of the numerous streams in the interior, but also maintain trans-Atlantic service. It is an interesting fact that while no less than five lines of steamships ply between Colombia and Great Britain alone, there is not a single line in operation between the United States and its principal seaports, and practically all of the American exports are carried to the country in vessels flying the German flag. The Republic presents an extensive and profitable field for American trade, if it is properly cultivated, but the people of the

United States make the same mistake here that they have made in many other countries in their efforts to secure business. Frequently your exporters send men down there who cannot speak a word of the Spanish or French language, and with no letters of introduction or other means of getting in touch with the trading class. American wares are advertised there as elsewhere by finely illustrated catalogs, perhaps printed in Spanish and English, but I will tell you what is done with these. If a Colombian merchant sees a picture of a machine or other articles which he would like to obtain he cuts it out of the catalog with a description, pastes it on a sheet of paper and sends it to Germany. If the Germans do not have it, they will make one like it and fill the order. This is one way in which Germany, for instance, is benefited at the expense of the United States. If American exporters establish warehouses in the Colombian cities with samples of goods, place the warehouses in charge of men who can speak the language and have sufficient tact to get in touch with the people, there is a fair chance for them to secure much of the trade which now goes across the Atlantic.

I refer to this in detail because the canal may be an extensive advertisement for the United States in Colombia, since it will arouse the people more than anything else to the extent and influence of this country, but indirectly it may be a very important factor in the development of South America in two ways—the carrying out of the Pan-American Railroad scheme and the exploitation of the Colombian territory which lies between the waterway and the Bogotan Plateau. With the canal completed, it would become really one of the terminals of the railroad in question. This fact is of special moment, not so much to Colombia as to the other South American countries through which the railroad is projected for by it they could transport their products intended for Europe to the bank of the canal, to be loaded on steamships for Europe and North America. Thus it would be an encouragement to construct the southern portion of the Pan-American Line. There is no question but what a route through the isthmus is practical. A very large area of Colombia, known to be rich in natural resources, is as yet undeveloped. It contains large forests of valuable woods, and while gold and other mining has been carried on to a certain extent, rich deposits of minerals remain as yet untouched. With the building of the canal it is possible that American interest may be aroused in this territory, which lies to the south of the Panama route, and that the execution of the project may result in the investment of capital in mining and timber enterprises as the natural wealth of this region becomes known.

As I have already said, the completion of the canal is of no great moment to Colombia. The foreign interests are not concerned about it, since it will not affect the present service to Europe, for much of the commerce of the Republic is concentrated at the mouth of the Magdalena—the great shipping point for Northern South America. It will never be transferred to any other place, for the reason that this is the natural center for the ocean trade of the country, and neither the importance of Panama nor Colon will be increased when the isthmus is cut through so far as Colombian shipments are concerned.

If the present negotiations have a result which will continue the friendly relations of the two republics the canal will play an important part in the future peace of that section of the world, since on one side it will be protected by the United States, and on the other side by Colombia. It will present a barrier which will check the spread of revolution and do much toward insuring stability on the isthmus. I do not mean that it is needed to insure peace in Colombia, for such is the confidence which the people have in the present Government that there is no question but what they will support its policy, and there need be no fear of any uprising. Foreigners doing business there will also support the Government as a matter of policy, if not friendship, since their business may be endangered by political disturbances.

WASHINGTON, D. C.

Spencer's Nescience

BY BORDEN P. BOWNE, LL.D.

[Borden P. Bowne is Professor of Philosophy in Boston University. Altho he has lately been summoned for trial for heresy before the Methodist Conference of which he is a member, he has not been so much a writer on thology as on the philosophy which underlies theology, as indicated by the titles of his books, such as "Studies in Theism," "Theory of Thought and Knowledge." He has been known as a sharp critic from the first of the Spencerian philosophy.—EDITOR.]

I AM asked by THE INDEPENDENT for a paper respecting Mr. Spencer's agnosticism, its grounds and practical bearing.

Agnosticism itself is a term of such uncertain meaning that the dictionary is of little use to us. We have to gather its significance from the arguments by which it is supported and from the way the doctrine is used. The lexicon is sure to lead amateurs astray.

The great and classical expression of agnosticism is that of Kant. It rested upon a profound, epoch-making analysis of knowledge and its conditions. Kant's conclusion was that the speculative faculty must be restricted to the field of experience, and that the knowledge is only of phenomena. In this work Kant's aim was practical and ethical. He said, I destroy knowledge to make room for belief. All that is made out is the speculative incompetency of the understanding in matters lying beyond experience. But man is more than understanding; he is also will and conscience. Practical life, with its demands and ideals, remains and has absolute right of way. All speculative objections are set aside forever by limiting the speculative faculty to the field of experience; and, as for faith, it never rested upon metaphysics but upon life itself. Now of this practical life, God, freedom and immortality are absolute postulates, and we accept them on the warrant of life, and not because of metaphysical reasoning. This reasoning never had any practical influence, and nothing is lost when we discern its theoretical worthlessness.

This was Kant's essential thought. The exposition was often inconsistent, and every true Kantian must transcend Kant. It is not surprising that one who effected a revolution in philosophy like that wrought by Copernicus in astronomy should have failed to bring the work into perfect form. But as the result of Kant's work the primacy of life over speculation is forever established, and the confident dogmatism of pre-Kantian rationalism is made impossible. Technical knowledge is set aside, but room is made for belief and life is given full right of way. This view has great practical value. It is not to be held, indeed, without much modification; but, when all changes are allowed for, it will still have great and abiding value.

In comparison with this Kantian conception the agnosticism of Mr. Spencer is weak and superficial. From a critical standpoint it never had any importance, tho it had considerable factitious significance, owing to the circumstances of the time. It claimed to reconcile science and religion, and thus gained favor with certain religious thinkers, who took the reconcilation on trust without looking into it. To be sure they were told that "the basis of reconcilation must be this deepest, widest and most certain of all facts"—that "the Power which the universe manifests to us is inscrutable;" but, inasmuch as it was called a reconciliation, they supposed it must be such. Further, the doctrine permitted free speech to science, while it enjoined perpetual silence upon religion and left it staring into rayless darkness; and thus it was not without attraction to many scientists, as it was no small relief to be clear of the theologians. But there was no profound analysis, no speculative insight, no consistent logic in the work. There was little more than a formulation *ad hoc* of the temper of the time. It was, indeed, in full harmony with the *Zeitgeist;* but in the long run logic has its way, even with *Zeitgeister.*

Mr. Spencer's method in establishing his agnosticism consists in convicting the mind of fundamental contradictions in all its basal ideas. A chapter on "Ultimate Religious Ideas" claims to show that these ideas are essentially contradictory and self-destructive. A similar chapter on "Ultimate Scientific Ideas" reaches the same conclusion for them. Another chapter on the "Relativity of All Knowledge" aims to show that knowledge, by its very nature, is limited to the phenomenal and can never reach the real. Thus knowledge, both as product and as process, is discredited. The truly real is forever unknowable.

In estimating this result we need to consider Mr. Spencer's general conclusion and also the particular arguments offered.

The logic of the general argument should give us pure Pyrrhonism. The ideas of first cause, absolute, infinite, space, time, matter, motion, force and conscious mind are all unthinkable. Thus theology, physics and psychology are made impossible at a stroke. Even mathematics, the science of pure space, time and motion, is likewise impossible. Theology is no more impossible than mathematics and physics, for the basal ideas of all alike are equally self-destructive. All alike, therefore, should be put under bonds to keep the peace. This is the manifest conclusion of the Pyrrhonistic reasoning.

And Mr. Spencer insists upon the full conclusion with reference to religion. We are not to think of God at all, except as the omnipresent mystery. We are not to affirm reason, consciousness, intelligence, least of all personality, of this mystery. Mr. Mansel had insisted on a "regulative theology." We cannot conceive God to be personal and infinite, he said, but we must nevertheless think of him as such. This notion Mr. Spencer repudiates with warmth, and declares that if there be truth in the argument, it is not our duty to say anything about God. "Our duty is to submit ourselves to the established limits of our intelligence, and not perversely to rebel against them." The opposite view but illustrates "the impiety of the pious."

As against Mansel logic is certainly with Mr. Spencer; but what puzzles the critic is to know how this injunction of perpetual silence, thus rigorously imposed on religion, can be escaped by science. The logic is the same in both cases. Ultimate religious ideas are no more "pseud" and impossible than ultimate scientific ideas. If the reasoning be sound, we have only a "regulative physics," which is quite as obnoxious to logic as a "regulative theology." But if a valid physics is possible, in spite of the impossibility of the ultimate ideas, why is not a valid theology equally possible? Let us grant that our knowledge is all symbolic, the question still arises, How do we know that physical and material symbols better represent the fact than spiritual and intellectual symbols? If it be said that none of our symbols at all represent the fact, then our physics is only a subjective dream; but if it be allowed that thought symbols more or less well represent the fact, then we must know which symbols do it best. Are we further from the fact when we think of the unknowable reality as a blind mechanical force, or as a conscious and free spirit? Mr. Spencer says the teachers of the popular religious view

> "assume that the choice is between personality and something lower than personality; whereas, the choice is rather between personality and something that may be higher."

In that case it would seem that religion is nearer the truth than physics. Here is the dilemma: If our symbols do not even adumbrate the fact, there is no reason for calling them symbols, and they are worthless in any case. But if they do adumbrate, and if the personal symbols stand nearer the supreme mystery than mechanical symbols, we can only conclude that religion outranks science in its approximation to that mystery. If, then, it be an "impiety of the pious" when they seek to impose their personal symbols upon the Unknowable, it is plainly a still more grievous impiety when the scientist seeks to impose his mechanical symbols upon it!

The fact is that Mr. Spencer never had any clear idea of what the Unknowable is, or of what the foundations of science are in his system. Commonly the Unknowable is the Real, the Fundamental Reality, of which we can know

only that it is; all other knowledge is of appearance. Kant had made current the doctrine which limits knowledge to phenomena, and Comte had restricted science to the study of phenomena. This made it easy for Spencer to assume as a matter of course that science deals with phenomena, and that the meaning of the term is perfectly clear. But this is not the fact. What is a phenomenon and where is its place? Is it special to me, or is it common to all? If only special to me, we have a solipsistic individualism. But if common to all, the phenomena would seem to be independent of each and all of us. What and where are they, then? They are not things, and they are not *thinks*. They are not subjective in the sense of belonging to the individual, and they are not objective in the sense of being substantive realities. This is the difficulty in all modern doctrines of phenomenal knowledge, and this is the source of the constant contradiction in Kant's exposition of his theory. This puzzle can be solved only on the plane of theistic idealism. Phenomena as such can exist only for the percipient mind. If now they are independent of any and all finite minds, there must be an Infinite Mind as their place and condition. And what Kant failed to consider Mr. Spencer seems never to have dreamed of, at least in its deep significance. For him matter and motion are only symbols, appearances, phenomena; but he nowhere intimates that they depend only on us; for in that case the whole evolution process would be no objective fact, but only a subjective arrangement of our ideas; we should be lost in what Mr. Spencer calls "the insanities of idealism." Matter is declared to be a "relative reality" standing in indissoluble relation with the absolute reality, and "being equally persistent with it," is "equally real." But reality is defined as "persistence in consciousness," and this definition is further confused by a chronic uncertainty whether persistence in consciousness is the *meaning* or the *mark* of reality—two very different things.

Phenomena, then, seem to be independent of us, and thus a further complication arises respecting their relation to the Unknowable. If the Unknowable remained rigidly one and changeless, like the Being of the Eleatics, there would be no assignable connection between it and the world of manifold and changing phenomena. Then the latter world would go along by itself, and the Unknowable would become useless. Under the influence of these considerations Mr. Spencer tends to make the changes, successions and likenesses among appearances point to changes, successions and likenesses among the unknown realities themselves, a view which Mr. Mill said would lead to a "prodigious amount of knowledge respecting the Unknowable." Yet we have to choose between making phenomena independent of the Unknowable, thus discharging the phenomenalism and dispensing with the Unknowable, or making them in some sense revelatory of the Unknowable, thus discharging the agnosticism to that extent.

Indeed, it has long been evident that a complete agnosticism is impossible. The affirmation of something which simply is, without any assignable attributes, is merely a form of words without any real attribution. If I say, to use a form of Mr. Mill's, Humpty Dumpty is abracadabra, I must be judged to have said nothing; because neither subject nor predicate has any contents. This appeared long ago in the criticism of Kant's "things in themselves." When the categories of thought were made strictly relative it became plain that the things in themselves were not only unknowable but unaffirmable, and that they must come to some extent within the range of thought, or go out of existence. The matter is not helped by Mr. Spencer's indefinite or unformulated consciousness of the absolute, which is an attempt to escape this difficulty. When definite content is entirely omitted, we have nothing left but the bare conception of existence "suspended *in vacuo* in the imagination."

Accordingly we find Mr. Spencer full of inconsistency in this matter. When he is dealing with religion he tells what he means by the Unknowable by forbidding any attribution whatever, and any other notion suggests "the impiety of the pious." Nevertheless, when he gets clear of the theologian, Mr. Spencer affirms many attributes. For instance, the Unknowable is one and not many, thus deny-

ing all dualistic and pluralistic theories. Mr. Spencer's argument, such as it is, would only give us unknowables, not one Unknowable—a fallacy in which he had been preceded by Kant, who passed without warrant from things in themselves to the "Thing in itself." Furthermore, the Unknowable is the real as opposed to the apparent, thus cutting off positivism. It is a power and fundamental cause. It is the inscrutable energy on which all things depend and from which they forever proceed. It is persistent and unchangeable. It is omnipresent in space and time. Surely here is an embarrassing richness of affirmation about that of which no affirmation may be made, or, to use Mr. Mill's phrase again, a "prodigious amount of knowledge respecting the Unknowable." If we are allowed to say so much, there seems to be no good reason why we might not go one step further and affirm intelligence of it, if the facts call for it. After all, judging by his practice, Mr. Spencer's objection to predication respecting the Unknowable seems to be confined to the personal predicates on which theism insists. Such inconsistency was unavoidable in the nature of the case.

Thus it appears that Mr. Spencer's agnosticism is an extremely vague and uncertain doctrine in both meaning and application. It is now in order to give a specimen of the arguments by which it is supported.

In discussing ultimate religious ideas Mr. Spencer points out that theism, atheism and pantheism are alike untenable, because they all posit somewhere the idea of self-existence; and this, in turn, is a "pseud" idea, because it implies existence through infinite past time, and this, again, would require infinite time to conceive it. This claim confounds thought and imagination. Time can never be *pictured* as infinite, for picturing requires limits; but, supposing time to be anything, it can never be *conceived* as finite; for as soon as we establish limits we become aware of more time beyond. The argument is worthless and is soon contradicted by Mr. Spencer himself; for the fundamental reality is throughout treated as self-existent and eternal, while in establishing the indestructibility of matter the claim is made that nothing whatever can be conceived as beginning or ceasing to be. We may conclude, then, that everything is eternal. Surely even "the pious" hardly need be alarmed by arguments of this kind.

The argument for the incompatibility of the notions of the absolute, the infinite and first cause, which Mr. Spencer quotes with approval from Mansel, are so purely verbal and artificial that Mr. Mill queries whether Mansel was really "serious" in presenting it. "Can a writer," he asks, "be serious who bids us conjure up a conception of something which possesses infinitely all conflicting attributes, and because we cannot do this without contradiction, would have us believe that there is a contradiction in the idea of infinite goodness or infinite wisdom?" The argument is throughout from the etymology of the words rather than from their philosophical meaning. The same is true of the argument for the relativity of knowledge. It is so purely verbal and artificial as scarcely to rise to the dignity of a sophism.

At a pretty early date, at least thirty years ago, Mr. Spencer's abler disciples, as Mr. Youmans, began to be restive under this inconsequent agnosticism; and they pointed out that it is really no part of his philosophy. In the last edition of the "First Principles," Mr. Spencer himself, in a postscript, points out that his doctrine of science, evolution, etc., is quite independent of his doctrine of the Unknowable. This can hardly be allowed without limitation. The Unknowable comes in frequently in Part II to help the limping argument over the stile. In particular, without it the system would sink into materialism. Evolution is defined in terms of matter and motion, and is made to include all the phenomena of life, mind and society. This would be crass materialism, but for the demurrer, duly made, that matter and motion are but symbols of the inscrutable power which underlies phenomena. A Spencerian might well labor to tell us in what sense they are symbols, and what their objective relation to the inscrutable power may be, but he should be careful to hold on to that power and its inscrutability, lest he see his system lapse into vulgar materialism and atheism.

Enough has been said to show that as

a philosopher Mr. Spencer can hardly be accorded high rank. His work began about the same time as the great naturalistic revival of the generation just past, and he became the official philosopher of the movement. In this way he acquired a prestige beyond what his speculative work deserves. It was a time of loose and yeasty thinking, with great evolution of speculative gas. Bubbles covered with prismatic colors looked solid. It was just the time for the philosophical impressionist; and Mr. Spencer, with his big canvas and big brushes, was just the man for the time. But works of art produced in this way suffer from close inspection. Grandiosity must be viewed at a distance. A good illustration of both the good intentions and the uncritical thinking of the time is seen in the following passage, in which Mr. Spencer showed how the advanced thinker should bear himself toward traditional beliefs:

"He must remember that, while he is a child of the past, he is a parent of the future, and that his thoughts are as children born to him which he may not carelessly let die. He, like every other man, may properly consider himself as one of the myriad agencies through whom works the Unknown Cause; and when the Unknown Cause produces in him a certain belief he is thereby authorized to profess and act out that belief."

This needs no criticism beyond the reflection that "every other man," say the theologian or Mr. Spencer's critics, is in the same position; and every other man's beliefs, of whatever sort, have the same august origin and sanction.

So Mr. Spencer wrote forty years ago. In his last work, "Facts and Comments," published in 1902, he returns to the same topic, and is no longer so sure or optimistic. Then he said, "Not as adventitious, therefore, will the wise man regard the faith which is in him. The highest truth he sees he will fearlessly utter." Now he says:

"Sympathy commands silence toward all who, suffering under the ills of life, derive comfort from their creed; while it forbids the dropping of hints that may shake their faiths, it suggests the evasion of questions which cannot be discussed without unsettling their hope." "And there are many who stagger under the exhausting burden of daily duties, fulfilled without thanks and without sympathy, who are enabled to bear their ills from the conviction that after this life will come a life free from pains and weariness. Nothing but evil can follow a change in the creed of such; and unless cruelly thoughtless the agnostic will carefully shun discussing religious subjects with them."

There the man got the better of the philosopher. Truth is a dangerous drug and must be judiciously administered. The gospel of agnosticism may do for well-fed and prosperous pachyderms; but the weary and heavy-laden must still turn to Moses and the prophets, and the Man of Nazareth. And, seeing that they, too, were "agencies through whom worked the Unknown Cause," Mr. Spencer himself seems to justify us in holding to them for the present.

BOSTON, MASS.

Woman and the Peace Movement

BY BJÖRNSTJERNE BJÖRNSON

This Year's Recipient of the Nobe Prize for the Greatest Creative Work of Literature

YOU have probably seen on the big maps the finely dotted lines which resemble the wake of a transatlantic steamer. They mark the routes taken by these big ships, sailing from country to country and from continent to continent. We old people well remember the time when there were only three or four or five of these dotted lines. But there are so many of them to-day that they run together and form one broad, black line. Think what is carried along these lines from nation to nation, what quantities of passengers, what immense packages of newspapers and letters!

This leads one to think of the invisible lines traced by human love which show us the way to satisfy our longing for better things and wider liberty. But unfortunately not a sufficient number of passengers sail along these lines, and more especially not enough women, which is a serious obstacle to the solution of that great international problem which ever stares us in the face—the putting an end to war.

It does not suffice to have the power to impose your will. You must go down deeper to the root of the evil and modify man's ideal concerning the morality of war, putting in its place the ideal which every high-minded woman of our time ought to enshrine in her heart. Not till then will war cease.

A man's greatness is not to be measured by the blow that he can give, but by the spirit of consideration which he shows. Self-control should be his highest virtue. Woman recognizes the truth of this, for she has sadly suffered by disregard of this principle. She has been held in subjection, due entirely to the ruling influence of the war ideal.

Side by side with the dotted line on which moves the Woman Question, where, by the way, there are too few passengers, run two other lines which join, all three, in the end, for they all are directed toward the same end. These other two lines are the Labor Question and the Peace Question. All three need the help of woman, not alone for their own sake, but for hers too.

I once saw in Germany this inscription over a door: "The Home is the World of Woman; the World is the Home of Man." If the world of either were changed, it would be a mistake. This conception of her *rôle* has given woman heart under difficulties. We all know the story of the man alone at home trying to keep house, and the more significant fact as to how very badly everything went in the world when he tried to keep house alone there. We perceive this almost daily in what is going on around us. It ought to open our eyes to the reality. The man's ideal, this keeping house alone, must give place to the woman's ideal, the joint housekeeping of both. Woman cannot be properly developed if she is shut up within herself. We cannot grow unless our human love, our sympathies and our thirst for intellectual food draw support from the outside world. So it is with the plants kept within doors, which, put out in the sunshine and the rain, send forth delicious perfume throughout our rooms when they are brought in again. The wings which are to shelter the home must become better feathered and stronger by exercise in the open air.

If woman takes a moral stand against war, she should so act not only in the eyes of the husband by her side, and in the sight of the playing children around her, but should feel in her own soul, as mother, the part she is playing. She should have a care that she is not practicing some sort of tyranny in the home circle, in the development of the children.

This war influence reveals itself in our religion, as witness the acts of the missionaries in the recent troubles in China, who brought the troops to their aid and were thus one of the causes of all the horrors that followed. The effort to

drive out of France last summer certain priestly orders required the intervention of bayonets. This state of things should not cause women, so closely allied with the Church, to hesitate in their opposition to war. They must not lose courage and feel that they can accomplish nothing. Much evil in which the Church is not implicated remains to be fought down. Who has forgotten that wicked nation-murder in South Africa? Who has not wept for Armenia, for Cuba, for Poland, for Sleswick? But these crimes could not be prevented, because there were not female passengers enough on those dotted lines! There was the fault. If a protesting cry were to come from millions of women's voices; if the ring which wrong doing draws around a good cause were broken by countless nays coming from all the nations of the world, we would then see the effect of such a pacific intervention. This it was that freed Crete. The same with Cuba; and if America, tho there was a little too much of the spirit of self-interest in the act, accomplished this noble result and has finally been forced to grant the young republic considerable independence — this, too, is due to a great protest against any other course. And what a large part the women of the United States took in this protest!

CHRISTIANIA, NORWAY

Souvenirs of Björnstjerne Björnson

BY THEODORE STANTON

BJORNSTJERNE BJORNSON

DURING my residence in Paris, Björnson has made two long visits to this city. In the eighties, he spent several seasons here, and again, in the winter of 1901, he passed two or three months in the French capital. On both of these occasions I saw much of him, and a few brief souvenirs of these meetings may be found interesting.

At first Björnson occupied with his wife and several of his children a modest apartment in the Avenue Niel, whence he moved later to the Rue Faraday, where his windows overlooked a large deserted garden, in which the pine trees, shrubs and grass were green all the winter through. He loved to feast his eyes on them when the telegrams told of ice and snow in his beloved Norway.

Literary Paris, then even more ignorant than to-day of everything happening beyond the Grand Boulevards, seemed unaware of the fact that it had in its midst one of the most famous personalities of the Scandinavian world. So Björnson's long sojourn in the City of Light passed almost unnoticed. With the exception of friends in the Teutonic colonies of Paris scarcely anybody found his way to the delightful fireside in the Rue Faraday, where all the great problems of the hour were discussed, and, what was more agreeable, discussed on a lofty plane.

In Paris political circles, too, the presence of this bold republican of the north caused scarcely a ripple of attention, and, republican France, which, tho it then had President Grévy in the Elysée, was still surrounded with the gravest monarchical dangers, did not seem aware of how

this grand figure might be used to awaken enthusiasm in the masses. The French Foreign Office was evidently afraid of offending Sweden if Björnson received any social official attention, for his struggle with King Oscar was then at its hight. In fact, it was then thought best by all parties that this uncompromising leader quit his own country, at least for a time, especially as his absence would not prevent him from fulminating through the columns of his organ at Christiania whenever he saw that a word from him could help on the good fight. So here, in Paris, this Grand Old Man lived for many months without making the acquaintance of probably one senator or deputy, and without even a reporter ferreting him out.

In Björnson's drawing-room, at this time, the Norwegian flag always hung in a conspicuous place over the mantelpiece. It was the guiding star of his daily life, especially when he was seated at his work-table. Scattered about the room were the Norwegian papers, which had been carefully read and marked, while on the writing-desk in the adjoining room was an article under way or just finished, which would soon appear in one of the leading newspapers of the Norwegian capital, and whose keynote was the demand for the better understanding which now fortunately characterizes the relations between the two sister kingdoms of the north, thanks, in large measure, to the articles and speeches of Björnstjerne Björnson.

A frequent subject of conversation during our walks through the streets of Paris—the streets of Paris, by the way, always interested Björnson keenly—was his visit to America a few years before, and he always expressed a wish to repeat the pleasure. In fact, the idea of doing so has never been wholly abandoned, tho now, on account of Björnson's rapidly advancing years, it is very improbable that the favorite dream will ever be realized.

Another topic of conversation was the political situation in France, which Björnson, as a republican, had very near his heart. He had very little patience with Opportunism, the dilly-dally policy inaugurated by Gambetta, but was for more radical measures that would bring France into line with the true democratic and republican movement, represented in Europe by Switzerland and in the New World by the United States. Such a policy he then advocated for his dear Norway, where he then hoped his republican ideal was soon to be realized. He trusted that, with France a republic in Central Europe and Norway a republic in the north, Castelar, whom he much admired, would be able to bring Spain over to "the right side," when Portugal and Italy would very likely follow the good example. It will thus be seen that this sturdy republican was rather optimistic some fifteen years ago.

But when Björnson made his last visit to Paris, in 1901, I found him changed in several ways. Of course, he had aged, but he was different not so much physically as mentally. His gigantic figure was still straight, there was no stoop in the shoulders, which supported the same large leonine head. The bushy hair had become tinged with gray, perhaps, but it was as thick as ever, and I noticed no obtrusive wrinkles in that broad expressive face, which was stern and gay by turns. He was now in the habit sometimes of wearing indoors a sort of student cap, which was most becoming, and gave him the air of a grand university president about to appear at some commencement festivity.

The most marked change I noticed in the Björnson of to-day was his friendlier feeling for Sweden. Tho he could not love Norway more, he evidently disliked Sweden less. In fact, he seemed to prefer to avoid the subject which formerly set his whole soul afire, to find more pleasure in considering broader and more general themes.

Björnson was in Germany during the critical period of the Dreyfus tragedy, and, of course, came out strongly in fa vor of the condemned officer. So he was naturally very desirous to meet the unfortunate captain. It so happened that we both had rendezvous with him for the same day, Björnson, in the afternoon, and I in the morning on business connected with the publication in America of his famous *Journal*. I met Björnson at dinner a night or two later, and we naturally compared our impressions. I found that he had not discovered in

Dreyfus all that he had expected, and when I related that the brother-in-law with whom I had transacted the business side of my visit, was bent on making all that could be made out of the sale of the *Journal,* Björnson was so shocked that he exclaimed with much earnestness: "What, is it possible that they wish to dispose of those recollections for money!" And then, abandoning French, which always hampered him, Björnson declared with increased energy: "Das muss nicht sein."

Björnson's championing of Dreyfus brought to him, during this visit, all the leading "Dreyfusards," an intellectual *élite,* which he much enjoyed, outside of the fact that they had stood by the "poor Jew." But this was not the only interesting class of Paris society that found its way to the stylish salons of the Rue de la Pompe. The literary world had learned his worth this time, and French dramatic circles proposed that a specimen of Björnson's theatrical art be offered to the Paris public. So one cold winter's night, in a half heated theater, a single performance of that rather heavy and too philosophical—at least for a Parisian public—play, "Beyond Human Strength," was given. Björnson watched the piece from a private box, was warmly received by a large and distinguished public, was applauded, bowed his acknowledgements several times, but went home pleased neither with the way in which the play was acted nor with the reception given it by the audience, and later by the newspaper critics, perhaps the most notable body of writers on the Paris press. This circumstance contributed largely, I think, to the criticism of French taste in literary matters in which he indulged when on the eve of quitting France, and which stirred up rather a hostile conflict, in the midst of which he left for Berlin, where, at a public dinner, he again expressed himself rather freely in regard to the narrow views of literature held in France. A report of this speech was, of course, sent on to Paris, and Björnson was again subjected to a pretty severe treatment on the part of the talented Boulevard critics. But if the great poet of the north left Paris under fire, he retreated with colors flying, and defiance in his eye.

PARIS, FRANCE.

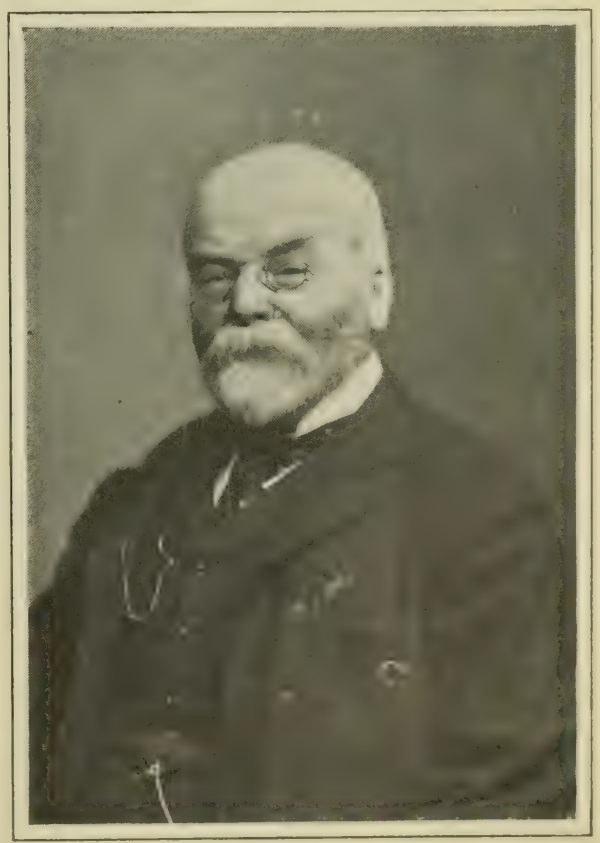
What We Are Thinking About in England

BY JUSTIN McCARTHY

FIRST of all, we, or at least those of us who take any interest in politics, are thinking about the approaching session. The opening of the Houses of Parliament has been appointed by the King for the 2d of February, and we are eagerly speculating as to the position in which the Conservative Government will find itself after the earlier weeks of the session shall have done their work.

The principal question of doubt is whether the Government will seek to precipitate the General Election or will endeavor to hold on for another session or two in order to see what is to come of Joseph Chamberlain's projected political and financial campaign. If Ministers were to give any support even indirect to Chamberlain they might easily be turned out of office, because a large number of Conservative members, some of whom hold leading positions, are resolutely opposed to any tampering with the principle of free trade, and would go with the Liberals against Arthur Balfour's Government. If, on the other hand, Ministers were to declare once for all clearly and decisively against Chamberlain and his projects they would then, of course,

WILLIAM RANDAL CREMER



convert him and his Parliamentary followers into open and avowed enemies, and in that case any chance division on some motion of want of confidence brought forward from the benches of the Liberal Opposition might have a perilous effect on the fate of the Administration. The vote of the Irish Nationalist Party becomes a consideration of immense importance under such conditions; and it may be taken for granted that the Irish National vote will be guided entirely by the interests of Ireland and not by the relative claims of the Conservative or the Liberal Party. That vote is now so considerable in point of numbers that it becomes of momentous account at a crisis such as that through which England is soon to pass. The whole situation is intensely interesting and exciting, and I do not remember for many years back any political crisis during which the unexpected may be more likely to come to pass.

Then we are thinking and talking much of the loss England and the whole world have sustained by the death of Herbert Spencer. It is true that Spencer lived to an advanced age and that the great work of his life had been long since accomplished, and I have heard on good authority that even his autobiography had been fully completed and made ready for publication before this latest of his illnesses put an end to his great career. Still the removal of such a man from among the living cannot but fill the whole world with a sense of profound loss to the active forces of human intellect. It is not too much to say that England had not produced for many generations a greater thinker than Herbert Spencer. I had the honor of knowing him during my active lifetime, and of being associated with him in more than one important movement. For the greater part of his life Herbert Spencer had kept himself apart from public life and political organization of any kind. Some of my American readers will probably well remember that he first came out from his study as a secluded worker because of the crisis which arose in English political thought when the great American Civil War set in. The large majority of those in Great Britain who belonged to what is called "society" made themselves zealous and vehement champions of the South, while the men of thought, the leaders of the democracy and the industrial classes in general, went in heart and soul for the cause of the North. Then it was that Herbert Spencer became for the first time an active worker in public life. The same story may be told of that other great English thinker, John Stuart Mill, who came out of his cultured seclusion to lend his intellectual influence to the movement of those who were striving to bring English public opinion to the right side.

I had the honor of knowing Stuart Mill as well as Herbert Spencer. When William Lloyd Garrison was entertained at a public banquet in London, Herbert Spencer was one of the company, and I sat near to him at the table. I was associated with him as member of an organization formed for the purpose of obtaining a satisfactory system of international copyright between England and the United States, and there I had many opportunities of appreciating the keenness and the practical force of his intelligence when he brought it to bear on matters of business. A more modest, unassuming, and at the same time genial

and persuasive man, where argument had to be used and difficulties foreseen, I have never met. I may perhaps say, altho it has often been said before, that Herbert Spencer was earlier and more widely appreciated in the United States than in England. At the time when I paid my first visit to America Herbert Spencer was indeed recognized by cultured and thoughtful Englishmen as one of the world's great thinkers, but I found that in the United States he was known as such to a far larger body of admirers than he had yet obtained in his own country. I can well remember that I became a person of much interest in many American circles from the mere fact that I could describe myself as personally acquainted with Herbert Spencer. I had not seen him for several years before his death, but I sometimes interchanged words of greeting with him by letter or telegraph, and he appears up to the last to have maintained his interest in the intellectual and political movements of the outer world. With him has passed away the last of the great thinkers who made England for a long time the center of intellectual growth—men like Darwin, Huxley, John Stuart Mill, Tyndall and John Henry Newman. An era of thought closed with Herbert Spencer's death.

A man of great mark and influence in his working lifetime has been removed from among us by the death of Sir John R. Robinson. For the last two or three years he had withdrawn from his active association with journalism, but no man had been more successful as the manager of a great newspaper than Sir John Robinson was while he conducted the business affairs of *The Daily News*. He began his newspaper work while a very young man, as sub-editor of a journal started by Douglas Jerrold, and he was a friend of Dickens, Thackeray, Lever and other literary celebrities of the past. He then became attached to *The Daily News*, a paper which my American readers know was founded by Dickens, and Robinson rose to be manager of the paper at a time when, after Dickens's withdrawal from it, the journal seemed to be in very sinking fortunes. Robinson had a positive genius for putting life into a newspaper and much of his genius proved itself by his capacity for finding out the right men for the right places in the work of a daily newspaper. He discovered Archibald Forbes as a war correspondent, and, indeed, every discovery which he made when choosing suitable men as writers for *The Daily News* may be said to have been a striking success. Robinson was, however, not by any means merely the kind of man who knows how to conduct a newspaper as a matter of paying speculation. He was a man of the highest principle, a genuine and devoted Liberal, an unwavering friend of liberty, progress and peace. *The Daily News* and *The Morning Star* were the two daily newspapers in London which firmly held to the side of the North during the American Civil War. I had known Robinson for more than half a lifetime, and I always entertained for him the warmest feeling of friendship, a feeling which was I believe kindly and cordially reciprocated bv him. He was in every sense a true friend to his friend. He was a man of quiet and retiring habits, who hardly ever appeared upon a public platform or accepted any opportunity of making a speech. He was a brilliant writer in his early days, but

SIR JOHN R. ROBINSON

during all the later part of his career he had confined himself to the management of the newspaper, and found other men to do its literary work in the best possible way.

I return now to the living. We have been talking much of late about William Randal Cremer, one of the small group of workingmen who are members of the House of Commons. Cremer has just been awarded the Nobel Prize for services rendered to the cause of humanity and peace. This prize, like all the others of its kind, is, even from the lowest point of view, one well worth having, for it amounts in this instance to nearly £8,000 sterling. The Nobel prizes are taken from a fortune of some two millions of money, according to our English figures, bequeathed by Alfred Nobel, the famous Swedish discoverer of the properties of dynamite, who died in 1896 and left by his will large sums to be distributed at stated intervals for those who had done the best for science, literature and practical beneficence to humanity. Cremer had of late years given up his whole activity to the promotion of measures for securing peace among nations by the establishment of international tribunals and he has preached his doctrines again and again throughout Europe and the United States. He began life as a working carpenter and he has never shown any ambition to exalt himself above the social level of his class, a class to whose education, intellectual advancement and happiness he has rendered unceasing service. In the House of Commons he has obtained, as John Burns and other workingmen members have done, the respect and admiration of all parties and all sections. I had the honor of knowing Mr. Cremer while I was a member of the House and have been associated with him in many public organizations. The Nobel prizes, I should say, are only awarded after the most careful examination by qualified organizations, and this year the prize given for the most distinguished work of an idealistic character is awarded to Dr. Björnstjerne Björnson. The Committee of the Society of Authors has decided to recommend for the prize of the coming year the name of Mr. Algernon Charles Swinburne. The final selection, so far as the Society of Authors is concerned, and I may say that I have the honor of being a member of that body, will be settled by the vote of the majority of the whole society. When this vote is taken the name of the chosen candidate will be sent to the Nobel Committee of the Swedish Academy, and the recommendation will no doubt not be without some effect on the award of the Nobel Prize.

The lovers of fiction are talking much just now about the new novel by Mr. E. W. Hornung, called "Denis Dent." Mr. Hornung is one of the most successful and artistic among our younger novelists, and this latest work of his seems to me to display many and, indeed, most, of his finest characteristics. This is a strong book in every sense of the word; it is full of adventure on sea and shore; its characters are like-life and seem to illustrate naturally the peculiar order of human growth and experience to which each belongs, and I think it might fairly be described as a story which combines, in elements of equal proportion, the properties of romance and realism. I cannot bear any higher testimony to the author's faculty for giving new and thrilling life to old and common incidents of romance than when I say that the hero rescues the heroine from a wrecked ship, and that Mr. Hornung has made the event as intensely interesting and as seemingly original as if no hero of a novel had ever rescued the heroine from a wreck before the composition of "Denis Dent." The scene of the greater part of the story lies in the Australian diggings at the time when Australia first followed the example of California, and proved herself the possessor of gold mines. Nothing could be more robust and vigorous and at the same time carefully exact in all its practical details than the description given of the manner of life led by the Australian diggers of those early days. The reader seems for the time as if he were actually studying on the spot the mapping out of the claims, the ways of the rough communities, and the strange variety of figures brought together from all parts of the world. "Denis Dent" is emphatically what must be called a "live" book from end to end.

Mr. Austin Dobson has done a good

service to literature by preparing and publishing a life of Frances Burney, the gifted woman whose earliest novels were so warmly admired by Dr. Johnson, read with such eager interest and praised with such eloquent eulogy by Edmund Burke, novels which may fairly be said to have opened a new chapter in English literature. I do not know whether there are many readers of the present day in England or in America who take much account of "Cecilia," "Evelina," and other of Miss Burney's novels, and I think I might venture to say that a large proportion of highly intelligent readers have never read any of them. The world will owe much to Mr. Austin Dobson if he succeeds in recalling public attention to those now neglected creations of a literary genius which entitles Frances Burney to a place in the highest rank of English novelists. Mr. Dobson's volume is a charming production, worked out with artistic skill and literary sympathy, and is well worthy of its subject and its author. I am glad to see that Messrs. Macmillan, who publish Mr. Dobson's volume, are announcing a new and popular edition of Miss Burney's "Evelina."

LONDON, ENGLAND.

The Mystery of Kaspar Hauser

BY ANDREW LANG

[We hope to publish during the year several articles from Mr. Lang on the great Historical Mysteries of the world. It is hardly necessary to say that no one is better qualified for this task, whether as a student of history or as a skilled writer, than is Mr. Lang.—EDITOR.]

DARKNESS in Karlsruhe! 'Tis the high noon of night: October 15, 1812. Hark to the tread of the Twelve Hours as they pass on the palace clock, and join their comrades that have been! The vast corridors are still: in the shadows lurk two burly minions of ambitious crime, Burkard and Sauerbeck. Is that a white moving shadow which approaches through the gloom? There arises a shriek, a heavy body falls, 'tis a lackey who has seen and recognized *The White Lady of the Grand Ducal House*, that walks before the deaths of Princes. Burkard and Sauerbeck spurn the inanimate body of the menial witness. The white figure, bearing in her arms a sleeping child, glides to the tapestried wall, and vanishes through it, into the chamber of the Crown Prince, a babe of fourteen days. She returns, carrying *another* unconscious infant form; she places it in the hands of the ruffian Sauerbeck, she disappears. The cloaked miscreant speeds through a secret postern into the park, you hear the trample of four horses, and the roll of a carriage on the road. Next day there is silence in the palace, broken but by the shrieks of a bereaved tho royal mother. Her babe lies a corpse! The Crown Prince has died in the night! The path to the throne lies open to the offspring of the Countess Von Hochberg, morganatic wife of the reigning Prince, Karl Friedrich, and mother of the children of Ludwig Wilhelm August, his youngest son.

Sixteen years fleet by, years rich in royal crimes. 'Tis four of a golden Whit Monday afternoon, in old Nuremberg, May 26th, 1828. The town lies empty, dusty, silent; her merry people are rejoicing in the green wood and among the suburban beer-gardens. One man alone, a shoemaker, stands by the door of his house in the Unschlitt Plas; around him lie the vacant streets of the sleeping city. His eyes rest on the form, risen as it were out of the earth or fallen from the skies, of a boy, strangely clad, speechless, incapable either of standing erect or of moving his limbs. That boy is the royal infant placed of yore by the White Shadow in the hands of the cloaked ruffian. Thus does the Crown Prince of Baden return from the darkness to the daylight! He named himself Kaspar Hauser. He is to die by the dagger

of a cruel courtier, or of a hireling English Earl.

Thus briefly, and, I trust, impressively, have I sketched the history of Kaspar Hauser, "the Child of Europe," as it was accepted by half Germany, and presented by various foreign pamphleteers, and, in 1892, by Miss Elizabeth E. Evans. But, as for the "authentic records" on which the partisans of Kaspar Hauser based their version, they are anonymous, unauthenticated, discredited by the results of a libel action in 1883; and, in short, are worthless and impudent rubbish.

On all sides, indeed, the evidence as to Kaspar Hauser is in bewildering confusion. In 1832, four years after his arrival, a book about him was published by Paul John Anselm Von Feuerbach. The man was mortal, had been a professor, and, tho a legal reformer and a learned jurist, was "a nervous invalid" when he wrote, and he soon after died of paralysis (or poison, according to Kasparites).

Taking Feuerbach's romantic narrative of 1832, we find him averring that, about 4.30 P.M. on Whit Monday, May 26th, 1828, a citizen, unnamed, was loitering at his door, in Unschlitt Plas, Nuremberg, intending to sally out by the New Gate, when he saw a young peasant, standing in an attitude suggestive of intoxication, and apparently suffering from locomotor ataxia, "unable to govern fully the movements of his legs." The citizen went to the boy, who showed him a letter directed to the captain of a cavalry regiment. The gallant captain lived near the New Gate (654 paces from the citizen's house), and thither the young peasant walked with the citizen. So he *could* "govern fully the movements of his legs." At the house, the captain being out, the boy said, "I would be a horseman as my father was," also "Don't know." Later he was taken to the prison, up a steep hill, and the ascent to his room was one of over ninety steps. Thus he could certainly walk, and when he spoke of himself he said "I" like other people. Later he took to speaking of himself as "Kaspar," in the manner of small children and some hysterical patients under hypnotism. But this was an after-thought, for Kaspar's line now was that he had only been taught a few words, like a parrot, words which he used to express all senses indifferently. His eyesight, when he first appeared, seems to have been normal; at the prison he wrote his own name as "Kaspar Hauser," and covered a sheet of paper with writing. Later he could only see in the dark.

So says Feuerbach, in 1832. What he does not say is whence he got his information as to Kaspar's earliest exploits. Now our earliest evidence, on oath, before a magistrate, is dated November 4, 1829. George Weichmann, shoemaker (Feuerbach's anonymous "citizen"), then swore that, on May 26th, 1828, he saw Kaspar, not making paralyzed efforts to walk, but trudging down a hilly street, shouting "Hi!" ("or any loud cry"), and presently asking, "with tolerable distinctness," "New Gate Street?" He took the boy that way, and the boy gave him the letter for the captain. Weichmann said that they had better ask for him at the New Gate Guard House, and the boy said, "Guard House? Guard House? New Gate no doubt just built?" He said he came from Ratisbon, and was in Nuremberg for the first time, but clearly did not understand what Weichmann meant when he inquired as to the chances of war breaking out. In May, 1834, Weichmann repeated his evidence as to Kaspar's power of talking and walking, and was corroborated by one Jacob Beck, not heard of in 1829. On December 20th, 1829, Merk, the captain's servant, spoke to Kaspar's fatigue, "he reeled as he walked," and would answer no questions. In 1834 Merk expanded, and said "we had a long chat." Kaspar averred that he could read and write, and had crossed the frontier daily on his way to school. "He did not know where he came from." Certainly Merk, in 1834, remembered much more than in 1829. Whether he suppressed facts in 1829, or, in 1834, invented fables, we do not know. The cavalry captain (November 2d, 1829) remembered several intelligent remarks made by Kaspar. His dress was new and clean (denied by Feuerbach), he was tired and footsore. The evidence of the police taken in 1834 was remote in time, but went to prove that Kaspar's eyesight and power of writing were normal. Feuerbach absolutely discredits all the sworn evidence of 1829, without giv-

ing his own sources. The evidence shows that Kaspar could both walk and talk, and see normally, by artificial and natural light, all of which is absolutely inconsistent with Kaspar's later account of himself.

The personal property of Kaspar was a horn rosary, and several Catholic tracts with prayers to the guardian angel, and so forth. Feuerbach holds that these were furnished by "devout villains"—a very sound Protestant was Feuerbach—and that Kaspar was ignorant of the being of a Deity, at all events of a Protestant Deity. The letter carried by the boy said that the writer first took charge of him, as an infant, in 1812, and had never let him "take a single step out of my house. . . . I have already taught him to read and write, *and he writes my handwriting exactly as I do.*" In the same hand was a letter in Latin characters, purporting to come from Kaspar's mother, "a poor girl," as the author of the German letter was "a poor day laborer." Humbug as I take Kaspar to have been, I am not sure that he wrote these pieces. If not, somebody else was in the affair; somebody who wanted to get rid of Kaspar.

How Kaspar fell, as it were from the clouds, and unseen, into the middle of Nuremberg, even on a holiday, when almost every one was out of town, is certainly a puzzle. The earliest witnesses took him for a journeyman tailor lad (he was about sixteen), and perhaps nobody paid any attention to a dusty traveling tradesman, or groom out of place. Feuerbach (who did not see Kaspar till July) says that his feet were covered with blisters; the jailer says that they were merely swollen by the tightness of his boots.

Once in prison, Kaspar, who asked to be taken home, adopted the *rôle* of "a semi-unconscious animal," playing with toy horses, "blind tho he saw," yet, not long after, he wrote a minute account of all that he had observed. He could only eat bread and water: meat made him shudder, and Lord Stanhope, who later befriended him, says that this peculiarity did occur in the cases of some peasant soldiers. He had no sense of hearing, which means, perhaps, that he did not think of pretending to be amazed by the sound of church bells till he had been in prison for some days. Till then he had been deaf to their noise. This is Feuerbach's story, but we shall see that it is contradicted by Kaspar himself, in writing. Thus the alleged facts may be explained without recourse even to a theory of intermittent deafness. Kaspar was no more deaf than blind. He "was all there." In 1829 he completed a work of autobiography.

Kaspar, he wrote, till the age of sixteen was kept in "a prison," "perhaps six or seven feet long, four broad and five high." There were two small windows, with closed, black, wooden shutters. He lay on straw, lived on bread and water, and played with toy horses, and blue and red ribbons. That he could see colors in total darkness is a proof of his inconsistent fables, or of his "hyperesthesia"—abnormal acuteness of the senses. "The man" who kept him was not less hyperesthetic, for he taught Kaspar to write in the dark. He never heard any noise, but avers that, in prison, he was alarmed by the town clock striking, on the first morning, tho Feuerbach says that he did not hear the bells for several days.

Such is Kaspar's written account (1829); the published account of July, 1828, derived from "the expressions of a half dumb animal" (as Feuerbach puts it), is much more prolix and minute in detail. The animal said that he had sat on the ground, and never seen daylight, till he came to Nuremberg. He used to be hocused with water of an evil taste and wake in a clean shirt. "The man" once hit him and hurt him, for making too much noise. The man taught him his letters and the Arabic numerals. Later he gave him instructions in the art of standing. Next he took him out, and taught him about nine words. He was made by the man to walk he knew not how far, or how long, the man leading him. Nobody saw this extraordinary pair on the march. Feuerbach, who maintains that Kaspar's feet were covered with cruel blisters, from walking, also supposes that "perhaps for the greater part of the way" he was carried in a carriage or wagon! Whence, then, the cruel blisters caused by walking? There is medical evidence that his legs were distorted by confinement, but the medical *post mor-*

tem evidence says that this was not the case. He told Binder that his windows were shuttered; he told Hiltel, the jailer, that from his windows he saw "a pile of wood and above it the top of a tree."

Obviously Kaspar's legends about himself, whether spoken in June, 1828, or writtten in February, 1829, are absurdly false. He was for three weeks in the tower, and was eternally visited by the curious. Yet in these three weeks the half-conscious animal "learned to read tolerably well, to count, to write figures" (*that* he could do when he arrived, Feuerbach says), "he made progress in writing a good hand, and learned a simple tune on the harpsichord," pretty well for a half-unconscious animal.

In July, 1828, after being adopted by the excited town of Nuremberg, he was sent to be educated and live with a schoolmaster named Daumer, and was studied by Feuerbach. They found, in Kaspar, a splendid example of the "sensitive," and a noble proof of the powers of "animal magnetism." In Germany, at this time, much was talked and written about "somnambulism" (the hypnotic state), and about a kind of "animal magnetism" which, in accordance with Mesmer's theory, was supposed to pass between stars, metals, magnets and human beings. The effects produced on the patient by the hypnotist (now ascribed to "suggestion") were attributed to a "magnetic efflux," and Reichenbach's subjects saw strange currents flowing from metals and magnets.

In my view, Kaspar was, to put it mildly, an ambulatory automatist, who had strayed away from some place where nobody desired his return; rather his lifelong absence was an object of hope. The longer Kaspar lived the more frequently was he detected in every sort of imposture that could make him notorious, or enable him to shirk work.

Kaspar had for months been the pet mystery of Nuremberg. Some thought him a son of Napoleon; others averred (as we saw) that he was the infant son of the Grand Duke Charles of Baden, born in 1812, who had not died within a fortnight of his birth, but been spirited away by a lady disguised as the spectral "White Lady of Baden," an aristocratic *ban-shie*. The subtle conspirators had bred the Grand Ducal Kaspar in a dark den, the theory ran, hoping that he would prove, by virtue of such education, an acceptable recruit for the Bavarian cavalry, and that no questions would be asked. Unluckily, questions were now being asked, for a boy who could only occasionally see and hear was not (tho he could smell a cemetery at a distance of five hundred yards) a useful man on a patrol, at least the military authorities though not. Had they known that Kaspar could see in the dark, they might have kept him as a guide in night attacks, but they did not know. The promising young hussar (he rode well but clumsily) was thus left in the hands of civilians: the Grand Ducal secret might be discovered, so an assassin was sent to take off the young prince.

To make a long story short, on October 17th, 1829, Kaspar did not come to midday eating, but was found weltering in his gore, in the cellar of Daumer's house. Being offered refreshment in a cup, he bit out a piece of the porcelain and swallowed it. He had "an inconsiderable wound" on the forehead; to that extent the assassin had effected his purpose. Feuerbach thinks that the murderer had made a shot at Kaspar's throat with a razor, that Kaspar had ducked cleverly, and got it on the brow, and that the assassin believed his crime to be consummated, and fled, after uttering words in which Kaspar recognized the voice of his tutor, the possible albino. No albino or other suspicious character was observed. Herr Daumer, before this cruel outrage, had remarked, in Kaspar, "a highly regrettable tendency to dissimulation and untruthfulness," and, just before the attack, had told the pupil that he was a humbug. Kaspar left Daumer's house and stayed with various good people, being accompanied by a policeman in his walks. He was sent to school, and Feuerbach bitterly complains that he was compelled to study the Latin grammar, "and finally even Cæsar's Commentaries!" In his new homes Kaspar lied terribly, was angry when detected, and wounded himself—he said accidentally—with a pistol, after being reproached for shirking the Commentaries of Julius Cæsar, and for mendacity. He was very vain, very agreeable as long as no one

found fault with him, very lazy, and very sentimental.

In May, 1831, Lord Stanhope, who, since the attack on Kaspar in 1829, had been curious about him, came to Nuremberg, and "took up" the hero, with fantastic fondness. Tho he recognized Kaspar's mythopœic tendencies, he believed him to be the victim of some nefarious criminals, and offered a reward of 500 florins, anonymously, for information. It never was claimed.

Already had arisen a new theory, that Kaspar was the son of a Hungarian magnate, an idea at which the lad caught greedily. Later, Lord Stanhope averred, on oath, that inquiries made in Hungary proved Kaspar to be an impostor.

Lord Stanhope, tho he had relieved Nuremberg of Kaspar (November, 1831), and had made ample provision for him, was deeply skeptical about his narrative. The town of Nuremberg had already tried to shift the load of Kaspar onto the shoulders of the Bavarian Government. Lord Stanhope did not adopt him, but undertook to pay for his maintenance, and left him, in January, 1832, under the charge of a Dr. Meyer, at Anspach. He had a curator, and a guardian, and escaped from the Commentaries of Julius Cæsar into the genial society of Feuerbach. That jurist died in May, 1833 (poisoned, say the Kasparites), a new guardian was appointed, and Kaspar lived with Dr. Meyer. Finding him incurably untruthful, the doctor ceased to provoke him by comments on his inaccuracies, and Kaspar got a small clerkly place. With this he was much dissatisfied, for he, like Feuerbach, had expected Lord Stanhope to take him to England. On December 9th, 1833, Meyer was much provoked by Kaspar's inveterate falseness and said that he did not know how to face Lord Stanhope, who was expected to visit Anspach at Christmas. For some weeks Kaspar had been sulky, and there had been questions about a journal which he was supposed to keep, but would not show. He was now especially resentful. On two earlier occasions, after a scene with his tutor, Kaspar had been injured, once by the assassin, who cut his forehead; once by a pistol accident. On December 14th he rushed into Dr. Meyer's room, pointed to his side, and led Meyer to a place distant about five hundred yards from his house. So agitated was he that Meyer would go no further, especially as Kaspar would answer no questions. On their return, Kaspar said, "Went Court Garden—Man—had a knife—gave a bag—struck—I ran as I could—bag must lie there." Kaspar was found to have a narrow wound, "two inches and a half under the center of the left breast," clearly caused by a sharp double-edged weapon. In three or four days he died, the heart had been injured. He was able to depose, but not on oath, that on the morning of the 14th a man in a blouse (who had addressed him some days earlier) brought him a verbal message from the court gardener, asking him to come and view some clay from a newly bored well, where, in fact, no work was being done at this time. He found no one at the well, and went to the monument of the rather forgotten poet, Uz. Here a man came forward, gave him a bag, stabbed him, and fled. Of the man he gave discrepant descriptions. He became incoherent, and died.

There was snow lying, when Kaspar was stabbed, but there were no footmarks near the well, and elsewhere, only one man's track in the Hofgarten. Was that track Kaspar's? We are not told. No knife was found. Kaspar was left-handed, and Dr. Horlacher declared that the blow must have been dealt by a left-handed man. Lord Stanhope suggested that Kaspar himself had inflicted the wound by pressure, and that, after he had squeezed the point of the knife through his wadded coat, it had penetrated deeper than he had intended, a very probable hypothesis.

As for the bag which the assassin gave him, it was found, and Dr. Meyer said that it was very like a bag which he had seen in Kaspar's possession. It contained a note, folded, said Madame Meyer, as Kaspar folded his own notes. The writing was in pencil, in *Spiegelschrift*—that is, it had to be read in a mirror. Kaspar, on his deathbed, kept muttering incoherences about "what is written with lead, no one can read." The note contained vague phrases about coming from the Bavarian frontier.

After Kaspar's death the question of

" murder or suicide?" agitated Germany, and gave birth to a long succession of pamphlets. A wild woman, Countess Albersdorf (" *née* Lady Graham," says Miss Evans, who later calls her " Lady Caroline Albersdorff ") saw visions, dreamed dreams, and published nonsense. Other pamphlets came out, directed against the House of Baden. In 1870 an anonymous French pamphleteer offered the Baden romance, as from the papers of a Major von Hennenhofer, the villain in chief of the White Lady plot. Lord Stanhope was named as the ringleader in the attacks on Kaspar, both at Nuremberg and Anspach. In 1883 all the fables were revived in a pamphlet produced at Ratisbon, a mere hash of the libels of 1834, 1839, 1840 and 1870. Dr. Meyer was especially attacked. His sons defended his reputation by an action for libel on the dead, an action which German law permits. There was no defense, and the publisher was fined, and ordered to destroy all the copies. In 1892 the libels were repeated, by " Baron Alexander von Artin:" two documents of a palpably fraudulent character were added; the rest was the old stuff. The reader may find it in Miss Evans's " Kaspar Hauser" (1892). For example, Daumer knew a great deal. He even, in 1833, received an anonymous letter from Anspach containing the following statement: " Lord Daniel Alban Durteal, advocate of the Royal Court in London, said to me, 'I am firmly convinced that Kaspar Hauser was murdered. It was all done by bribery. Stanhope has no money, and lives by this affair.'" Daumer and Miss Evans appear to have seen nothing odd in relying on an anonymous letter about Lord Daniel Alban Durteal!

It is quite possible that Kaspar Hauser no more knew who he was than the valet of 1669-1703 knew why he was a prisoner. Nothing is certain, except that Kaspar was an hysterical humbug, whom people of sense suspected from the first, and whom believers in animal magnetism and homœopathy accepted as some great one, educated by his royal enemies in total darkness—to fit him for the military profession.

The fable about a Prince of Baden had not a single shred of evidence in its favor. It is true that the Grand Duchess was too ill to be permitted to see her dead baby, in 1812, but the baby's father, grandmother and aunt, with the ten court physicians, the nurses and others, must have seen it, in death, and it is too absurd to suppose, on no authority, that they were all parties to the White Lady's plot. Abject credulity, love of mystery, love of scandal, and political passions, produced the ludicrous mass of fables to which, as late as 1893, the Duchess of Cleveland thought it advisable to reply. In England it is quite safe to accuse a dead man of murder, or of what you please, as far as the Duchess understood the law of libel; so she had no legal remedy.

LONDON, ENGLAND.

Christ's Catechism

BY MINNIE FERRIS HAUENSTEIN

NOT by set form or length of weary words
Nor by the power of Rubric or of Creed
Did Christ propound the Question of all time
The fact supreme,—the soul's undying need.

Not 'neath the glory of Cathedral dome.
Nor by the reverent, silent altar-stair
Where wafts the wave of incense down the aisle—
God's temple is his boundless everywhere—

But with three trenchant, ever burning words
He searches deep the man who was to be
His pentecostal herald,—in his ears
He pours the threefold question, "Lov'st thou me?"

BUFFALO, N. Y.

Animal Individuality

BY JOHN BURROUGHS

CERTAIN of our nature writers lay great stress upon the individuality of animals, in many cases, as it seems to me, greatly exaggerating it.

If we mean by individuality differences in character and disposition, then is there a fair measure of individuality among the animals. No two animals are just alike, any more than any two trees are just alike. But if we mean the possession of striking original traits, unique powers and capacities, as among men, then is there very little. Animals do not differ in the degree that men differ. What one does all of its kind will sooner or later do. Anything you can learn of one bird or beast that is not true of every member of its species is unimportant. Otters as a class have their sliding places, foxes as a class are cunning, opossums as a class are stupid, weasels as a class are bloodthirsty, rabbits as a class are timid. In other words, all animals are true to their class the world over, and share in varying measure its capacities and limitations.

It is true all dogs do not kill sheep, but all wolves do. The dog is a descendant of a wild, wolfish ancestor, and its wild instincts occasionally crop out. Neither are all horses balky, or buckers, or kickers, or runaways. The horse is a domestic animal, and the devil gets into him, when we find him there, through man. I knew an old cow that would open a gate when my corn and cabbage were just on the other side of it, but she did it in a blind bovine way by bunting vaguely at the latch. When she hit it just right the gate swung open of its own weight.

I myself like to dwell upon what seem like individual differences in the manners and characters of the birds and the mammals. We all love the specific and the characteristic; but we are aware of these differences mainly because we have a few birds or mammals under observation and not the whole class. Some day we shall observe the same trait or habit in another of the same class. We see something in the eye or the face of a member of one's own family, and think it peculiar and original; then in the face of an Eskimo or a Cossack we see the same look.

The difference in habit and capacity among our brute neighbors is less than among men, in proportion as their powers are less. It may be laid down as a law that the higher we go in the scale of intelligence the wider the differences among individuals, and the lower we go the less these differences. Probably clams and oysters and snails do not differ among themselves at all appreciably. Insects do not seem to differ, for, notwithstanding the astonishing amount of intelligence insects seem to show, they are doubtless perfect automatons, as void of individuality as the leaves of a tree.

With the domestic animals—animals that have long been under the dominion of man and long subject to artificial conditions, as the dog, the cat, the horse, etc.—the variation in habit, capacity, disposition, is and should be much greater than it is among animals in a state of nature, otherwise we should never have had the various breeds of dogs, sheep, pigeons, swine, horses, poultry, etc. There are as yet no variety of turkeys (except in color) because the turkey has not long been under domestication. And among the wild animals there are constant variations, but not in so marked a degree. If we knew the birds and beasts as intimately as we know the members of our own family we should probably find no two exactly alike. People who have caged birds and caged squirrels find a great difference in them in temper and disposition.

Animal trainers find that the animals they deal with differ much in disposition and in capacity. Hunters find that the deer, or moose, or bears they pursue differ from each other in speed, in courage, in cunning, in size, in ferocity, etc. Roosevelt says that two wounded grizzlies or moose will often behave in opposite ways, but if one charges the hunter, be assured the time will come when others will charge him also.

Man introduces new and strange influences, makes new demands and thwarts instinct. Even the colors of ani-

mals change under his influence; white and black and a showy mixture of the two often take the place of the neutral grays and browns; and size and disposition vary quite as much. But I have never been able to see any marked difference between crows, or hawks, or squirrels, or rabbits, or woodchucks, or minks, or water fowl, or among the wild birds. In one locality an old, much hunted dog fox may be more than usually cunning and resourceful in baffling or eluding the hound; but other foxes in other localities, under like conditions, develop the same traits. They are exceptional only so far as man makes them so. Diversity in uniformity is nature's law. The uniformity is major, the diversity is minor. Note how this law holds with our smaller birds. Those vary most in their ways and habits that are most closely associated with man, as the robin, the song sparrow, the oriole. The robin varies greatly in its nesting habits, going from trees to walls and sheds and even upon the ground; but the song and song habits show great uniformity, except in the rare cases where it learns the song and call of some other bird. The English sparrow, shows great variation in its nesting habits and feeding habits also, and is very adaptive. Our song sparrows show marked variation in their songs, and but little variation in their nesting habits or feeding habits.

The oriole shows considerable individuality in song and call; but examine a thousand or two thousand nests and you will see but slight differences in them. But I am of opinion that orioles' nests of to-day show a marked departure from the nests of fifty or one hundred years ago; they seem to be rounder and shallower—less deep and gourd-shaped. This is certainly true if we take the nest Audubon painted as a type of the nest at that time. This is long and pear-shaped, with the entrance in the side of the neck near the top. Greater safety for the mother and the young would be secured by such a nest than by the more open and shallow one, and if the change I refer to has occurred, it would indicate that the danger from the natural enemies of the bird—crows and squirrels—is less now than formerly, which seems a reasonable supposition.

What I am aiming to say is that individuality among the lower animals in their wild state is not a matter to lay much stress upon, and that the study of any single specimen will not yield you anything of importance that a like study of others of its kind will not yield. There are no inventors, or discoverers, or originators among the animals. I have heard of but one wolf that was converted to Christianity, and he had the exceptional advantage of a sermon by St. Francis. It has been said by a writer of nature books that a coon will amputate its wounded foot and treat the stump in a rational way to allay the inflammation. If one coon will do this, then all coons will do it under like conditions. The same writer avers he has seen a woodcock with a broken leg mend the leg with a cast made of clay and dry grass. Then will all woodcocks with broken legs do the same thing. Exceptional intelligence of so extraordinary a character does not occur among the animals. If one fox has been known to catch crabs with his tail, then will all other foxes, under the stress of hunger, where crabs abound, fish with their tails. An animal will not do anything which necessity has not taught its progenitors to do. Necessity has taught certain

John Burroughs at "Slabsides"

fowls to eat sand and gravel, and they all do it. One of the most extraordinary things in bird life is the ruse of the female, among the ground builders, to decoy the intruder away from her nest by feigning lameness and paralysis, and thus offering herself as an easy prey. But this is not an individual trait. It is universal among certain ground nesters. Animal intelligence is inherited; it is a matter of experience or acquisition only in a very limited degree. A new problem suddenly presented, new conditions suddenly developed, and the animal has no power to cope with them.

John Burroughs at "Slabsides" (Another View)

When our "Modern School of Nature Study" arouses one's incredulity by its startling discoveries, such as that of a frog swallowing a live sparrow, or of a red squirrel with cheek pouches like a gopher, or of a porcupine making itself into a ball and rolling down a hill in the woods, or of a fox caught in a trap "playing possum," even feigning to be frozen stiff; or of a fox riding on a sheep's back to escape the hounds, and so forth, your incredulity is met with the statement that you are not to disbelieve these things simply because you yourself have not seen them; you have seen very little of what any one wild creature does; animals differ greatly, and one frog and one tumble bug and one woodcock may and will do things far beyond the reach of its class. It is against such absurd interpretation of the individuality of animals that I have been directing the foregoing remarks.

West Park, N. Y

Music, Art and the Drama

The Drama

IN considering the dramatic representations produced at New York this winter, by far the first place must be given to the opera as brought out at the Metropolitan Opera House. It is probably not extravagant to assert that the opera at New York this winter surpasses anything heretofore seen in this country, and is fully equal to any representation of opera which can be seen at the present time in any city in the world. "Parsifal," of course, has been the particular attraction, and its production here is certainly equal, and probably superior to, any which has previously occurred. As The Independent has already fully discussed this masterpiece of Wagner's, we content ourselves in this issue with merely reproducing a picture of Mr. Conried, the manager of the Metropolitan Opera House, and the much discussed scene from "Parsifal" showing the great Hall of the Grail. But the general merit of all the operas which have been produced this winter at the Metropolitan has been of the highest quality. The leading singers are among the best in the world. The precision, accuracy and expression of the orchestra and the chorus have been admirable, and the scenery and general accessories have never before been equalled in New York. The uniform high scale of excellence which the performances of such operas as "Aida,"

"Lohengrin," "Tannhauser" and others have attained merits unqualified praise, and lovers of music and of the opera have never had a greater opportunity to enjoy this very noble form of entertainment than has been afforded in New York this winter. The rates of admission ordinarily charged are inordinately high, but the scheme of comparatively reasonable prices on Saturday nights has been well maintained, and the operas given on those nights have been among the best. The fact that a considerable part of the lower portion of the house has been empty on Saturday nights is a striking illustration of the musical taste of those persons who attend on other evenings, and who abstain from going on Saturday nights because the price is comparatively cheap.

HEINRICH CONRIED

The general condition of the drama in New York this season, on the contrary, is, upon the whole, rather below the usual standard. The best play which has been produced this winter was Stephen Phillips's "Ulysses," a play which, in most respects, deserves high praise. It was based quite literally on the leading incidents of the beautiful old Homeric story. It was written by a true poet, and is colored throughout with the light of imagination and fancy. It was produced with magnificent scenery and accessories. The scene illustrating Ulysses' journey through Hades has rarely been equalled on the American stage. The acting was intelligent and effective. The only serious defect in the play was a lack, in places, of dramatic force and action, but it was upon the whole a play which any intelligent and cultivated person would thoroughly enjoy.

The best play now running in New York is "The Admirable Crichton," by J. M. Barrie. Its literary merit is fully equal to that of the best stories by this well-known author. The play is thoroughly clean and sweet. An odd, fantastic and fascinating humor plays in it all the time. The subject and the treatment is unusual, and the whole effect is charming. It is just the play to which to take the entire family. Mr. Gillette, who takes the leading part, acts admirably, as he always does, and all the minor parts are capitally taken, particularly two of the earl's daughters by Miss Sybil Carlisle and Miss Beatrice Irwin. The grace and lovely English voice of Miss Irwin are particularly winning in this part.

There has been also a number of plays of modern society which have been well presented and acted this winter by actors of skill and cleverness, but almost all of them are tainted more or less by the usual modern dramatic treatment of the relations of men and women in present society. One of the most interesting of these plays was "A Clean Slate," admirably acted by Miss Jessie Millward and the members of her company. The uniform excellence of all the actors in this play made the total effect very harmonious. "The Whitewashing of Julia" was another interesting play, in which Miss Fay Davis was notably winning and attractive. She is an actress of singular naturalness and charm. The play itself is written with much grace and wit.

Miss Henrietta Crosman, in "Sweet Kitty Bellairs," is an actress of quite unusual merit, and altho the play as written lacks charm and style, and the scenes are usually overcrowded with people, her individual part was admirably done. Her

Irish brogue in this play is delicious, and her acting generally of a high order. Miss Maude Adams, who is one of the most admirable actresses on the stage to-day, is not seen to much advantage in "The Pretty Sister of Jose." The play is frivolous and without dramatic movement, and the part is singularly unsuited to and unworthy of her. But each of the plays which we have mentioned, altho none of them is great, affords a pleasant evening entertainment. "Captain Barrington" is an American play, the scene being laid in the Revolution. It is not well written, and the play hangs upon the old device of the resemblance of twin brothers, making the mystery always glaringly obvious, but it is a clean play, with considerable action, and was upon the whole interesting. Mr. Richman, who takes the leading part, is, in this play, as always, intelligent and manly. The actor who represented General Washington acted with unusual dignity and grace, and in his make-up and bearing he very strikingly resembled the pictures of the original.

The play of "Candida" is written with some wit, and with an eccentricity which callow persons might mistake for originality, but is an essentially repulsive play. The character, who is supposed to be a poetic boy genius in love with Candida, and who appears like an anemic lout, who needs to be hazed, may have met the idea of the author, but it is difficult to imagine how any audience could be expected to believe that any healthy woman could ever have felt anything but repulsion for him, much less could ever have been in any danger of falling in love with him.

"Mother Goose" is a pretty good play to take children to on an afternoon. It is one of those gorgeous Drury Lane extravaganzas, intended for the Christmas holidays. The Goose family is very good, and Mother Goose herself is particularly anserine.

Victor Herbert

The report of Victor Herbert's resignation as Conductor of the Pittsburg Orchestra is formally incorrect. His

"Parsifal." Act I, Scene 2, The Great Hall of the Grail. (Copyright, 1903, by Pach Brothers)

VICTOR HERBERT

contract ends on March 19th, 1904, and he has notified the committee that he does not wish his name used as a possible candidate for Conductor after that date, as he has decided to remove to New York. No steps have as yet been taken toward choosing his successor.

This is the sixth year of Mr. Herbert's leadership in Pittsburg. He assumed charge at a crucial period in the history of the orchestra, at a time when vigorous measures were needed to counteract the disintegrating effect of Archer's leadership. With splendid energy and enthusiasm Mr. Herbert began a labor of reconstruction, and these pioneer qualities, combined with shrewd and sturdy musicianship, have won for the Pittsburg the third place among American orchestras. Mr. Herbert's achievement has been rendered possible by the co-operation of Mr. George H. Wilson, who was formerly in charge of the Chicago Orchestra, and is known as the ablest and most cultivated of orchestral managers. Mr. Wilson has raised his calling from the status of a business to that of an art.

Grand Opera in English

Henry Savage's Opera Company may not be mentioned in the same musical breath with the Metropolitan. But as an educational factor it is perhaps the most hopeful thing to-day in the music world with its low rates and its large repertoire.

The Savage Opera Company is better this season than ever before, and it enables many to become acquainted with the classics of opera literature who cannot afford to attend the Metropolitan performances. It is much more than the pianola as a means of popularizing music.

During a season of five weeks the following nine operas are presented: "Othello," "Carmen," "Faust," "Il Trovatore," "Tosca," "Lohengrin," "Tannhauser," "Aida" and "The Bohemian Girl." Schenck, an able conductor, atones in some part for an orchestra little above the average theater quality. The principals are of a surprisingly high grade, tho the chorus is mediocre. It is a pity from a purely musical standpoint that the singers of the Savage Company have taken such pains to attain a distinct enunciation, for it often becomes difficult to take their work seriously, and "Carmen" becomes as funny as "The Mikado."

The Savage Company will be seen outside of New York this year, and we heartily recommend it to all musically inclined.

The National Academy of Design

In its seventy-ninth year the Academy exhibition is no worse than usual. There had been talk of a change to be brought about in the value of the work this year and in the brilliancy of its social reception, by the solicitation of pictures painted by Americans living in Paris, and the substitution of the "Varnishing Day" for the "Private View" at the opening. But no change is in any way noticeable. Nobody varnished and the crowd was the usual one and bought the usual pictures at the first view; the expatriated artists are evidently not startlingly stronger than the men living at

home, or they are no better disposed toward Academy exhibitions.

Charles Warren Eaton received the Innes gold medal for a picture of "New England Pines," hardly as good as his "Old Mill at Crécy" in the moonlight, a less pretentious but better realized subpect. Hawthorne's "Girl in Green" deserved the first Hallgarten prize ($300); very beautifully handled in color and drawing, it had also more sentiment than this strong, but rather insensitive painter usually gets. In the case of the second Hallgarten prize ($200) would it not again have been better if "The Brothers" instead of "The Sisters," by Mrs. Kenyon Cox, had received the reward? The eyes in all Mrs. Cox's pictures are troublesome, but in this prize picture more than usually so. The third Hallgarten prize ($100) goes to a very young painter's sincere essay, "The Finale," by S. J. Woolf (a relative, by the way, of that Woolf who used to draw street children for *Life* with a tender humor not equaled by any one since his death), shows an aged man holding a violin. It is all better than the head, but that is carefully studied.

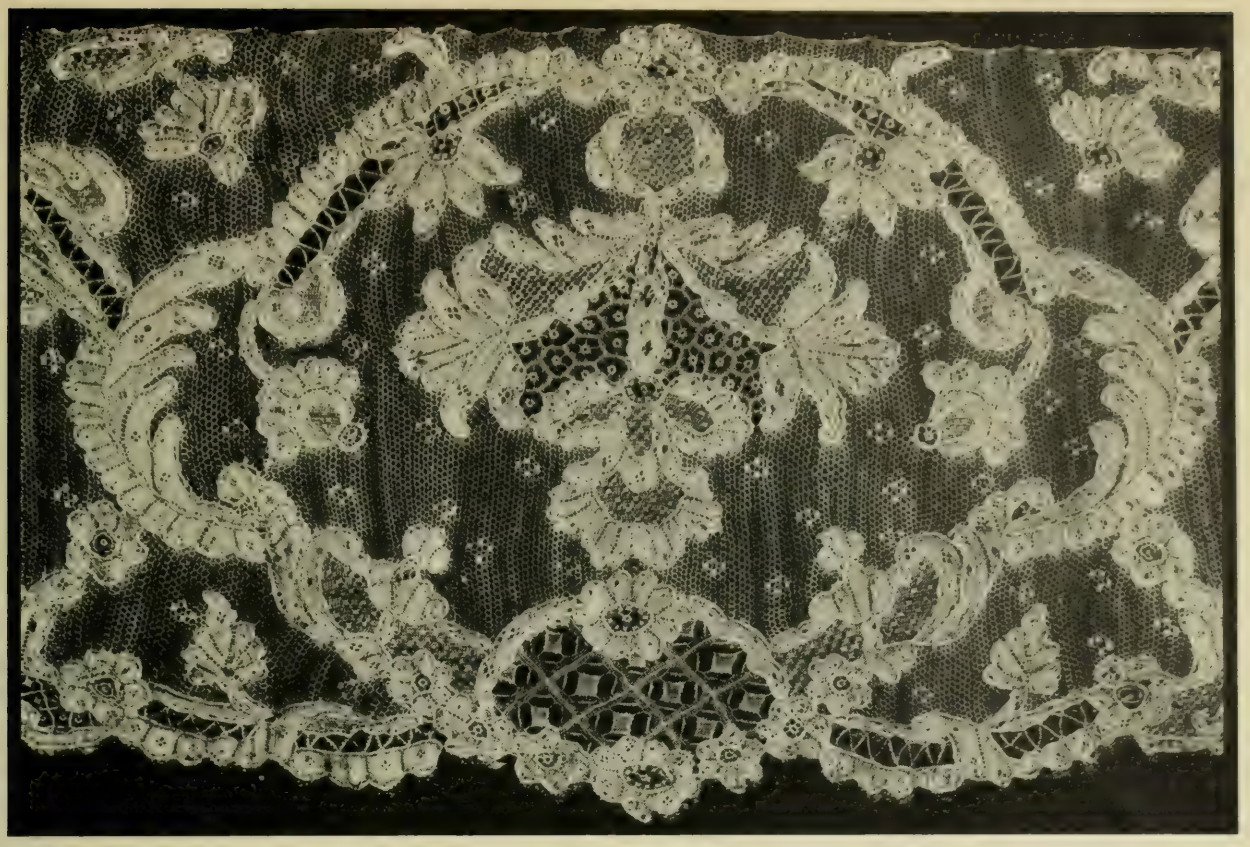
The Clark prize ($300) for best figure composition, was won by H. M. Walcott, for a picture of some children in a leafy arbor, intent upon the brightly lighted spot to the left of the center into which birds are hopping for bits held out to them. The colors are well handled in value and in the lighting, but one feels a striving for decorative quality not quite understood.

Robert Vonnoh won the Proctor prize ($200) for the best portrait in the show, with his very charmingly arranged and painted portrait of his wife, Bessie Potter Vonnoh.

The Little Statue of Ruskin. A Bronze by Gotzon Borglum

The one picture, however, of perfectly realized beauty in the exhibition is Mr. Alexander's "Quiet Hour," reproduced not long ago in one of the magazines.

Landscapes by Homer D. Martin



Among the events of the year for picture lovers there are none so satisfying as the occasional one-man exhibitions given by dealers or clubs. The Lotus Club is often responsible for the best of these, and in December gave its friends one of the most enjoyable exhibitions we are likely to have this season. Thirty canvases by Homer D. Martin were shown. Perhaps more than Inness's or Wyant's, Martin's landscapes have an absolute lack of the spectacular. There are never any violent contrasts of light and shadow, forced effects in the composition for the drama's sake; yet the dramatic quality is there. His wind or his wetness goes through every cubic foot of the represented portion of the earth in each picture. Because he is so unobtrusive in his methods, the first view of his work gives a momentary impression of inferiority to Inness and Wyant in scope, but these are landscapes to be watched for hours, new and deeper beauties appearing every moment as in Nature herself. The man's power of drawing is wonderful. That he knew his materials perfectly and has a wonderful sense of pictorial needs is apparent in such splendidly held together compositions as the "Low Tide Villerville" and the bit of French coast all grayish browns.

The largest of all the pictures shown, the superb "Westchester Hills," has the same supreme quality of oneness struggled for by all and reached by so few, and by them rarely. Martin's use of color is exquisite. Sometimes, as in "The Symphony," he has great fun with reds and cadmiums used with the very essence of delicacy, so that one hesitates to mention the names of such colors for fear of calling up a violence of color sensation that is never in his pictures.

No more beautiful picture in color can be imagined than the "Newport Neck," owned by the Lotus Club, with its sensitive sky of pinks and yellows and its distant purple sea and rough foreground of scaly rocks. But all of the Martins are individually lovely, in spite of the general impress of style upon them.

Grospoint de Venise (Late XVIth Century). In process of Construction. Boston Museum of Fine Arts. Bequest of J. W. Paige

Point d'Alençon (XVIIth Century). Boston Museum of Fine Arts. Bequest of J. W. Paige

The Lace Exhibit in Boston

An exhibit of rare and widespread interest was opened December 18th in the Boston Museum of Fine Arts, to last nearly all the winter.

It is perhaps a noteworthy feature of this exhibit that its managers refuse to point out to curious visitors the most expensive laces; they wisely enforce some other more worthy criterion upon those who would pass judgment.

The laces of earlier date are in the first eight or nine cases. They are curiously interesting, rather than pretty; they are of the Venetian "cut-work," or "drawn-work" school, and are the forerunners of the real needle-point. Such lace looks much like the Swedish work of to-day, which consists of drawn threads and cross-stitch patterns in white and dull colors. It was usually done over a "quintain" of linen cloth, pasted beneath and afterward cut away, and the pattern is—until the late sixteenth century—universally along conventional geometrical lines, such as we find in our grandmothers' samplers. Not only are flowers and vines represented, but horsemen, beasts and whole story-telling scenes. One large square of Venetian Burato of the sixteenth century represents Orpheus charming all kinds of geometrical beings with his geometrical lute,—rectilinier dragons, birds, trees and rocks. The next case contains the first example of a scroll-like pattern in flowing curved lines, and from now on the designs are increasingly graceful and romantic in conception. For some time still the principal stitch is darning, until the seventeenth century, when the button-hole stitch came into general use.

Case 10 contains some good pieces. One long strip running around three sides of the case has a most original and charming pattern and bears the Barberini arms at frequent intervals. Punto Tagliato a Fogliami is a lace of raised leaves and flowers, padded to various hights and giving a wonderful shaded effect in great contrast to the flat lace, such as Valenciennes. An interesting feature of this case is the unfinished piece of Punto Rosalina at the bottom, from which the pattern-parchment has not yet been cut. An excellent collection of silver and gold Ragusa guipure is shown near by, and the case of Burano finishes the line of Venetian point. Some pieces of the rarely seen Venetian bobbin (or pillow) lace are to be found in another

corner; all are small, but exquisite in design.

Many other Italian laces, too large for inclusion in the wall-frames, are displayed in the center cases—Genoese, Milanese, and mixed in with them some interesting Greek specimens.

Certainly, the exhibit is one to be commended to all who visit Boston this winter.

Recent Art Exhibitions

New York has already seen this season, one after another, nearly all the different phases of art a year's work has to show, altho two or three of the exhibitions most important in their generally higher quality have still to come. We have had the Water-Color Club's annual display, and it would have been as dull as usual except for the work of those three astonishing young women from Philadelphia or thereabouts, Jessie Wilcox Smith, Elizabeth Shippen Green and Violet Oakley. They seem to work together and to form a school by themselves, fearless as to color and with strong decorative as well as the required illustrative power. Miss Green's illustration for "Perdita's Lovers," the beautiful star-lit garden vista full of the romance only night holds, is a thrillingly delightful little picture. Miss Oakley has, perhaps, the more broadly decorative sense, and Miss Smith's children are human and lovable and interesting, as well as very often beautiful. Indeed, the child in the hands of all of these women is as successfully understood as he has been of recent years in literature.

The Woman's Art Club showed in the gallery of the National Art Club, eighty-five pictures that proved how well a large number of women have learned to paint and proved little else.

The water-color by Frank Russell Green, representing a well realized night, received the Morgan prize of $150 at the Salmagundi Club exhibition of Members' Work.

The Union League Club has had an excellent exhibition of forty-five pictures by Americans from the collection of Mr. Evans, including works by all the men we may call our best in landscape—Inness, Wyant, Martin, and after them, Bogert, Murphy, Ranger and others.

The exhibition of the National Sculpture Society, held also at the National Arts Club, necessarily showed only small things. The majority of the members of the society are occupied with the decorative sculpture for the St. Louis Exposition this year, and sent here only works of the statuette class, as a rule. The number of animal studies shown was notable—twenty-two out of some eighty-six works. A. P. Proctor, who devotes nearly all of his attention to brute creation, knows his field certainly, but among the ten statuettes shown here did not reach anything very big except possibly in the studies for the Monkey House in Bronx Park. The most interesting things shown were by men with foreign names. Gutzon Borglum showed a bronze group of horsemen of the frontier climbing along a rough mountain side that was a successful visualization of a scene of intense interest. His statuette of Ruskin, here reproduced, was a satisfying portrait of the poet, and his Nero was splendidly repulsive. By Paul Nocquet was a small group in bronze called "Hercule and Antei," that had a fine dashing action. The raging, forward sweep of the Hercule was cleverly helped by the lines of the dragging lion's skin. The more academic works by French, Niehaus, Lopez, Bush-Brown and others were generally commonplace. By Janet Scudder were some tiny medallions of great delicacy and charm. Her use of details of costume—often the modern and ugly—to fill space well, was masterful. Nothing could be more charming in composition than the exquisite relief portrait of Margaretta McVeagh, with the uplifted glance and the hand touching the chain about her neck, or the relief of the woman holding the little dog. By another woman—Anna V. Hyatt—was an interesting bit of genre—a pair of stubby farm horses out in a wild snow storm with blankets half blown off and an appealingly cold look. It was interesting to note that Lucy Perkins, who produces that interesting modelled pottery shown at Taft and Belnap's Arts and Crafts Shop, is also clever in handling the figure. The head of her here had a unique quality comparable to that in the painting of Dewing, and the bronze snake-bound girl was excellent.

Literature

Man's Place in the Universe

THE veteran naturalist, Dr. A. R. Wallace, as our readers doubtless remember, published last year in THE INDEPENDENT, and also in the *Fortnightly Review,* a most interesting and suggestive article in which he attempted to show that the earth alone is the abode of intelligent beings, and that the human race is therefore unique in the universe. The article excited a great deal of discussion and criticism, and in the handsome volume * before us the author develops at length his argument and marshals the consideration upon which it is founded, making, however, some slight modifications of his original positions in deference to crticism.

It is obvious, and admitted, that the motive which has led him to this train of reasoning is the same which actuated Whewell in his famous work on "The Plurality of Worlds"—viz., the feeling that the doctrines of the Incarnation and Redemption accepted by the Christian Church demand the belief that the human race is thus unique.

It may be said at the outset that this sentiment seems to have no real logical force. If, in fact, there be "other worlds than ours," why is it hard to believe that the same benevolent Deity who has provided for our redemption would in some wise and effective way interpose in their behalf if the entrance of sin should call for help. The acceptance of one such wonderful miracle ought to make it easier rather than more difficult to admit the possibility of others more or less like it under similar conditions.

But one is reminded of our Saviour's words, "What is that to thee? follow thou me."

The propositions which Dr. Wallace endeavors to establish in support of his main conclusion are summarized by him as follows:

(1) "That the [our] stellar universe forms one connected whole; and tho of enormous extent is yet finite, and its extent [perhaps] determinable."

(2) "That the solar system is situated [approximately] in the plane of the Milky Way, and not far removed from the center of that plane. The earth is therefore nearly in the center of the [our] stellar universe."

(3) "That this universe consists throughout of the same kind of matter, and is [probably] subjected to the same physical and chemical laws."

The words in brackets have been inserted by the present writer. By "universe" the author means simply the assemblage of stars and nebulæ, visible or otherwise, recognizable by our means of observation. He distinctly admits the possible, even probable, existence of other universes quite beyond our ken.

In (2) the words "approximately," "not far" and "nearly," are to be interpreted with reference to the dimensions of the universe.

Dr. Wallace would not deny that, for all we know, our system may be many "light-years" distant from the exact center of the universe, possibly as much as a hundred light-years, the light-year being the distance which light travels in a year. This is no less than sixty-three thousand times the distance of the earth from the sun, or nearly six thousand millions of millions of miles (586,000,000,000,000 miles). In his original article he insisted upon a much more exact centering of the solar system, and he now makes the change as a concession to the practically unanimous criticism of astronomers.

It may be at once admitted that this conclusion as to the position of the sun is irrefutable, in the sense that it cannot be disproved from the facts now known; we have no absolute knowledge that the sun is not so situated—no unquestionable data are inconsistent with it.

And yet our data are capable of quite a different interpretation. It is certain that interstellar space is not perfectly transparent, but is inhabited by countless my-

* MAN'S PLACE IN NATURE. *By Alfred R. Wallace.* New York: McClure, Phillips & Co. $2.50 net.

riads of meteoric particles, of which not less than twenty millions daily fall upon the earth in the form of shooting stars. There are also unknown numbers of larger masses; and of immense dark stars also, a few of which have already been detected by their effects upon their neighbors. It is a question whether they do not actually outnumber the stars that shine. The space around us is therefore "hazy," so to speak, and our telescopic vision can only penetrate, to a limited distance, about the same in all directions. However far the "universe" may extend beyond our power of seeing, we must be not far from the middle of that part of it within our sight.

But passing over this, we know that within a hundred light-years' distance from the exact center of the finite universe accepted by the author there must be hundreds, and probably thousands, of other stars as "favorably situated" as our sun. Not one of those whose parallax we have thus far been able to measure is more than fifty light-years distant from the sun.

Nor are the special advantages which the author insists upon as connected with a central position in the universe, of such importance as he seems to imagine. So far as can be made out at present, the influences received from the stars, through their light and heat or otherwise, amount to practically nothing. We should be as well off anywhere else, unless perhaps in, or close to, the Milky Way, or too near some great blazing star.

The author brings out very clearly the unquestionable fact that upon no one of the planets of our system but the earth (Mars possibly, tho not probably, excepted) could life as we know it here exist, and he exhibits in a masterly manner the wonderful process of evolution which has culminated in the human race—a process which he argues could have been possible only upon a globe like our earth, similarly situated in a planetary system like our own, and that system nearly central in its universe.

This may, perhaps, be, in the main, admitted. But it is by no means certain that there may not be many such globes and systems. It is true that no planetary attendants of the stars have yet been discovered; but it is easy to show that if they exist, it would require something far beyond our present telescopic power to make them visible; it is more natural to suppose that such systems are numerous than that there is only one.

Dr. Wallace dwells upon the unquestionable and important fact that so far as we can ascertain (and our knowledge has gained an extensive range within the past half century), the same substances and physical laws appear to prevail throughout the entire universe. This gives a certain plausibility to the assumption that intelligent life could originate only under conditions like those under which our own humanity has come to its high estate.

And yet this is far from certain. We do not know, and it is not safe to assume, that embodied consciousness, intelligence, the moral sense—"mind and soul," in short—can exist only in a physical organization similar to our own. "Without phosphorus no thought," is at least a doubtful dictum. For aught we know there may be in space countless races of intelligent moral beings peopling unseen worlds. We do not assert that it is, or is not, probable; opinions may differ as to that, and very likely it will be debated no less vigorously than if there were some certain knowledge on which opinion could logically be founded.

To sum up the whole matter—the arguments for and against the plurality of worlds and of races of intelligent beings are at present simply from ignorance to ignorance. The question is substantially in the same condition as that relating to the inhabitants of Mars, as to which Professor Newcomb sententiously says: "The reader knows just as much about the subject as I do, and that is nothing at all." We can only surmise and imagine. Whether the future will bring knowledge we cannot tell.

But while the author fails in our judgment to establish his conclusion, the book is well worth reading and full of suggestion and information.

A word of caution is, however, needed as to the accuracy of its astronomical statements. There are numerous inaccuracies and inconsistencies, of no special importance in relation to the argument, but sufficient to render it unsafe for the reader to accept the work as in any sense an astronomical authority.

The American Revolution

From the issuance of Part I of this history of the American Revolution * it was plain that a welcome voice had been raised to reproclaim an old truth that—in this country, at least—had long been overlooked. Even before our independence had been achieved it had become almost an article of faith with Americans that our Revolution had been from the start a fight to secure our separation from Great Britain. Instead of which it was, at the first, but a struggle to retain the rights which they had possessed in their old home, and which liberty-loving Englishmen had long fought for and gradually gained at heavy cost to themselves for the enjoyment of their posterity everywhere. If England's colonies could not retain an Englishman's rights without becoming independent of her control, then, independent we must be. This was the issue that was thrust upon us rather than sought. It is probably within the truth to state that as lately as 1774 not one-tenth of the adult population of the "Old Thirteen" either expected or desired a separation. Of that part of the population of Great Britain and Ireland which possessed sufficient intelligence to look into the subject, the proportion which desired to deprive the Colonists of any of their rights as Englishmen were about the same.

In the view of King George III and the ministry of his choice even home-born subjects possessed few rights which the royal authority was under obligations to regard, while the Colonists had still fewer claims to royal consideration. In fact, the war of our Revolution was but a repetition at a distance, both of time and of space, of the last civil war in England. The position of George the Third was virtually that of Charles the First, while the revolting Colonies occupied that of the Parliament. As the struggle proceeded the bitterness of American feeling became intensified, and by the time that peace was declared it appeared to all parties that independence had been the original cause for which the war had been begun.

Lexington and Bunker Hill had been proclaimed in England as victories of the Crown over armed rebels; but there were many persons who did not accept them as such. A young man who was about to accept office under Lord North dared to tell the latter that—"If we have eight more such victories there will be nobody left to bring the news of them."

The intelligence that a revolution was in actual progress in the Colonies was not more unexpected by the English nation than it was unwelcome, and that by both of the great political parties: "The most caustic remarks about the folly of alienating the Americans and the impossibility of subduing them came from the pen, not of any Whig or Wilkite, but of David Hume," whom our author justly calls "a stronger Tory than George the Third." The Whigs, almost without exception, sadly or resentfully acknowledged England's responsibility for the event which they viewed as the common calamity of the entire British race. "Those who wish well to the whole," wrote Horace Walpole, "can have but one cheerful moment, which is that of peace,—a moment that seems at a great distance." John Wesley, who had preached and traveled here and knew the country and its people, writing to Lord North two days before Bunker Hill, gave expression to the sentiments of the best people in England when he said:

> "I cannot avoid thinking, if I think at all, that an oppressed people has asked nothing more than their legal rights in the most modest and inoffensive manner that the nature of the thing would allow, but, waiving all considerations of right or wrong, I ask,—is it common sense to use force toward the Americans? These men will not be frightened. They are as strong men as you. They are as valiant as you, if not more abundantly valiant, for they are, one and all, enthusiasts for liberty."

The last clause was not quite true, for there was still a very large party in the Colonies whose members were still so loyal to the old traditions that they were willing to suffer wrong rather than to do what seemed to them the greater wrong of throwing off allegiance to the Crown. The liberty-enthusiasts were perhaps as numerous in England as here, but there it was a lamentable fact that "the great middle class" was there "to

* The American Revolution. *By the Right Honorable Sir George Otto Trevelyan, Bart.* Part II. Vol. 2. Longmans, Green & Co. $5.00 net.

all intents and purposes excluded from the higher administration of the country." Never since then has an English king or ministry so overridden the will of the people as expressed through the press and Parliament. Had there been a larger proportion of men of a high intellectual order in the temporarily dominant party probably the voice of the people would have been heard, for that voice spake with no uncertain sound from 1775 to 1783, not only through the mouths of such masters of debate as Burke and Fox, but also in the petitions of manufacturers and merchants, of laborers and country gentlemen, of professional men and mechanics, and of the intensely practical tradesmen of London. George III was not one of the worst monarchs in history; in fact, he was a far better man than some who have made much better rulers, but he was narrow, obstinate and vain, a combination prone to blunders, and he had not the moral grandeur required to retrieve a wrong step, once taken, by reversing his action.

In reading these admirably written volumes one is tempted on every page to mark something for quotation, so well grouped and contrasted are the facts, so clearly etched is every character and circumstance, so keen and polished the wit which enlivens every paragraph.

Not even in the works of our own most appreciative historians are to be found more generous tributes to the character and great abilities of Washington than are written here. The entire chapter headed "Washington's New York Army," especially that part of it which describes "The American Soldier," is written with a fairness and discrimination that are worthy of wide imitation among historians.

A defect which must be felt by American readers is that many events which appear to us to be of great importance are too slightly noticed. To Washington's Long Island and New York campaigns and to the victories of Trenton and Princeton, both space and pains have been freely given and every praise should be awarded to the chapters devoted to them. On the other hand, Saratoga, Yorktown, and the struggle in the Carolinas have received too scant attention.

Laura Bridgman

THE publication of Miss Keller's autobiography last spring seems to have reawakened a very general interest in the education of the deaf, dumb and blind, not the least important result of which is the appearance of the first complete and authentic account of Dr. Howe's pupil, Laura Bridgman, prepared by his daughters from his own notes and reports and from Laura's letters and journals.* The story they have to tell is, on the whole, less interesting than Miss Keller's; but it is, perhaps, more significant as a record of the first successful experiment of the kind ever attempted, and then, too, it does restore Laura to her proper priority of interest.

Like Miss Keller, she was not born blind, but lost her sight and hearing when she was about two years old, in consequence of a very severe attack of scarlet fever. Of the earlier and normal portion of her life, however, she seems to have retained little or nothing, when six years afterward she fell under Dr. Howe's notice and began her education with the acquirement of language. From this time until her death, in 1889, at the age of sixty, her existence is merged with that of the Perkins Institute, of which she remained an inmate during the rest of her life. In order to appreciate her master's success, it must be remembered that he had no precedents—nothing of any kind to aid him in a task which was considered impossible by many. His first attempt to reach his pupil's mind was made with words of raised letters, attached to some simple object, such as a book or a knife—the words being resolved into their component characters as soon as she became familiar with them. The manual alphabet was used only in the second instance. She learned eagerly and with diligence, but never very readily, it would seem. She was in general a docile, amiable child—in spite of an occasional outbreak of temper due to her nervous temperament and perhaps to an impatience of her limitations—but rather matter of fact and unspeculative, except in matters of religion, for which she showed a remarkable interest.

* LAURA BRIDGMAN. *By Maude Howe and Florence Howe Hall.* Boston: Little, Brown & Co.

What impresses one particularly about Miss Keller, is her power of abstraction and her decided intellectual turn. With very inadequate substitutes for the usual symbols of language, she appears to perform all the complicated algebraic processes of thought with astonishing ease and correctness. It is curious to speculate what first hand impressions of life are possible to a person so situated—a rather wide range of tactile sensations, some few vague tastes and smells, and a dull consciousness of the bodily machine. And yet meager as these elements are when compared with sights and sounds, they are capable, as Miss Keller has shown, of being worked up into a lively and original illusion of life, particularly when compounded with other matters of indirect knowledge. But Laura Bridgman seems to have wrought very little change on the data furnished by her sensations or even on the information given her by her teachers. She never read very much or very easily—perhaps it is for this reason that even at thirty she had no very assured control of written language; and tho she had unusual opportunities of conversing with distinguished people, her mind retained to the last something of its childish immaturity. The void left by her lack of intellectual interests, she filled up with handiwork and with domestic concerns. And yet, tho there is a pathetic ache of emptiness about her story, as one reads it here, she did succeed, in spite of her terrible infirmity, in living a seemly, cheerful life—deft-handed, busy and, in her degree, useful.

The Literary Guillotine. New York: John Lane, $1.00 net.

A keen, strong satire on a number of present-day authors. A literary court, authorized by the legislature, is convened to try the most flagrant offenders against the cause of letters. Mark Twain, Oliver Herford and the anonymous author are the judges, and Charles Battell Loomis is the prosecuting officer. Among those tried are Richard Harding Davis, Henry James, Mary Baker Eddy, John Kendrick Bangs, Hall Caine, Marie Corelli, a group of historical novelists and another group of poets. The weight of testimony is all against the accused, but convictions, for one cause or another, are hard to obtain. All of the cases are not properly prosecutions; that, for instance, in which Mr. James and Mrs. Eddy are concerned is a suit for infringement of patent. It appears that Mr. James considers his right to the use of the obscure sentence as exclusive and that he resents its employment by Mrs. Eddy. But the court holds that there is no infringement; that Mrs. Eddy has a constructive, if not actual, priority in its use, and that, besides, the two varieties of obscurity are fundamentally distinct. That of Mr. James, it is held, while unsolvable in detail, is at least vaguely understandable in the mass; while that of the prophetess is wholly incomprehensible in the mass, tho partially comprehensible when examined sentence by sentence. It would be impolitic to say wherein the author has done his best work, for many of his hits touch the quick in a way to make a sensitive writer squirm, and we do not want to add to the pain. Altogether, tho the account drags heavily at times, and some of the jokes and puns are wretched, the skit is a merry and witty piece of work. The purely satirical parts are keen and often brilliant.

In Happy Hollow. By Max Adeler. Philadelphia: Henry Coates & Co.

It is by no means unamusing, this cleverly told little tale of Happy Hollow and its denizens. One might almost conceive it an American "Cranford" *if* one could conceive "Cranford" translated into terms of broad burlesque with an American Mr. and Mrs. Micawber (also broadly burlesqued) presiding over it instead of the thoroughly legitimate and exquisitely artistic Miss Matty and, say, Captain Brown. Pompous and grandiloquent Colonel and Mrs. Bantam, Mrs. Purvis Hyde—Happy Hollow's Mrs. Jamieson—A. J. Pelican—all are entertaining in their way, and tho it is sometimes a little confusing to follow the author in his lightning changes from "straight work" to farce, one manages to extract enjoyment from his story and particularly his piquant way of telling it, as also his sly thrusts at institutions and conditions that exist in Happy Hollow—and elsewhere.

Memoirs of a Child. By Annie Steger Winston. New York: Longmans, Green & Co., $1.00 net.

This little volume is an epic of fairy thought and action conceived out of the very heart of childhood. Nothing comparable to it has been published since Pierre Loti's account of his own little boyhood appeared several years ago. The author has preserved without affectation or weakening sentimentality the angle of vision from which a very little girl viewed the phenomena of life and nature about her. And she has accomplished her task so delicately, with such minute wit, that the result is not so much a sweet fiction as it is an authentic contribution to literature dealing with the more or less esoteric mind of a child.

Literary Notes

THOMAS Y. CROWELL & Co., New York, in the "Pembroke Shakespeare," republish the original text of the First Folio of 1623 in a set of twelve volumes in a neat box (cloth, $9). The volumes are very light and handy, and the notes reduced to the indispensable minimum. This edition is for most students as good as a *facsimile* folio, and will also be enjoyed by many general readers, who enjoy the seventeenth century flavor of such a text.

....The "List of Books on the Philippine Islands," published by the Library of Congress, is a good piece of work in bibliography, and will be very useful to those who have had to find their way through the labyrinth of public documents. Maps are indexed, and there is a list of the articles in the more important magazines, including over a hunderd titles from THE INDEPENDENT. The leaves are uncut, altho there can be no possible reason for this imposition on the reader's time in the case of a bound reference book.

....The Rev. J. L. Jenkins, of Jamaica Plain, Mass., writes us that while W. C. Bryant's college poem, printed in our issue of January 7th, has not yet been gathered into the collections of Bryant's Poems, General Wilson is mistaken in supposing that it had not been previously published. It was printed in *The Christian Union* of June 25th, 1891, from a copy which Mr. Jenkins found among the papers of his father, who was in college with Mr. Bryant, and to which was attached the statement: "Written by W. C. Bryant, a member of the Sophomore class in Williams College."

Pebbles

Vas it alone dot Dido died oh,
Hemmed 'round by cruel fire?
Ach nein, it vas not at all so,
She had her funeral py her.
—*Yale Record.*

....The child was extremely ill. Anybody could see that. "What has she been eating?" asked the doctor. "She is just home from a little children's party, where the refreshments were chicken sandwiches, fruit cake, candied cherries, nuts, coffee, chocolate creams and lobster salad," said mamma. Doctor looked perplexed. "Anything else?" he asked. Mamma thought a moment. "Oh, yes! fruit ices," she said. "Ah!" exclaimed the doctor at once. "Doubtless the water with which the ices were made was not thoroughly sterilized." He shook his head.—*Life.*

Speak kindly to the millionaire;
Perhaps he does his best,
Don't try to drive him to despair
With rude, unfeeling jest.
Don't laugh at portraits which display
His face with common leer,
And when he gives his wealth away
Don't take it with a sneer.

Speak kindly to the millionaire,
He has a right to live,
And feel the sun and breathe the air
And keep his coin or give.
You may be rich yourself, you see,
Before your life is through
Speak kindly, and remember he
Is human, just like you.
—*Washington Star.*

"When the English tongue we speak
Why is 'break' not rhymed with 'freak?'
Will you tell me why it's true
We say 'sew,' but likewise 'few;'
And the maker of a verse
Cannot cap his 'horse' with 'worse?'
'Beard' sounds not the same as 'heard;'
'Cord' is different from 'word;'
'Cow' is cow, but 'low' is low;
'Shoe' is never rhymed with 'foe.'
Think of 'hose' and 'dose' and 'lose;'
And of 'goose'—and yet of 'choose.'
Think of 'comb' and 'tomb' and 'bomb;'
'Doll' and 'roll;' and 'home' and 'some.'
And since 'pay' is rhymed with 'say,'
Why not 'paid' with 'said,' I pray?
We have 'blood' and 'food' and 'good;'
'Mould' is not pronounced like 'could.'
Wherefore 'done,' but 'gone' and 'lone?'
Is there any reason known?
And, in short, it seems to me
Sound and letters disagree."
—*Bangaler's Magazine.*

Editorials

A Model Arbitration Treaty

In view of the notable arbitration conference held this week in Washington, we discussed in our last issue what provisions a model arbitration treaty should contain. Altho the action of the conference will be taken after we go to press, the subject is so timely and important that we venture to give in this issue the full text of such a treaty as would perhaps contain the most important provisions to make it serve as the basis of arbitration between England and the United States and be a possible model for future treaties between other nations. The points which seem to us of special importance to incorporate in such a proposed treaty are these:

1. That The Hague Court shall acquire jurisdiction in those questions not reserved for trial by war.
2. That either party to such a controversy shall be able to set the wheels of the court in motion.
3. That the court itself shall have authority to develop a suitable system of procedure.
4. That in the questions reserved for war, the appeal to arms shall be made only after the decision of the court.
5. That there may be no danger of a failure to constitute a court by the selection of judges for the trial of any particular controversy.
6. That The Hague Treaty shall remain in force as long as the arbitration agreement.

The articles of such a suggested treaty are as follows:

Article I.—All differences which now exist, or which may hereafter exist, between the high contracting parties shall be determined by arbitration, under the treaty of The Hague. But nothing herein shall prevent entire freedom of action by either party in case of dispute or conflict between either of the parties hereto and a third Power.

The proviso of Article I is to make sure that nothing in this treaty shall impair our insistence on the Monroe Doctrine. Even if the Doctrine were violated by England we would be free to act against England, because a Latin American nation would be affected. Also, in case of war between England and any third Power, we should be free to act according to our interest.

Article II.—In cases involving the independence, autonomy or constitution of a nation, there may be an appeal to arms after the decision by the Court of Arbitration, but only by the nation whose independence, autonomy or constitution is questioned.

This Article places questions of fact and law on the same footing as questions of fact under Articles 9 to 14 of The Hague Treaty (which provides for a commission of inquiry for questions of fact and allows an appeal to arms after the decision), with this difference, that appeal to arms is limited to the nation whose independence, autonomy or constitution is questioned.

Article III.—The right of appeal to arms after a decision by the court shall not be allowed to any nation in any case after it has allowed one previous decision of the court to stand in a case of the same character, nor after the expiration of six months from the rendition of the decision.

This Article is needed only in case questions other than independence, autonomy or constitution are reserved for trial by war. The provision made herein will let custom have due weight, and custom is the great law-maker.

Article IV.—Notice of what shall be contraband of war in the conflict which is to come must be attached to an appeal to arms from a decision of the court. And all alleged violations of the law of nations or the rules of war accepted by both parties, in any conflict upon appeal from a decision by the court, shall be passed upon by a Court of Arbitration constituted according to the treaty of The Hague and the terms of this treaty.

When war breaks out under present conditions the nations concerned make public their claim as to what shall constitute contrabrand of war, but this Article would tend to minimize the trouble growing out of this question. In the old trials by battle between citizens of England, which were lawful as late as 1819, the court named the weapons, the time, place and length of the encounter.

International wager of battle between nations that are all the while within the United Nations may, some day, be regulated as to weapons, scene of action, length of duration, etc.; but it seems sufficient at present to provide that the court shall pass upon any violation of recognized duties which occurred in the stress of war.

Article V.—Either party to a controversy may deliver to the other party or parties a statement of its contention, and is entitled to a judgment according to the same, to be entered by the clerk, unless it receives a counter statement in a reasonable time. Upon application and proof of delivery of such statement of the case, the clerk of the court shall designate what would be a reasonable time for delivery of counter statement.

A judgment by default may be set aside by the clerk for reasonable cause.

Upon issue joined either party shall be entitled to apply for an order of the court designating the time, place and manner of taking evidence and fixing a time for the trial of the case.

When this application is made, the members of the court for the trial of the case shall be selected. And it shall be proper for them to decide and announce to the contending parties the reasonable rules of procedure to be followed in the trial of the cause.

Rules of procedure once anounced and followed shall be considered as constituting a part of the procedure of Permanent Court of Arbitration, but they may be changed by the court specially constituted to try any question upon the application of any party at the first session of a court after its first constitution.

This Article enables either party to set the wheels of justice in motion without the active consent of the other party in a controversy which it has been agreed by this treaty shall be determined by arbitration.

It also enables the court to develop such rules of procedure as will make it most useful.

Article VI.—If a court shall not be constituted by the method provided in the treaty of The Hague, the clerk of the court shall summon by lot a sufficient number of the members of the highest court of the nations signatory of the treaty of The Hague, not of the two high contracting parties, from whom the court shall be completed by the methods now in use in selecting a jury. The court shall determine how many peremptory challenges each party may make, also what shall be considered good cause for challenge. And any number of challenges may be made for cause.

In making the members of the highest court of the nations eligible for duty on the international court, it is intended that only those who are actively judging in their own nation shall be eligible to judge between nations.

This Article will insure the constitution of a court, in case the method of selection provided in the treaty of The Hague fails to accomplish this.

Article VII.—The high contracting parties agree that neither shall denounce the treaty of The Hague without the consent of the other, while this present treaty remains operative. And the Permanent Court of Arbitration provided for by the treaty of The Hague shall have and exercise the jurisdiction created by this present treaty until the present treaty is denounced, even tho all the other signatory Powers may have previously denounced the treaty of The Hague.

And in order to make this Article of this present treaty effectual, the high contracting parties agree, so long as this present treaty remains in force, to keep their members of the Permanent Court of Arbitration duly appointed as provided in said treaty of The Hague.

This Article is to provide against untimely termination of this treaty by a denunciation of the treaty of The Hague by either of the contracting parties, or by the other Powers, which is now allowed upon one year's notice.

Article VIII.—This treaty shall continue in force for three years after it is denounced by either of the parties hereto.

The idea in making the treaty run three years after denunciation is to enable the parties to adjust themselves to the altered condition following the termination of the treaty; for instance, by making changes in their army and navy. Three years would give the party opposed to denouncing the treaty an opportunity to carry the country for continuing the treaty before it actually terminated.

Article IX.—The number of judges to be selected as herein provided for the trial of any controversy shall be five, unless otherwise agreed by the parties, and decision shall be by a majority of the judges.

The Articles of Confederation of the United States (1776-89) left the Congress free to fix the number of judges at seven or nine when it was necessary to constitute a court for the trial of a question between two States. It seems better

to fix the number definitely, and five will probably be found better than seven or any larger number—five being enough for counsel and not enough for confusion.

Article X.—The president of the tribunal or court constituted by virtue of this treaty shall be designated by the court after it is fully constitued.

The court constituted at The Hague to try the Pious Fund Case between Mexico and the United States recommended that subsequent courts constituted under The Hague Treaty should be left free to elect their own chief justice, instead of being compelled to have the umpire preside. They were of opinion that some eminently desirable jurists might be glad to serve as a member of the court, but yet unwilling to become its president.

Article XI.—Unless otherwise agreed by the parties, English shall be the language used in the trial of questions arbitrated under this treaty.

In a treaty between England and the United States English would naturally be the language of the arbitration court, and yet the members of the court selected for the trial of the question might be more conversant with some other language. In such a case the parties might well agree to the use of a language more convenient for the court and in the appointment of agents and counsel select men versed in the language to be used in the proceedings.

New Problems in the South

The holiday meetings at New Orleans of the American Economic Association and the American Historical Association set going a lively thinking that will affect public opinion, North and South. At no other time have so many men who by training and occupation are qualified to reflect upon industrial and political problems observed Southern conditions at first hand. The Southern people, on their part, and their newspapers, were eager to obtain the impressions of these Northern visitors. The South felt the quickening influence of the strong intellectual movement that these associations stand for, and the Northern men came home with a sense of the reality and the difficulty of Southern problems that never could have been obtained through hearsay evidence.

The chief fact forced upon the attention of any Northern visitor to the South to-day is that the immediate problems of that section are not the ones that are most talked about. The political differences of the North and the South are becoming historical. To say that the race question also is taking on an entirely new phase is to express in moderate terms a fact of the most serious reality. The South is unalterably determined to deny social equality to the negro race at any and every cost; but while devoting its best thought to devising all manner of political and ceremonial means to accomplish this end, the Southern people, quite unconsciously, are entering upon a new stage of social evolution that will settle the question of social equality in an incidental way. The new problems of the South are economic. The new economic development is about to put a pressure upon the negro race far more severe than any it has heretofore experienced. No intelligent student of industrial progress can fail to see that a considerable proportion of the black race in the South is doomed. Its inevitable fate is pauperism and crime. Under the new conditions that portion of the race alone will survive which is capable of mastering new industrial methods and of subjecting itself to the requirements of systematic, intelligent, faithful economic activity.

Like every section of the country, the South is witnessing the concentration of capital. The day of the small railroad is gone by. The day of the small cotton mill, of the small sugar plantation and the small sugar mill has long gone by. The new captains of industry are men of the resolute sort, who propose to keep abreast of the times, and to enter into the fiercest competition with their rivals in the Northern States and in foreign lands. To a great extent the undertakers of the new Southern enterprises are Northern men. To a very great extent the capital which they control is

Northern capital. And herein lies a menace to the negro race. The Southern employer has always been lenient toward the negro's industrial faults. He has borne with him with a degree of patience that has often approached the border line of indifference. Not so the Northern capitalist. When the Northern business man finds that negro labor is inefficient and costly he does not hesitate—not for ten minutes—to turn the black man adrift and to give the job to a white competitor.

As one journeys Southward through the Carolinas and into Georgia, he sees on every hand the evidences of a new and energetic life. Cotton manufacturing towns are springing up on all the lines of railway. Well constructed brick mills are surrounded by neat and atractively designed cottages for the work people. These work people are whites, largely drawn from the hardy population of the Western uplands, and from the North and the West. In the sugar belt of Louisiana one sees hundreds of Sicilians working in the mills and on the plantations. The superintendent of one of the largest mills in the South says that he is displacing negro labor as fast as he can obtain white, and he exults in the fact that Italians are coming into Louisiana at the rate of ten to twelve thousand a year. In the best hotels one sees negro help only in the dining room. Your room is cared for by a white maid, and your boots are blacked by a white man.

Three great industrial movements now under full headway are destined to work an almost revolutionary transformation of the South, not only economically, but also, in the long run, socially and politically. The inflow of Northern and European capital to develop Southern natural resources will be a continually swelling tide. The current of immigration that so long refused to cross Mason's and Dixon's line has at last broken through, and within twenty-five years the immigration of European whites into the cotton, sugar and rice belts will be one of the conspicuous phenomena of our population statistics. The third movement is that of Western and Southwestern farmers from Missouri, Kansas, Indiana and Illinois into the truck farming lands of the South. Within the last year between seventy-five thousand and a hundred thousand families from Missouri and neighboring States, as far east as Indiana, have thus changed their place of abode. Many of the great railroad systems are actively furthering both the reflex movement from the West and foreign immigration, in connection with land development schemes.

Such negroes as possess qualities that make them adaptable and ambitious will doubtless find a place in the new order of things. As a race, the negro is facing a crisis in his existence, and the industrial pace will not slacken to enable him to make up his mind at leisure what he had better do next. Those forces which are making for education and thrift are all that will save negro trash—or white trash, for that matter—from sinking into pauperism and crime.

Steel and the Shipyard Trust

We observe that some who feel keenly the loss of dividends on Steel Corporation common shares are inclined to believe that the methods of Steel Corporation financiers and promoters have not differed materially from those which the Shipyard Trust inquiry has brought to light. This was to be expected, for persons prominent in connection with the first of these undertakings were influentially concerned in the second. But it would be unjust to assume that motives and methods were the same in both cases. Such an assumption is forbidden by the evidence.

To the great disappointment of many unfortunate investors the 4 per cent. dividend on Steel common stock was reduced by one-half in October, and has now been discontinued. The par value of this common stock exceeds $500,000,000; the shares, for which the highest market price in 1902 was nearly $47, have fallen to the neighborhood of $10. Dividends are no longer paid because the company's earnings have suddenly and seriously declined. There is no doubt about this. In 1902 the net earn-

ings were $133,308,000, or an average of $11,100,000 per month. For the first nine months of 1903 the average was $10,450,000; for the six months ending with September it was $11,500,000. Then the earnings dropped:

September	$9,120,134
October	7,675,141
November	4,069,901
December	3,100,000

And for the whole year there was available for dividends on the preferred and the common shares a balance of only $55,000,000, against $90,000,000 in 1902. At the end of that year there were orders on hand for 5,347,000 tons of products; the orders now are for only 3,215,000 tons. These figures show why there is no dividend on the common shares. The suspension of this dividend has been warranted by the condition of the company's business.

We are not saying that the Corporation is reasonably capitalized. We could not truthfully say so. The enormous volume of its stock was made to include the country's prosperity, the "boom," the tariff, and water enough to satisfy the owners of the constituent concerns, who sold long ago, we presume, a majority of their shares to the public. We are not commending that expert manipulation of the Exchange market by a master hand which so successfully distributed the shares that the underwriting syndicate won a profit of more than $50,000,000. Due caution would have forbidden the payment of 4 per cent. on the common stock from the start. Earnings to warrant such payment could be sustained only by the maintenance of high prices, an absence of annoying competition and an unfailing demand for the company's products. But there was a great mass of common stock in hand, and will anybody say that it could have been marketed at $45, $40, or $30 if those who controlled it and the company had not at once begun to pay a dividend of 4 per cent.?

As for the overcapitalization, surely there was sufficient publicity about that. All who had any knowledge of investments understood how great a risk was involved in the purchase of such shares at prices yielding (for the present, at least) a net return of 10 or 12 per cent. No philanthropic and conscientious banker, it seems to us, could have advised persons of small means to buy Steel common. If overcapitalization is contrary to public policy, it is high time for the people to prevent it by legislation. They have the power to do so. The Corporation's manufacturing business has been well managed; no similar company has ever given so much publicity to official reports concerning its affairs.

Why have its earnings suffered so great a decline? Because of the failing demand for its goods. There were two leading causes thus affecting the demand: first, a paralysis of the building industry in New York, Chicago and other cities, due mainly to the action of corrupt walking delegates; second, general retrenchment and caution, either suggested or compelled by the prolonged decline of securities. In action and influence these depressing forces, with others of less importance, were so associated or interwoven that no one of them should be considered by itself. Sam Parks boasted that he had increased wages in the building industry; he and his kind have now been clearly instrumental in reducing the wages of 200,000 iron and steel workers. Whatever may have been the shortcomings of Steel Corporation financiers and promoters, they cannot fairly be accused of depressing the Corporation's business. To the causes already mentioned should be added a growing competition of independent companies, capitalized upon a conservative basis.

It is not asserted that those who organized the Steel Corporation or those who have controlled its fortunes have violated the laws (altho some may except the Trust statutes) or have been guilty of contemptible and puerile diversions in finance. With respect to the Shipyard Trust the case is somewhat different, as all who have read reports of the inquiry must know. The latest contribution to the history of this organization is one made by the State Superintendent of Banks relating to the Trust Company of the Republic, which undertook with unfortunate results such part of the promoting as was not intrusted to agents who besought the favor of a curious lot of persons in Paris. Here

was a plain violation of law in the making of large loans to the President of the Trust Company upon no security except the Shipyard stocks. At the Superintendent's demand the steps wrongly taken were retraced, and the company's solvency was preserved, at the cost of a loss of $1,000,000, which swept away the surplus and half the stockholders' investment.

Superintendent Kilburn asks for legislation to prevent Trust Companies from undertaking schemes of promotion. This is not the first instance of an unwise and dangerous connection between a Trust Company and the promoters of a combination, but, as a rule, the great Trust Companies of New York do not need the restraint which the Superintendent suggests. Those who, in this instance, as he says, "flagrantly transgressed the law," appear to have been very fortunate thus far in escaping prosecution. They have not avoided exposure; and the proof of their sins, with the Shipyard testimony and the letters which describe that remarkable hunt for investors and underwriters among the gamblers of Paris, makes a repulsive chapter in the history of a kind of "high finance" of which we have had much more than enough.

Carnegie and Nobel Awards

Almost simultaneously come the announcements of the grants made by the Carnegie Institution for the promotion of scientific research and prizes accorded by the Nobel Foundation for the greatest scientific triumphs, and it is interesting to compare the working of these two diverse methods for the advancement of knowledge. Obviously, those who have charge of the Nobel Fund have the easier task of the two; for, however difficult it may be to decide what man has made the most important discovery in physics, for example, it is still harder to determine what man is going to make the most important discovery in physics in the future. In the first case there is only choice between the claims for pre-eminence of half a dozen whose names any student of that branch of science can give; in the second there are thousands of potential geniuses or pretentious aspirants, comparatively unknown, and the most worthy of them may be the most obscure or modest.

The more original the experiment, the less certain it is that the results may be profitable, and the ablest investigator must often pursue fruitless lines of work. In such cases he usually prefaces his report by the words, "These results, altho negative, are of just as much value from a scientific standpoint as tho they were positive," which may be true enough, but we notice that scholars prefer to publish those papers which do not need such an introduction. The difference between the two methods is the old question whether it is better to reward promise or performance. Some educators wish to abolish the custom of granting honorary degrees. Others would omit the degree given at "Commencement," when the student begins his life work, and have only honorary degrees awarded to those who have really accomplished something of value for their fellow-men. Those who had expected that the income of the Carnegie gift, as it is the largest amount of money free from all hampering restriction to be given for the furtherance of pure research, would produce in the first year some imposing and astonishing results, such as the solution of some one of the problems which have perplexed the human mind for ages, or the discovery of some great natural force for the service of mankind, will look over the list of grants in the Year-book about to be published with a sense of disappointment. Among the researches assisted by the money bestowed last year there are none that would enable one to use the time-worn adjectives "epoch-making" and "revolutionary."

Instead of building in Washington expensive laboratories or devoting large sums to a single line of investigation of especial need or promise, as some of their numerous advisers have recommended, the Trustees of the Carnegie Institution have adopted for their first year the less spectacular but much safer plan of distributing the $200,000 at their disposal among over one hundred investigators in every branch of science. One who is at all familiar with scientific workers in this country will recognize most of the names given, and will not question that the

money given them will be productive of good results.

Astronomy, oldest of the sciences, gets the lion's share, $26,800, and psychology, the youngest, gets least, $3,600. Astronomy is already more heavily endowed than any of the other sciences, for a rich man is much more apt to give money for the biggest telescope in the world than to pay for the more humble apparatus, such as microscopes for a botanical or test-tubes for a chemical laboratory. It is somewhat curious that astronomy, which is the most abstruse and impractical of the pure sciences, should appeal so much more strongly to " the practical man " than those which touch human life more closely and promise more tangible benefits.

The part which most closely fulfils Carnegie's purpose of discovering the exceptional man and setting him at the work for which he is best fitted is the appropriation of $25,000 in amounts of $1,000 or less to young men who have shown ability and desire to follow special lines of inquiry. Such an amount, small as it is, coming at a critical time, may save to science a brilliant mind. If M. and Mme. Curie could have received a few thousand dollars some years ago, when they were trying to scrape together enough money to buy uranium residues for the extraction of radium, they would not have had to cut down on the cost of their lunches and ride their bicycles to school to save three sous bus fare, as they did.

Probably it would have been more welcome to them then than the $20,000 they have just received from the Nobel Fund as half of the prize for the most important discovery in physics. The other half of this prize goes to M. Becquerel, whose work on the new forms of radiation from minerals, the " Becquerel rays," led to the further investigations of the Curies. Our readers have been kept informed on these remarkable discoveries by numerous articles in the editorial columns and in the " Survey of the World," and by the first report of her work from Mme. Curie herself published in this country.

The Nobel prize in chemistry goes to Prof. Svante Arrhenius, of Stockholm, for his theory of ionization, which will be discussed later in these columns. The medical prize is awarded to Dr. Nicholas Finsen, of Copenhagen, who has been so successful in treating lupus and other skin diseases by the ultra-violet rays filtered from either the sunlight or electric light. For the greatest work in literature in the ideal sense the prize goes to Dr. Björstjerne Björnson, of Christiania, whose stories are almost as well known in this country as in Norway. We are glad to print an essay by and about him elsewhere in this issue.

The awards have been criticised because of the singular fact that three of the four are given to Scandinavians, altho Nobel expressly stipulated that no favor should be shown to Scandinavians in making the awards, but that the prizes should be open equally to all the world. However, no one can say that the recipients this year are not worthy, even tho he question whether they be the most worthy.

The Parisian press has become aroused to the importance of keeping the leading position which France has recently attained in certain fields of science and is collecting subscriptions to assist French scientists in their researches. Of the money so obtained $12,000 has just been awarded to Madame Curie for the prosecution of her studies on radium and $6,000 to Professor d'Arsouval for the same purpose, and $8,000 to M. Brauly for his work in wireless telegraphy. This is a very commendable form for the expression of patriotic zeal, and we hope it will spread as other Paris fashions do, all over the world.

Instructing Senators

Louisiana and several other Southern States have instructed, or will instruct, their Senators to vote for the Panama Canal Treaty. This is done by a concurrent vote of the two Houses of the legislatures of these States. Such instruction in other cases may be given to the Representatives of the States in the lower House of Congress. It is herein assumed that the members of the local legislatures have a better sense of what is to the interest of their State or of the country than have those men whom they have elected to the United

States Senate, or whom the people have chosen to represent them in the House of Representatives.

In the present case it would seem to the benefit of the country that such instruction is given. There was some danger that the two Senators from Louisiana might feel obliged by a caucus decision to vote with their party against the interests of their State and of the country. It was recognized in the vote taken in the Democratic Senate caucus that State legislatures might give instructions that must be obeyed. Under the influence of Senator Gorman there was danger that the Democratic caucus would require the Senators to vote as a unit on the Panama Treaty, and the instruction given will relieve us of the danger of loss of the treaty. And yet it is far from clear that it is wise or right for a State legislature to bind the action of its Senators against their own judgment.

These Senators are supposed to be chosen for their wisdom. They should lead, not follow, public opinion. Their judgment, looking, as it does, over the whole State and the whole Nation, taught by a larger experience and outlook, ought to be wiser than of the local representatives of a small section of a single State. They are chosen, it is true, as representing the principles of a party to which they belong, and to these principles they are pledged. If they change their views on the questions upon which they were elected they should resign their places; but it is, and should be, left to them to decide in what way they can best carry out those principles, and how they shall vote for the interests of their State and Nation, and this because they are presumed to be not only men of independent judgment, but also of better judgment than those who have chosen them. They are, or should be, the picked, wisest men of their States. To instruct them is to deny and insult their good judgment and ability.

We are glad that it is not a usual thing for a State to instruct its Senators and Representatives. It would be unfortunate if the custom, occasionally in use, should spread. Massachusetts is not wholly satisfied with the votes of Senator Hoar, but she does not venture to instruct him how to vote. If she should, we presume he would understand it as a suggestion that he resign his seat, and that is what such instruction ought to be taken to mean—namely, that the State has lost confidence in its Senator's good judgment and desires to elect his successor.

But if a State ought not to presume to instruct its Senators, much less should the members of a party in the Senate or the House presume to instruct each other how they shall vote. The Democratic Senators in caucus bind each other to vote as a unit, even against the judgment of some individual Senators. We are glad that the Republican Senators take no such caucus action. It is utterly wrong thus to bind the votes of those who are chosen to use their own best judgment as to what is wise for their States and for the Nation. This vicious caucus instruction is the fountain and origin of further evils. It compels instruction by State legislatures. Because some thirty or more Senators have banded together to manacle each other the State legislatures must be called in special session to unbind their hands. One can hardly conceive a more ridiculous condition or fatuous policy. It is no shining evidence of the political astuteness of Senator Gorman.

Fire Drills

There can be no fire drills in the case of theater audiences, but the advantage of a well practiced fire drill, such as is familiar in many schools in our large cities, and ought to be familiar in all, is illustrated by a fire in Toronto last week. A three-story schoolhouse, with six hundred children, caught fire the day school opened after the holidays. Smoke was observed coming from the walls about the registers on the second floor; the teacher telephoned the principal on another floor; he made a speedy investigation and sounded the fire-gong, which was the signal for a fire drill of the pupils. They responded immediately. None of the teachers or scholars was in a panic, and in less than two minutes the whole school was on the street, without their wraps. Then the larger boys went back and secured the wraps from the lower story and some of those from the second story, but the

whole building was in flames, and half the children lost their outer clothing. Not a single life was lost, nor one child injured, altho the building was totally destroyed. That one experience was enough to justify and repay all the trouble that had been had in fire drills during a dozen or more years. Doubtless if the audience in the Chicago fire could have been as cool as these drilled children there would have been few, if any, lives lost. They do some things well in Canada.

Race Suicide and Female Labor

The bearing on what President Roosevelt calls race suicide of the employment of women and girls in factory life is suggested to us by a correspondent, a workman in Paterson, N. J., a city which, like the neighboring city of Passaic, employs many thousands of women in its silk and woolen factories. He says:

In this city a few years ago a man working at two looms would make about fifteen dollars per week, and could give his children a grammar school education. To-day if he can average nine dollars per week he is fortunate, while his children leave school from two to four years before their course is finished. In Passaic there is a large colony of Eastern Europeans, Huns, Slavs, etc., who work in the factories there. They were for the most part imported by a woolen company which employs, it is reported, in the neighborhood of four thousand men, women and children. In this mill there are about two thousand full grown women whose earnings do not average three dollars per week; their husbands, brothers, etc., average about six dollars per week. The more skilled operators get more, but their number is comparatively few, and no Americans, of whom there are thousands capable of doing the work, need apply; they are all imported. The unmarried women employed in this mill and others, as this firm has many imitators now in their un-American policy, club together, six or seven occupying one room for eating, sleeping, etc. One of our judges is authority for the statement that the district in which the colony is located is responsible for ninety per cent. of all the cases appearing before his court.

I lately asked a friend of mine returned from the West if he had married.

"Married!" he replied, "do you think I am a fool? President Roosevelt says every man ought to marry; that we are responsible for race suicide, and yet he knows that the lowest classes of Europe are coming here at the rate of nearly a million a year. Do you think I would be guilty of marrying and raising a family to have to compete with them? Much as I would like a home of my own I can not curse my offspring thus; let a stop be put to immigration and the President will have no cause to cry about race suicide."

Our correspondent would shut out foreigners from competition with native labor. Why not also shut out women from competing with masculine labor? It is the kinds of labor like that of masons, carpenters and plumbers, where only men are employed, that get the highest wages.

A Cursing Elijah

We present our heartfelt commiserations to Dr. James M. Buckley and the Rev. Stephen Merritt, an aged Methodist minister, in view of their evil plight if Dr. Dowie has any influence with powers above or below. Father Merritt was proclaimed one of Dr. Dowie's converts during his recent meetings in this city. Dr. Buckley could not believe it true, and he received assurance from Father Merritt that if he signed an application for membership, he thought it was something else. Then Dr. Buckley, in *The Christian Advocate*, made a severe attack on Dr. Dowie, under the title "A False Prophet." Next, in the *Leaves of Healing*, Dr. Dowie prints documents in Father Merritt's own handwriting, which seem to prove that he knew what he was about when he applied for membership in Dowie's Zion Church; and he proceeds to take the final step in the following words (in capital letters):

"In the Name of the Most High God, I deliver James M. Buckley and Stephen Merritt 'unto Satan for the Destruction of the Flesh, that their spirits may be saved in the day of the Lord Jesus.' . . .

"May it be ere their bodies perish, they shall truly repent and be saved!

"If they will not repent, all men and angels will say, 'Their Damnation is Just.'"

Then followed this prayer:

"O Father, I have committed these men, in Jesus' Name, to Satan, for the punishment of the flesh. Let Satan have them, and their bodies be destroyed, if they do not repent, and their spirits be saved in the Day of the Lord Jesus. For His sake. Amen."

If we know Dr. Buckley he will laugh at the curses of the new Elijah, and

will have no special fear that Satan will get his flesh. This is not the first time he has been cursed, and he has fed on it. But what monstrous megalomania is it that will thus assume to pronounce destruction and damnation on one's critics, with the evident desire and expectation that the Lord will cut them off before their time. Such curses are not falcons that can be unhooded to hit their quarry; they are more likely to come home to roost.

Local Prohibition in Texas

Very interesting statistics of prohibition and crime are reported from Texas, where the local option law assures that prohibition of the saloons shall be enacted only where it can be enforced by public sentiment. There are in that State 23 prohibition counties that have no convicts in the penitentiary, and 9 with only 1 convict each. In 39 prohibition counties there are only 23 convicts in all. San Jacinto County alone, with a population of 10,277 and the open saloon, has 25 convicts, and Montgomery, with open saloons and 17,067 population, has 21 convicts in the State prison; and these are two poor counties in the piney woods. Collin County, with 50,000 people and no saloons, has 20 convicts; Lamar County, with 48,000 and saloons, has 96. A large part of Texas has no saloons, and has one convict in 1,500 of population, while the territory with saloons has one convict for every 500 of population. Such figures teach a lesson.

The Abbe Loisy

At last it is clear what has been done at Rome with the courageous Abbé Loisy. It was announced in the dispatches that the Cardinal Archbishop Richard, of Paris, had succeeded, after a sojourn of several weeks in Rome, in securing the condemnation of a number of propositions taken from the Abbé's books, and the putting of them in the Index of prohibited books. This has really been done, but there was delay in so informing Abbé Loisy himself. It is certain that he had strong friends at the Vatican court, and even in its inner circles, friends who succeeded in protecting him so long as Pope Leo lived. Perhaps the position of Abbé Loisy which excites the most criticism is not so much his acceptance of many of the views of the higher critics as to the New Testament as his denial that the Gospel of John is, like the Synoptic Gospels, a historical view of the life and sayings of our Lord, altho he regards it as a correct development of Christ's teachings. He would see in the Gospel of John a work which has something of the relation to the mere historical Synoptics which the Dialogs of Plato bear to the Memorabilia of Xenophon, both giving the philosophy of Socrates, but one in his words and the other as legitimately developed. When the scientific teachings of St. George Mivart were condemned at Rome he resisted; but now that those of Abbé Loisy have been finally condemned, we presume he will accept the condemnation of the errors as mistakenly supposed to be found in his books. When asked by an interviewer what he would do if his teachings were actually condemned Loisy replied:

"I am ready to retract any errors which others may deduce from my book by placing themselves while interpreting it at a point of view different from that which I occupied in composing it."

When further asked whether he would retract if the actual teachings of the book itself were condemned, he replied:

"In that case I will consult my conscience, and will do what it commands me,"

which was indefinite enough.

It is hard to find a luminous refutation of this utterance of Governor Bates, of Massachusetts, in his second inaugural address:

"Women receive the benefits of our educational system. They outnumber the young men in all our schools, colleges and universities. Equally with men do they pay their taxes, and they are held equally accountable for infractions of the law. They are equally interested in the economic and efficient management of civic affairs. They should have the same right as men, if they so desire, to vote for those who are to represent them in that management—and that, too, irrespective of the question whether other women, similarly situated, desire to exercise that right."

Insurance

Statistics as to Suicide

PROF. WILLIAM BACON BAILEY, of Yale University, in connection with his department of statistics and sociology has recently furnished some interesting statistical information upon the subject of suicides in the United States during the past decade. The number of cases to which reference has been made is 10,000. Professor Bailey has classified them as to age, sex, locality and time. The predominant suicidal age is shown to have been between 35 and 40 years. More suicides occurred by married persons than by those not married. Of the 10,000 cases observed 7,781 were males and 2,219 were females. The observations of Professor Bailey established the fact that more married men became suicides than did those of the other sex in like condition. More single, widowed and divorced women commit the act of self-destruction than do men in like condition. Shooting is the favorite mode and despondency is the principal cause of suicide. Monday leads as the day most favored by suicides, particularly by males. Saturday is the day of fewest suicides. Female suicides prefer Sunday to Monday as the day to put a period to existence. Of the 10,000 cases under observation 3,687 occurred in the twelve hours before noon to 5,848 in the remaining twelve hours. Beginning with midnight there is a continuous increase until 6 P.M. The three hours from 6 to 9 P.M. show a falling off, while from 9 o'clock until midnight is the period of greatest frequency. All this may well be studied not only by insurance companies interested in such hazards, but by those contemplating suicide and who wish to heed the conventions.

ADVICES from Boston are to the effect that Osborne Howes, secretary of the Board of Fire Underwriters of that city, has been appointed honorary Consul for Japan in the Athens of America.

....*The London Times* under date of January 9 states that the insurance rates on war risks covering marine shipments are generally well maintained and that such insurance is placed with increasing difficulty. Actual business is for the most part confined to the covering of general cargoes on neutral steamships against hazards which might arise in case a third power should be drawn into the Russian-Japan controversy.

....Embezzlements and defalcations for the month of November as tabulated in the current issue of the monthly *Bulletin* of the Fidelity & Casualty Company show a considerable falling off in amount in comparison with the preceding month. In almost every case the November defalcations are gratifyingly less than those of October, the difference being $1,533,498. The November items are given in detail in the following table:

Banks	$58,000
Building and loan associations	500
Benevolent societies and institutions	33,867
Court trusts	27,000
Federal and State	72,410
Firms and corporations	178,536
Insurance companies	121
Municipal	62,410
Transportation companies	130
Miscellaneous	16,960
Total	$449,934

Insurance Statements

EQUITABLE LIFE ASSURANCE SOCIETY OF THE UNITED STATES.

The preliminary statement of the Equitable Life Assurance Society, issued on January 1st, shows the total assets of the company to be $380,000,000, which is an increase of $20,000,000 over last January. The net surplus is now $73,000,000. The total income for 1903 was $72,000,000, which is $4,000,000 more than the year previous. The assurance fund and all other liabilities has now reached $307,000,000. Last year it was $285,000,000. The amount of money paid during the year just closed for death claims, endowments, annuities, surrender values and dividends was $32,000,000. The new assurance written exceeds by more than $40,000,000 that of any year in the history of the society. The amount of insurance that is binding has reached the sum of $1,400,000,000. The President of this great company is James W. Alexander. James H. Hyde, a son of the late Henry B. Hyde, founder of the Equitable, is the Vice-President.

Financial

Sale of New York City Bonds

COMPTROLLER EDWARD M. GROUT will receive proposals on January 20, 1904, for $10,000,000 3½ per cent. Corporate Stock of the City of New York. These bonds are exempt from all taxation in the State of New York except for State purposes.

Financial Items

CAPITAL applications in Great Britain during 1903 were the smallest in ten years, falling to £108,462,000, from £153,812,000 in 1902, and £159,358,000 in 1901.

....The gold output of the world in 1903 is estimated by the *Engineering and Mining Journal* to have been $327,049,750, being the largest on record, and exceeding that of 1902 by $28,000,000.

....By an agreement made last week concerning the use of a tract of land, the way has been opened for a continuous electric trolley road between New York and Philadelphia. It is said that the line will be completed before the end of February.

....Bank clearings of the entire county for 1903 were 7½ per cent. below those of 1902, and nearly 8 per cent. below those of 1901. Last year's total was $109,267,527,062. Outside of New York there was a slight increase, but the decrease here was 13½ per cent.

....The City Trust Company of New York, of which James Ross Curran is President, began business March 1, 1899. The annual statement of the company for the year ending December 31, 1903, shows total resources of $15,262,352. The capital stock is $1,000,000, surplus and undivided profits $1,769,795, and total deposits $11,752, 469.

....The annual statement of the Trust Company of America for the year ending December 31, 1903, shows total resources of $20,167,736. The capital stock is $2,500,000, and the surplus and undivided profits $3,074,850. The deposits aggregate nearly $14,500,000. The President of the company, Ashbel P. Fitch, was formerly the Comptroller of the City of New York.

....The Long Island Loan and Trust Company, whose annual statement is just issued, has reached the close of its twentieth year of business, having passed without loss through the financial panics of 1884, 1893 and 1896. The total resources are now $9,174,362. The capital stock, surplus and undivided profits amount to $2,488,218. The total amount of deposits $6,605,200.

....Comptroller Ridgeley pointed out, in his remarks before the Bankers' Convention, that bank deposits in the United States had increased since 1895 from $4,900,000,000 to $9,525,000,000, the gains in certain States having been as follows, in millions: Texas, from 35 to 80; Iowa, from 78 to 211; Nebraska, from 35 to 82; California, from 200 to 406; Oklahoma and Indian Territory, from less than 2 to 27. The increase west of the Mississippi has been from $701,000,000 to $1,700,000,000.

....The Van Norden Trust Company of this city, of which Warner M. Van Norden is President, has issued a statement comparing the resources and liabilities at the end of 1902 and 1903. The total resources December 31, 1903, were $7,793,845, an increase of $929,749. Deposits show a gain of $853,868, the total deposits December 31st being $5,657,036. The capital stock and surplus is $2,000,000.

....Dividends announced:

U. S. Fire Ins. Co., 3 per cent., payable January 11th.

N. Y. & N. J. Telephone Co., 1½ per cent. and extra 1 per cent., payable January 15th.

Am. Car & Foundry Co., Preferred No. 19, 1¾ per cent., payable February 1st.

Am. Car & Foundry Co., Common No. 15, ½ per cent., payable February 1st.

Rock Island Co., Preferred, $1.00 per share, payable February 1st.

Louisville & Nashville R.R., 2½ per cent., payable February 10th.

Empire City Fire Ins. Co., 3 per cent., payable on demand.

Amer. Chicle Co., Common, 1 per cent., payable January 20th.

The Independent

Vol. LVI NEW YORK, THURSDAY, JANUARY 21, 1904 No. 2877

Survey of the World

National Politics

Owing to the persistent circulation of reports asserting that Senator Hanna was striving in many ways to procure the Republican Presidential nomination, and that he was about to announce his candidacy, the Senator once more, on the 15th inst., declared publicly that he was not, and never had been, a candidate:

"I have been importuned by my friends of late to define my position in regard to the report that I am seeking the nomination for President. In answer to these requests I have caused to be mailed about 2,000 letters wherein I stated positively that I am not and will not be a candidate. The alleged opposition to the nomination of President Roosevelt has been overestimated and magnified greatly by Democratic papers and others with Democratic proclivities. Mr. Roosevelt has given the country a clean cut administration; and when he is re-elected, as I am sure he will be, he will continue to be the patriotic citizen he has been in the past, and will ever have at heart the welfare of his country and the people."

It has been said that the Senator, as Chairman of the National Committee was delaying the formal call for the National Convention in order that delegates in his interest might secretly be selected, and that the call would contain unusual provisions designed to further such a purpose. Apparently because of these reports, Chairman Penrose, of Pennsylvania, did not wait for the National Committee, but issued on the 14th the call for a convention in his State. Senator Hanna's call was issued, however, on the 16th, and it was found to differ in no way from those of past years. He explained that the delay had been caused by his illness, by questions arising concerning hotel charges at Chicago, and for other reasons of no political significance. It is reported that the Senator has undertaken to obtain control of all, or a large majority, of the Ohio delegates, but that in this movement he opposes Senator Foraker and seeks to exert a dominating influence in support of the nomination of Mr. Roosevelt. On the 12th, Mr. Hanna was re-elected Senator by a vote of 86 to 21 in the House, and 29 to 4 in the Senate.—The Democratic National Committee by a vote of 28 to 21 (for Chicago) decided that the Democratic National Convention should be held in St. Louis, on July 6, or two weeks later than the convention of the Republicans. A majority of the delegates had expected that Chicago would be chosen. The movement for St. Louis was due to the discovery that the candidacy of William R. Hearst must be reckoned with, and to some fear that the influence of the galleries at Chicago, where he has a newspaper, would be exerted in his interest. It is now announced that he will establish a newspaper in St. Louis within thirty days. At the committee meeting it was asserted that he would have the delegations from Wisconsin, Wyoming, California, Arkansas and Kansas. He appears to have the support of many labor organizations and of a considerable part of the radical Bryanite element of the party. Mr. Gorman was the leader of the movement to substitute St. Louis for Chicago; he also, in the Senate, conducts the campaign against the Panama Canal treaty. Mr. Hearst's newspapers, having remarked that St. Louis was chosen "for reasons personal to one candidate rather than

for the general interest of the party," have now changed their attitude toward the canal question, turning from Nicaragua to Panama. Mr. Bryan met the members of the committee at the time of the meeting. It is said that he opposes the movement for Judge Parker because he thinks the latter's support comes from the conservative or Cleveland element of the party. The power of Tammany's new leader, Mr. Murphy, is clearly recognized, and there is much curiosity as to which one of the several aspirants he prefers. It begins to be suspected that he has Mayor McClellan in mind. An apparently authoritative statement is published that the paramount issues in the Democratic platform will be the restraint of Trust corporations and a reduction of the tariff. Mr. Bryan, it is said, will not ask for an indorsement of the currency issues of past platforms.

Panama and the Canal

General Reyes has started for home, convinced that he can accomplish nothing by remaining in Washington. In response to his statement of grievances and his protest against the action of our Government, he has been informed that the case cannot be reopened and that he cannot reasonably hope for a restoration of Colombian sovereignty on the Isthmus. It was reported that he had asked in vain for a submission of the correspondence to the Senate, and had then threatened to make it public. He says, however, that he shall not do this. He returns, it is believed, in order that he may retain his influence in Colombia. When the Presidential Electors were chosen a large majority of them expressed a desire to vote for him. The Electors will vote on February 2d, and it is said that during his absence, and owing to the failure of his mission, they may give the Presidency to another candidate. Before his departure he arranged for further consideration of the Panama question between our Government and some representative of Colombia. He left Washington for New York on the 11th, and on the 12th, after a Cabinet meeting, Secretary Root published the following statement concerning the Government's policy:

"The publication in various quarters of news indicating that the Government is preparing to send troops to the Isthmus to carry on military operations against Colombia has been the source of considerable annoyance to the Executive and to the War Department. No state of war exists between the two countries; no inauguration of hostilities is contemplated by this Government; no preparation for war is being made. It is not believed by the President or by the Secretary of State that any occasion for the employment of troops on the Isthmus is likely to arise.

"They have used their utmost efforts to convince Gen. Reyes and the Bogota officials of the friendly intentions of this Government toward Colombia and of their readiness to use their good offices in the settlement of any questions in dispute between Colombia and Panama. It is difficult for them to believe that the authorities in Bogota can be so blinded by passion and prejudice as to declare war against us; and even if this ruinous step should be taken by Colombia, this Government would be in no haste to respond to her challenge.

"The President makes all possible allowances for the natural excitement in Bogota over a state of things for which the Colombian Government is alone responsible and of which it was fully forewarned; but the Colombians must sooner or later recognize the irresistible force of accomplished facts, and the sooner this is done the better for all parties. We have done them no wrong; we would like to be of service to them; if they are wise, they will not put it out of our power to help them by any act of rashness and violence."

—In the Senate last week Mr. Bacon, of Georgia, introduced a resolution in favor of the negotiation of a treaty with Colombia for the adjustment of all differences, providing for payment to her, if it should appear that her loss of territory was due to our act, and for the submission of the entire matter to The Hague Court, if the two countries should be unable to agree as to responsibility or compensation. After a warm debate, in which many took part, Mr. Hale suggested a compromise resolution, requesting the President to tender his best offices to secure a peaceful adjustment of differences between Panama and Colombia with respect to any claim that Colombia should make concerning indemnity for loss of territory or increase of debt. This Mr. Bacon accepted. Mr. Carmack bitterly attacked the President in a long address, asserting that his acts had actually been war, that the rising "as of one man" on the Isthmus had been the rising of Mr. Roose-

velt, and that this was the beginning of complications with all the countries of South America. After he admitted that he sought to defend the treaty and to obtain a canal in Nicaragua, Mr. Aldrich asserted that he (Mr. Carmack) was really opposed to any canal. Mr. Depew said he had never known of a concert of action by railroad companies against a canal, but that, if there were such a combination, its most efficient allies were those who sought to defeat this treaty. Mr. Tillman became quite excited. When asked what he would have done if he had been President, he replied: "I would have said to Colombia: 'You're a mangy lot. You are obstructing navigation. Get off the face of the earth, and we'll take the country and build the canal.'" The President was eloquently defended by Mr. Spooner, who said that Mr. Roosevelt's "only enemies in the United States" were "the result of his obedience to law and his enforcement of it."—There was published a statement, believed to be authoritative, saying that the Administration did not intend to pay Colombia one dollar on account of the secession of Panama, and would not go before The Hague Tribunal as a party to any proceedings growing out of that secession. But if Panama should consent to permit that Tribunal to decide whether she ought to concede something to Colombia, our Government, it was asserted, would look with favor upon the assumption of some small liability by Panama and would even guarantee the performance of any obligation of this kind that she might assume. Negotiations on this basis were said to be in progress.—Owing to a committee amendment, giving the United States partial control of the harbors of Colon and Panama, it will be necessary to send the treaty again to the Isthmus, where its final ratification will be enacted by the new Constitutional Government, and not by the Junta.—The nomination of Minister Buchanan has been confirmed by a party vote.—President Schurman, of Cornell University, predicted in a public address, last week, that Colombia would make war upon the United States, and that our troops, after entering Colombian territory, would never stop until they had raised the flag over Bogota. "And where the flag has been raised," he added, "it will not come down." There was not sufficient warrant in the treaty of 1846, or in international law, for our action on the Isthmus, he said; our only warrant was our national interest and international need.

On the Isthmus

Panama's Constitutional Convention began its work on the 15th, with a prospect of finishing it in ten days. At last accounts there were 4,000 Colombian troops encamped at Titumari, near the Panama boundary. The revolutionists say that an army of 10,000 men could be raised on the Isthmus by conscription, but Gen. Huertas asserts that with 500 he could hold the mountain passes against all of Colombia's forces. Nearly all of the marines who were stationed at Yavisa have been brought back to the railway zone.—The report of a few weeks ago that Colombian troops had been carried to the island of Old Providence, 300 miles north of Colon, and in the latitude of Northern Nicaragua, proves to be true. Upon this island and the neighboring one of St. Andrews, 400 soldiers are now in garrison. The inhabitants of St. Andrews, having been oppressed and heavily taxed by these unwelcome visitors, recently sent to Panama a Commissioner, asking that their island be annexed to the Republic, but the Junta declined to do this. Guatemala has recognized the Republic.

Washington Topics

Edmund H. Driggs, formerly a member of the House from a Brooklyn district, who was tried upon charges relating to his sale of automatic cashiers to the Post Office Department, has been sentenced to pay a fine of $10,000 and to be imprisoned in jail for one day. There will be no appeal in this case. Mr. Driggs is disqualified from ever holding a Federal office. At Washington, the trial of August W. Machen (formerly Superintendent of Free Delivery), the Groff brothers, George E. Lorenz and Mrs. Lorenz, was begun last week. In this case it is charged that Machen received a large part of the money paid to the Groffs for certain devices used on letter boxes, and that the corrupt payments were made through the agency of the

Lorenzes.—In response to a resolution of inquiry, Attorney-General Knox reports to Congress that he has expended only $25,985 of the $500,000 appropriated for prosecuting violations of the Anti-Trust law. His list of cases prosecuted since the appropriation was made as follows:

"1. The Northern Securities case, which is awaiting decision now in the Supreme Court.

"2. The Beef Trust case, in which the demurrer of the defendents to the bill of complaint was overruled by Judge Grosscup in Chicago and an appeal taken from that judgment to the Supreme Court, where it is now pending.

"3. Railroad freight suits. Six of these have been filed against railroad companies in Illinois and eight in Missouri to break up relations alleged to be existing between the companies and certain favored shippers. These cases are ready for the taking of evidence.

"4. The case of the Jacksonville Wholesale Grocers' Association, alleged to be a combination in restraint of trade. Suit has been brought in the Northern District of Florida and issues have been joined.

"5. The Salt Trust case, in which the Federal Salt Company was found guilty in California of establishing a monopoly in violation of the law and fined $1,000 on May 12th, 1903.

"6. The case of the Cotton traffic pool, composed of the Western & Atlantic and the Illinois Central railroads. Suits have been brought against these companies in Georgia and Tennessee, which are still pending, although the pool itself has been dissolved and shippers are free to designate the road over which their products shall go."

—The subcommittee of the Senate Committee on Territories, who visited Alaska last summer, report that it is not advisable to organize a Territorial Government or to authorize the election of a Delegate by popular vote, but that a Delegate could be appointed by the President. Alaska needs roads, and the Committee recommend as a beginning the construction of a wagon road 450 miles long from Valdez, on the coast, to Eagle, on the upper Yukon. This highway would afford a good route to the Klondike through territory of the United States.

The Islands

At last the provisions of the Platt Amendment have been embodied in a permanent treaty between Cuba and the United States. This treaty, in which the Amendment is repeated word for word, was ratified by the Cuban Senate on the 11th, without debate and without a call of the roll. Only one vote, that of Señor Recio, was cast against it.—The bill relating to the tariff, passed at Havana last week, authorizes President Palma to increase the duties by additions not exceeding 30 per cent. Altho the House had expressed by a large majority its disapproval of the annual payment for the use of Church property (under the agreement made by Gen. Wood), it passed the appropriation for this purpose. —In Porto Rico, the Legislature is again in session. Republicans and Federals will unite in supporting a bill for a loan of $5,000,000. The Governor's message recommends an increase of the excise taxes, the adoption of the American Code of Civil Procedure, the appointment of a special tribunal for the settlement of questions pending between the Catholic Church and the Government, the establishment of industrial schools, and an appropriation for the study and the eradication of tropical anæmia, a disease said to be caused by a parasite.—At Manila, W. D. Ballentine, formerly inspector of customs, and John T. Miller, inspector of immigration, accused of conspiring to admit Chinese coolies disguised as merchants and bearing false certificates, have been acquitted by the Customs Court of Appeals, but are to be tried again upon fresh charges. These proceedings involve the American Vice-Consul at Amoy, and are said to be related to the investigation which is to be made at Washington concerning charges against consular officers at Shanghai and Canton.—Secretary Root opposes the Senate bill which provides that supplies for the army and navy in the Philippines shall be transported exclusively in American ships. This restriction, he says, would greatly increase the cost. A very small number of American ships would be available for use between Atlantic ports and the Islands, and the owners of them could easily control the freight charges. He would prefer a bill giving American ships the preference, provided that their charges should not exceed those of foreign ships by more than 25 or 30 per cent.

New Regime for Iceland

The constitutional conflict that has been carried on for about thirty years between Iceland and the mother country, Denmark has, by the recent concessions of the Danish King and Parliament, reached a happy settlement satisfactory to both countries. It has ended with a substantial and really a brilliant victory for the Icelanders, who have practically gained all their points. Iceland has a population of only 80,000, but it now receives its own Ministry, having its seat in Rejkjavik, and at its head a representative of the home Government, who, however, must be acquainted with the Icelandic language, and is to be taken from the ranks of the Icelandic politicians themselves. Among the other points gained are an increase in the number of representatives elected by the people, extension of the elective franchise, etc. To a certain extent the Icelanders can attribute their success to the fortunate circumstance that just at this time there has been a radical change in the Danish Ministry, the new Cabinet, composed of the "Left" or Liberal element, being naturally favorable to making concessions. The new arrangement ends a struggle that began in 1874, whence Iceland received its present constitution from the King of Denmark, which indeed gave the islanders a "Minister for Iceland," but this official was always a Dane, who in addition was in no touch with the Althing of Iceland. The legislative prerogatives of this body were also of little moment, as one-half of the twelve members that composed the Upper House were appointees of the King. As early as 1880 the agitation took the form of a demand for the greatest degree of self-government, consistent with a recognition of the rights of the mother country. The *modus vivendi* that has now been reached is practically the work of Dr. Valtyr Gudmundsson, a professor in the University of Copenhagen, and a member of the Danish Althing. The Parliament adopted the measures proposed, and the King has now formally sanctioned them, with the proclamation that they are to go into effect February 1st, 1904. The appointment of an Icelandic Minister has not yet been made, and the selection is looked for with great anxiety by the islanders. The Danish King gave his Icelandic subjects an additional surprise by permitting them to adopt an official State coat-of-arms that they had petitioned for many years. It is generally thought that this fortunate outcome of the old contest is owing, to a large extent, to the friendly visit paid by a large number of Danish students to Iceland in 1900.

Rioting Troops at Beirut

The failure of the Turkish Government to pay its soldiers has resulted in a mutiny at Beirut, where some 1300 men from Yernen, Arabia, were landed on January 11th. The troops demanded the payment of $80,000 back pay, with the threat of sacking the bank if they were refused. The Governor barrowed small amounts from the Ottoman Bank to quiet them, and orders have now been sent him from Constantinople to pay them in full. The armored cruiser "Brooklyn," the flagship of the European Squadron, commanded by Rear-Admiral Cotton, is now at Bierut, and in case the disturbances become serious can protect the American College.

Open Ports in Manchuria

In order to secure our commercial rights in Manchuria before the impending war should change conditions there the State Department has secured the immediate exchange of the ratifications of the new treaty with China by cable authorization. Instead of waiting in the usual diplomatic way for the actual documents to reach the respective capitals, which by the provisions of the treaty might not have been delivered until next October, Minister Conger cabled that he had received the copy from the Chinese Government, and on January 13, as soon as the Chinese Minister at Washington was given the other copy, the President signed a proclamation putting the treaty into effect at once. The consuls for the new ports have already been selected and their names will be sent to the Senate as soon as appropriations are made for their pay. Edwin V.

Morgan, who is selected for Antung, was formerly secretary of the American Legation at Seoul and is now in the office of the Third Assistant Secretary of State. James T. Cheshire, who was secretary of the American Legation at Peking during the Boxer riots, is appointed to be Consul at Mukden. Japan has also ratified a treaty with China of much the same character, providing also for the opening to trade of the port of Ch'ausha Fu in the province of Hunan and for international settlements at all three ports and in Peking. It is semi-officially stated by the State Department

"that the presence in these localities at an early date of American Consular officers and those of other nationalities—for all the nations having treaties with China acquire by our treaty and that with Japan the right to establish consulates at these places will greatly tend to the establishment of order in this much disturbed border land of China and will powerfully contribute toward insuring the principles of the 'open door,' to which this country stands irrevocably committed, as well as aiding in insuring the integrity of China and its administrative control over its Manchurian provinces."

This greatly strengthens the Japanese position, for it makes all the commercial nations of the world interested in what she has been contending for—that is, freedom of trade in Manchuria—and there is great rejoicing both in Japan and England over this timely action. Mukden is in the interior, and Antung, or Ta-Tung-Kao, is at present of no commercial importance and has a shallow harbor, but its position near the mouth of the Yalu River opposite Korea may enable it to be developed into a great trading center like Hong Kong, which when opened to the English was a barren rock island. Our trade with China is largely Manchurian, and rose from $4,000,000 in 1893 to $24,000,000 in 1903, but in the last few months has been falling off owing to the rumors of war.

Japan The reply to Russia was sent after a "conference before the Throne" of several hours between the Cabinet and the Elder Statesmen. Its contents are not known, but it is reported to be conciliatory in tone and not of the nature of an ultimatum, as no time was set for a reply. Russia's paramount interests in Manchuria are recognized, but it is insisted that the commercial and personal rights of the citizens of other countries there must be explicitly secured by treaty. The Czar is said to be personally in favor of peace, but it is not expected that Russia will agree with the Japanese stipulations. It is thought that war will not be declared for two or three weeks in any case, as Japan will need that time to collect her fleet. Russia is reported to have applied to Turkey for permission to send her Black Sea fleet through the Dardanelles. England will oppose any such violation of the agreement of the Powers made in 1841 and reaffirmed in the Treaty of Berlin in 1878.

Korea Many correspondents in the Far East exercise their imagination in reporting what goes on in the palace of the Emperor of Korea, but they agree in little except in assigning great importance to feminine influences and in the assertion that the Japanese court party has now gained the ascendancy over the Russian. There is little agreement in their narratives. All the legations at Seoul are guarded for fear of rioting, for the native press is clamorous for the slaughter of all foreigners. United States Minister Allen has ordered all women and children to remain indoors unless well guarded. The pro-Russian Ministers of Finance and the Interior have resigned and will be replaced by men more favorable to Japan. It is reported that the new Korean Cabinet will open to commerce the ports of Yongampho, Jikoho and Wiju. The Russian Minister at Seoul, M. Pavloff, says that Russia will oppose the opening of Wiju and will maintain the independence of Korea against Japanese invaders.

The Race of the Cruisers At the opening of our war with Spain the official action of our Government was delayed long after the people had made up their minds that there was to be war and were eager for it. This mysterious procrastination, as we now know, was due to the necessity of naval preparations, and the same explanation may account for the fact that Japan still

avoids sending an ultimatum, altho she is apparently bent on war and losing by the delay. The voyage of the "Oregon" from California to Cuba is paralleled by the race which the two Japanese cruisers are making from Genoa to Japan. When the arbitration and disarmament treaty was signed between Chile and Argentina each country had two armored cruisers almost ready for sea; the Chilean vessels were being built in England and the Argentine in Italy. Russia bid for both pairs, but England secured the former and Japan the latter. Japanese ships in the Mediterranean so far from the scene of action, with only a few Japanese sailors and officers and in the presence of a Russian fleet of eleven ships, at a time when war might break out at any moment, were of little use; but here England again proved her friendship by sending ten officers and one hundred men from the British naval reserve to assist in manning the vessels. The two cruisers, now named the "Niasiu" and the "Kasaga," with a crew of such mixed nationalities as could be picked up at the port, sailed from Genoa to Naples, where the armament and ammunition had been prepared. This was put on board in twenty-four hours, and the cruisers left on January 12th under sealed orders, leaving it uncertain whether they would go by way of Gibraltar or Suez. By a curious coincidence as they rounded Sicily they were met by two Russian vessels and soon after joined by nine British cruisers, which happened to be going that way. When they arrived at Port Said the Russian cruiser "Dmitri Donskoi" entered the canal first, but between her and the Japanese vessels was the largest of the British armored cruisers, "King Alfred," while the Russian cruiser "Aurora" and seven torpedo boat destroyers had to wait. This gives the two Japanese cruisers practically a clear passage at least through the Indian Ocean. The three fast steamships of the Japanese line to San Francisco, the "Nippon," the "Hong Kong" and the "America," have been requisitioned for transport service and will return no more to America for a while. The Japanese steamship service to Australia, Europe and Bombay is also suspended, which will give altogether twenty-five large transport vessels.

French Influence in Northwest Africa

The British power in Morocco seems to be continually on the decline, and the Minister of War, Si Meheddi el Mennebhi, whose influence over the young Sultan has been so great, is now dismissed from office and has gone to Tangier as the first stage of his pilgrimage to Mecca. He is a man of about 35, energetic and progressive, and since his return from London in 1901, where he went with Kaid Sir Harry Maclean, the English military instructor of the Morocco troops, he has been very active in introducing reforms in the former brutal and corrupt methods of collecting taxes and in army discipline and equipment. This has resulted in financial difficulties, since it both reduced the revenues and increased the expenditure, and the antipathy and suspicion of the orthodox Mohammedans have been excited against the Sultan for his adoption of European ideas and customs. The Sultan, Abd el Aziz IV, is twenty-five years old, and the son of a Circassian slave, the Lalla R'kia, who was given as a present to the late Sultan, and who resembled the Empress-Dowager of China in the power she exercised as well as in her lowly origin. The young Sultan took to European ways with enthusiasm, even going in for English sports, such as tennis, polo and automobiling, and devoting more attention to the introduction of the games than the arts and industries of civilization. A photograph of himself and his companions in European customs, violating both Mohammedan law and prejudices, was extensively circulated and was one of the causes which aroused the people to rebellion. The leader of this is Jilali el Zarhouny, a man not remarkable for ability, education or birth, who by assuming to be Moulai Mohammed, the One-Eyed, claims the throne as being the elder brother of the reigning Sultan. By means of some conjuring tricks he has become accredited by his fanatical followers with supernatural powers, and is in control of a large part of Southern Morocco in spite of the efforts of the Sultan and his late Minister of War to capture him. According to British views, the chief source of his power is the money supplied from the French se-

cret service funds. However this may be, his success and the loss of power and prestige of the pro-English Sultan unquestionably strengthens French influence in that portion of Morocco lying south of the Atlas Mountains and may lead to their securing a close connection between Algeria and Cape Juby and another link in the chain surrounding "the Empire of the Sahara."

The Empire of the Sahara

The scheme which M. Lebaudy is promoting for the opening of the Sahara desert to commerce is very similar to that projected by the English Mackenzie Company in 1886, when the attempt was made to construct a railroad from the Northwest Coast into the interior. The occupation of Timbuktu by the French interfered with their plans and the rights of the Mackenzie Company were sold for $250,000 in gold. Such a railroad can now be constructed from some point near Cape Juby to Timbuktu, and even to Lake Tchad, without passing through any territory outside the French sphere of influence. As this pathway to the sea is not capable of realization for many years to come, if at all, the French have been endeavoring to find a more direct route to the south from their possessions in the interior, and last July Captain Lenfant, of the Colonial Artillery, was sent to see if a navigable passage could not be found from the Niger to Lake Tchad. In this he has been successful, and his launch, which went up the Niger and its main tributary, the Binue River, has passed into the Shari one of the rivers supplying Lake Tchad. Previous to this Lake Tchad was reached only by a very roundabout way up the Congo.

Curzon's Expansion Policy

At this time, when the attention of Russia is being concentrated on her Manchurian possessions and all her forces may at any moment be needed in the Far East, the Viceroy of India is making use of the opportunity to increase the prestige of England on his Northern and Western frontiers and to recover the ground which has been lost in the past ten years by the diplomatic maneuvers of Russia. In the mere relations between India and Tibet, considered alone, there is no crisis requiring the invasion of the latter country by troops in the dead of winter, and the reasons alleged, such as the increase of trade and the suppression of thieving raids from the mountains, are manifestly inadequate to explain such energetic measures as Colonel Younghusband's expedition. One immediate effect of importance will be the weakening of Russian influence over China, for the Chinese cannot fail to be impressed by the resolute stand made against Russian advances by Japan on the east and the unopposed occupation by an armed force of Tibet, which, while nominally a Chinese province, has lately been depending more and more on the protection of Russia. During the Chinese-Japanese War the priests of Tibet were called upon to assist the Chinese army by their prayers. Ever since the present Manchu dynasty has been in power these Buddhist prayers have been accepted in lieu of tribute from Tibet, and since the occasion was such an important one sham battles were arranged between the priests to give the necessary vividness to their feelings and fervor to their petitions. Whether the disastrous result of that war was due to weakness of faith on the part of the Tibetians or of work on that of the Chinese could not be determined, but the Buddhist priests from Muscovite territory, who began to come frequently to Lhassa, apparently convinced the Dalai Lama that his material and spiritual interests were more closely connected with the Czar of Russia than with the Emperor of China. The English have now been encamped on Tibetan soil for over six months and have met with no armed opposition from Tibet, nor, so far as known to the public, with any diplomatic protest from Russia. Colonel Younghusband's expedition is at Rinchengong, near the village of Chumbi, and can easily reach Gyangtse, 110 miles nearer Lhassa, at any time. So far Jelep Pass has been kept open, and supplies and reinforcements are sent to the Chumbi Valley from Sikkim. The advance guard is now at Tanu, in a territory never before visited by Europeans.

Conditions in Colombia

BY ARTHUR M. BEAUPRÉ

[Mr. Beaupre has just returned from Bogota, where he has served as United States Minister to Colombia. He has resided in the republic long enough to be able to study the character of the people, its resources, the political situation and the effect which United States occupation of the Isthmus will have in this part of the world. Consequently his views at the present time are of unusual interest.—EDITOR.]

THE relations between the United States and the Colombian Republic in the past have been as friendly as have existed between this country and any of the Latin-American nations—perhaps the feeling has been more cordial than in some of the Central and South American countries, and Americans—I am now speaking of citizens of the United States—have in the past been well treated by the Colombians. Personally, I can say that my relations with them during my residence in Bogota have been very pleasant.

If no incident had occurred to disturb the relations in the two countries, I do not doubt but what Colombia would support any policy which the United States might have adopted relative to the Panama Canal, for it may be of much benefit in settling and developing a section of the republic which as yet is sparsely inhabited. I refer to the Valley of the Cauca, which is unquestionably one of the richest sections of South America. It covers a very large area and is located in the western portion of Colombia, extending parallel to the Pacific Coast. The topography of the northern section of South America is such that one portion of the republic may be isolated from another on account of the mountain ranges and the difficulty of the routes. The Valley of the Cauca is set apart, so to speak. The comparatively few people who reside in it are composed of those of Spanish descent, who, of course, form the upper class, while the lower class are negroes and those of mixed blood. Its climate and soil are adapted to the growing of not only corn, tobacco and sugar cane, but other staples which are raised both in the temperate and tropic zones. The soil is extremely fertile but, as yet, a very small area has been made productive. The valley comprises one of the States of the republic, and besides the capital of the State, an old town of Spanish origin, it has two seaports. One of these, Buena Ventura, could be provided with a harbor large enough to float steamships carrying several thousand tons of cargo, but as yet it is merely an open roadstead. The valley at present is separated from the rest of the country, but with the canal cut across the Isthmus it would be brought within a short distance of other portions of the republic, as well as the mouth of the Magdalena River, as its principal seaport is only about ten or twelve hours' run from the western terminus of the canal.

The Valley of the Cauca has very meager transportation facilities and awaits the railroad builder to be developed. If the canal is constructed the Colombians will do but little in settling and developing the country. It awaits American energy and represents a most attractive field for the investment of capital in the construction of railroad lines, as well as in agriculture and industry. A few Americans have already located in it. I recall one who hails from New York. He went there, purchased land, which he devoted largely to coffee cultivation, and, I understand, has become very wealthy.

This portion of Colombia should be referred to in discussing the present situation, for the reason that the Colombians are well aware that it can be developed into one of the most valuable of their States, and they realize how the construction of the canal may benefit them in bringing it into closer communication with their country as well as the United States. Ordinarily there is another good reason for their favoring the canal, as it will give them an extensive

market during its construction for food and other supplies, while it is possible the country may also be drawn upon for labor. The distance to Colon is so short that cattle, for instance, can be shipped by the cargo at a very low cost. During the Spanish-American war South American beef was sent into Cuba in large quantities. They raise a very good quality of live stock in the northern portion of the republic, but this is only one staple which they could sell in quantities for the use of the force employed in Panama.

In discussing the relations of Colombia and the United States considerable has been said about the influence of foreigners who have located in the former country. I do not think their influence is as important as some may consider. It is true that in the sea ports are to be found English and German traders and representatives of merchants and manufacturers from this country, but I am positive that the trade we have enjoyed with Colombia amounts to more when its actual value is considered, than what they have secured; yet most of the business done by our exporters is through agents and they have very few warehouses in the country. In spite of this fact we have been constantly increasing our sales of flour and coal oil, for example. There is no question but what commerce with Colombia could be greatly expanded, especially in the way of machinery and other heavy articles, if there were routes by which the material could be transported into the interior. This is one reason why its mineral resources have been so little developed. The republic contains very large deposits of coal, and some veins of anthracite have been found, but the mining is done in a very crude way. They work the deposit which is most convenient, then take up another which lies near the surface. I know that gold ores are also very abundant, but the metal is found very largely in quartz and must have powerful machinery to extract it. As many of the largest deposits thus far discovered are in the mountains, where everything must be carried on the backs of mules, lack of proper apparatus has to a great extent prevented this resource from being exploited. One mining company, composed of English capitalists, however, has secured very large amounts of gold within the last few years and its success is well known. Railroads are one of the great necessities of the country, and there is no physical obstacle to their construction any more than the engineers encountered in building systems through the Rocky Mountain region. Bogota could be connected with the Pacific Coast by lines running through the Valley of the Cauca, as there are passes from the plateau on which it is located through which railways could be built without presenting too difficult engineering problems.

As to the political situation in Colombia, there is not much difference between this country and some others in Latin-America. It is unnecessary to say that they have had several revolutions, and I am aware that foreign interests have suffered very heavy losses in consequence. Therefore the latter would welcome any Government which would put at end such internal dissensions. But I do not know that the present Government is more stable than its predecessors. General Reyes is perhaps the most popular man in Colombia, with the lower classes especially. It is because the latter have more admiration for soldiers than for any other type of men. He won his popularity by his success in putting down the rebellion of 1895, and since then has been regarded as a sort of hero by the mass of the people, altho he perhaps deserves a greater reputation as an explorer than as a military man, for it is largely due to his investigation that the world knows as much as it does of the northern portion of South America, especially the head waters of the Amazon.

Altho they are liable to fight among themselves, if a foreign nation opposes them sectional differences are forgotten and they unite, making common cause against the enemy. The Colombians are probably as high-spirited as any nation in South America. They entirely control the republic, neither English, Germans or people from the United States having any political influence whatever, in spite of the foreign capital which has been invested. All of the important offices are held by natives, and outsiders are barred in this respect.

Personally, I think the presence of the United States on the Isthmus as the

builder of the canal and its guardian will have a very salutary effect, especially in Central America. The strip of land under our control means, of course, a barrier to future warfare between the people north and the people south of it. It will prevent the invasion of Colombia from the north, and this is something which the Government of the republic should realize in connection with the present situation. Our protection of the canal should also be a benefit to the large foreign interests in the Central American republic, and I believe it means much for the future peace of this section of the world.

WASHINGTON, D. C.

Longstreet and Gordon

BY SILAS X. FLOYD

[General James Longstreet died at Gainesville, Ga., on Saturday, January 2d, and General John B. Gordon died at Biscayne, Fla., Saturday, January 9th. They were the last two Generals of the Confederate army of the rank of Lieutenant-General, the others having long since passed to their rest. They were both Georgians, and are buried in that State.—EDITOR.]

SOLDIERS, from every State draw near,
Sound taps with tear-dimmed eyes
O'er the warriors brave who answered "*Here!*"
To the roll-call of the skies.

For side by side they stacked their arms,
And passed to the further shore,—
No more to start at the sound of alarms,
And to dream of wars no more.

What if they fought on the side that lost,
And not on the side that won?
Forget we now war's holocaust,
And let us mourn as one.

They fought a good fight in the days of peace,
After the days of blood,
And through the years they did not cease
To plead for Brotherhood.

There shall they sleep 'neath Georgia's clay,
Longstreet and Gordon, too,
Mourned by the Boys who wore the Gray
And the Boys who wore the Blue.

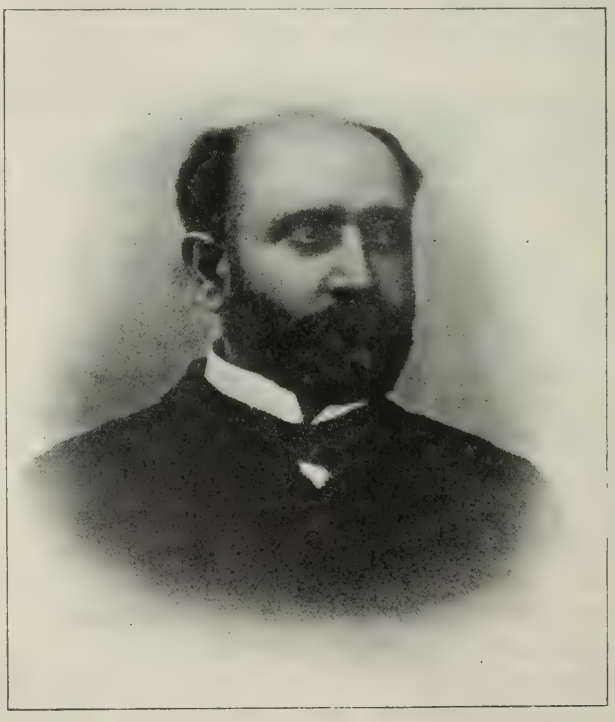
With them the passing years shall prove
That the hatreds of war must die,
And o'er brother hearts in bands of Love
One nation's flag shall fly.

Soldiers, from every State draw near,
Sound taps with tear-dimmed eyes
O'er the warriors brave who answered "*Here!*"
To the roll-call of the skies.

AUGUSTA, GA.

Plans and Prospects of the Spanish Republicans

BY DON NICHOLAS SALMERON



Ex-President of the Spanish Republic

[It may be surprising to most readers to learn that there is now living in Madrid a statesman who for a brief period in the turbulent seventies was President of the Republic of Spain. And now, after all these years, Don Nicholas Salmeron is coming to the front again at the head of another Republican party whose activity is causing significant political disturbance in Spain, and whose steady progress in popular favor causes many far-seeing observers to predict that the present monarchy is doomed, owing to the narrow adherence of young King Alphonso XIII and his mother to the wishes of their priestly advisers. In consequence, the accompanying article in regard to the plans and prospects of his party, by ex-President Salmeron, is of much consequence. The article was written by Signor Salmeron in Spanish, and the translation into English by a correspondent in Madrid was read to him and approved by him.—Editor.]

THE situation of the Republican Party in Spain may be defined in brief terms. The political opinion of the immense majority of the people is essentially republican. All the well educated persons of the middle class are fundamentally convinced of the incompatability of the monarchy with the national interests and aspirations. Besides, the tremendous lesson inculcated by our disasters has made them conceive an aversion to monarchical institutions. Wherever I went, in my journey through the provinces of Spain, I found that the people, who had before harbored royalistic ideas, now felt profound repugnance at the conduct of the monarchy and the consequences of the deplorable period of its restoration.

Therefore it may well be affirmed that the Republican Party can safely reckon with great and firm support, especially in the two important regions of Valencia and Catalonia.

Moreover, the policy pursued by the Liberal as well as the Conservative parties has created in protest an anti-clerical spirit such as was never seen, not even in the time of Isabel II; and if it be added, as is being recognized by all, not only by the Republicans but by those addicted to the monarchy, that there exist influences which are anti-constitutional, obstacles in the current of the liberal spirit and obstacles in the way of international relations, we have united a series of conditions and circumstances which clearly demonstrate that the greater part of the sound and vigorous portion of the country is in conflict with the present *régime*.

DON NICHOLAS SALMERON

It is notorious that the crisis which brought about the actual Government was caused by impositions emanating from the Palace, where a Government was required which, without being scrupulous regarding the means, would be able to defeat the Republican Party at the coming municipal elections.

It is a fact that

the anterior Silvela Cabinet did not fall on account of any dissensions existing among the Ministers; indeed, I have reason to believe that all of them came to a sort of arrangement not to form part of the new Government.

It is also a fact that Silvela, in an interview which a reporter of *El Heraldo* had with him, said something, the meaning of which must be perfectly clear to those who are able to comprehend certain words and can read between the lines. He said that everything might be doubted except his ability of judging of the favorable and adverse circumstances with which he would have to reckon in realizing his plans, and this he could not say because of the votes in Parliament which had accorded him the best and most positive power. He had shown himself favorable to a policy of alliances, but had encountered in the Palace certain and eloquent manifestations against this inclination.

Considering the impositions and unconstitutional tendency which must result from trying to vanquish the Republicans by any means, it will be readily understood that these elections, in which the Republicans intend to proclaim their aspirations, must prove of transcendent importance; and if to all this be aggregated the foolish policy, which, undoubtedly under pressure from the Palace, the Government is exercising against the Republicans, it becomes evident that matters have indeed reached a very serious pass.

The Government of Sr. Villaverde is now prohibiting the use of the word Republic; in all public announcements of meetings or reunions the objectionable noun is blotted out. It would appear that we are returning to the dark ages, in which it was believed that the suppression of a word changed the reality of things. All these stupid measures simply lead to the accumulation of steam in the national boiler, which, for want of a valve, will at length burst, and toward that end we Republicans shall do our best!

The struggle in the approaching elections must have one of the two following results: either the Republican Party will be routed or the present Government will receive a mortal blow, because its very existence is based merely on the imposition from the Crown of which I have previously spoken. Our victory would cause greater damage to the monarchy than that which we incurred in the elections of April. On the other hand, if the Republicans be defeated it will not be on account of the strength of the monarchy, but on account of the corrupt practices and infamous measures, setting the law at defiance, with which certain Governments have been accustomed to obtain their majorities; in which case the Republicans will proceed to violence in order to chastise the ignominious conduct of the monarchy and its Governments. I must forbear to say more on this subject.

The Republican Party is decidedly of the opinion that the policy of the State should have an entirely laical character, and proclaims the independence of all citizens as apart from their religious beliefs. Therefore when we triumph we shall maintain complete liberty as regards worship, but decree the separation of Church and State; and respecting religious associations, we consider them to be contrary to human nature as well as illegal, consequently we shall not grant them more privileges than those enjoyed by associations of a civil character. In this way we shall put a stop to the fatal alliance actually existing between the Church and the Institutions.

The financial regimen of the country depends on the organization of our Institutions. Therefore the Republicans will introduce important reforms, in order to reduce the ciphers of the budget, by a radical modification of the present administration, which is too centralizing and exhausts local energy, choking with its fiscal spirit any useful enterprise. We shall transform the actual territorial organization and frustrate the so frequent concealment of taxable riches. In this manner we can reduce by forty to fifty per cent. the enormous territorial taxes, and, obliging all the wealthy proprietors to pay the imposts which they owe, put an end to the scandalous practice of requiring those whose income scarcely comes to 400 pesetas per annum to pay in the same proportion of 20 per cent. as others who annually receive 100,000 pesetas. We shall also increase the amount destined for public works, which

is so ridiculously small that one-half of the Spanish land is still without roads, railways and any means of communication. At the same time we shall spend more money in public instruction, as we do not wish to imitate the Governments of the monarchy, who tolerate the shameful fact that there are actually 60 per cent. of the population of Spain who can neither read nor write, and 3,000 schools closed for want of masters, some of whom are paid at the rate of sixteen cents per day!

As regards the outlays for army and navy, the Republican Party has firmly resolved to make every possible sacrifice in order that we may have soldiers capable of defending the integrity of the poor land which is still left us, as well as a fleet which is in a condition to protect our coasts, thus avoiding the repetition of the humiliating events of Cavite and Santiago de Cuba.

When we have a really efficacious army and navy we shall actively commence a policy of alliances, which is not to be thought of at present, because we are not now in a position to offer any advantages to the nation to which we might desire to be allied, nor can we to-day make good our indisputable rights over Morocco.

On the other hand, I am of the opinion that the conditions of international policy in Europe have fundamentally changed. I believe that we are on the point of a great transformation in the international policy of the world, and, in my opinion, this transformation was initiated by the attitude adopted, at the saddest time for us, by the United States of America, which has assumed the functions of a universal Power. If here the monarchy had not been restored, the international policy of Spain would have been an alliance with the United States; and such an alliance was contemplated by the Republic instituted here in 1873, with the object that Spain should agree with the United States regarding the situation of the Antilles, and that Spain should follow with the South American republics the policy which, in accordance with the United States, would have served to balance the representation of the different races in the world. Indeed, it would be foolish for the United States to think of exercising in the world a supremacy, to subjugate and annul the other nations, because the basis of its power consists in aspiring to be the first, but with the greatness of the other countries. However, what could not be brought about in 1873, I believe may yet be done. And on the ideas which I have just briefly exposed the Republican Party will base its international policy when the moment of definite triumph comes, thus marking the commencement of the regeneration of Spain. There is no doubt but that in a relatively short space of time Spain will rise from her present prostration and once more occupy in the world the important and honorable post to which her glorious history and the virtues of her children give her the right.

The topographical situation of our country is privileged, its soil is most fertile and it is rich in every class of minerals; and, on the other hand, the intelligence, activity and patriotism of the Spaniards in general are unquestionable. Then what is wanting to make this conjunction of elements and favorable circumstances fruitful to the country? Only a proper administration by Institutions whose sole object is the welfare of the nation—nothing of the present miserable dynastic interests, but the noble and unselfish aspirations calculated to aggrandize our native land by fomenting and developing its riches and elevating its culture in a truly democratic and liberal sense.

The great majority of Spaniards are convinced of this, as will shortly be demonstrated by the events which are rapidly approaching.

Regarding the question of the projected custom house league against the United States, I shall begin by expressing the opinion that we are at this moment passing a great crisis in economical relations.

Spain is to-day in a notoriously inferior situation with respect to other nations, because it almost finds itself in the intermediate position of a semi-barbarous people, which the more cultured nations turn to their profit, and that of a people living at the commencement of civilization. From this deplorable state of affairs it results that, altho we possess enormous national wealth, nevertheless (through the lack of capacity and patriot-

ism of our Governments, as I said before) we do not know how to transform it and turn it to account; so that, instead of obliging the foreigners to become our tributaries with those riches, we deliver them our raw material, which we afterward buy again when it has been changed, thus making ourselves tributaries for that with which nature has furnished us in abundance. I therefore think that it is urgently necessary for Spain to make such custom house tariffs as will constitute a hindrance to the exportation of raw material, in order to oblige the proprietors of the same to transform and elaborate it in our own territory; but Spain should do no more.

To-day the country is in no condition to take part in any tariff struggle or any *Zollverein*, nor could it obtain any advantages thereby.

Before concluding I must declare that I very much doubt whether the projected European custom house league against the United States will ever be realized, because, among other reasons, the powerful North American Republic has plenty of means of throwing obstacles in the way, and so preventing its creation, and will, in any case, be able to avoid its prejudicial effects.

MADRID, SPAIN.

The Japan of 1903

BY THE REV. J. H. DE FOREST, D.D.

MISSIONARY OF THE AMERICAN BOARD AT SENDAI, JAPAN

WITHIN and without it has been a hard year for Japan. In this compact little empire there used to be bad famines, when death by starvation even in the streets of Tokyo was not unknown. But with ports open to the world, and with the easy importation of cereals from China and America, it was thought impossible that there could be any real danger of starvation from failure of crops. Yet the year opened with 150,000 people in three northern provinces absolutely without food of any kind. Aomori Province alone lost $1,900,000 (gold) from shortage in rice, and $700,000 more from other crop failures.

The news of this impending calamity made hardly a ripple in the national mind, for the humanitarian spirit is weak unless backed up by the all-powerful patriotic sentiment. Two years ago in this same province two hundred soldiers perished in a blizzard, and because they were soldiers of Dai Nippon the whole nation was profoundly stirred. The story of how these brave men met their fate was told in every household, and the incredible sum of a quarter of a million *yen* was contributed, rich and poor, men, women and children swelling the sum that was to go to the families of the unfortunates. But when 150,000 peasants were brought to the worst forms of prolonged starvation the apathy of the nation was pitiable, until foreigners in the open ports took it up and made splendid gifts for relief. After a while the millionaires of Japan and then the Emperor made equally large contributions, relief works were opened, and the great majority of these starving people were enabled to continue their existence. This year's crop of rice has brought joy to the land, for it gives the people nearly thirty per cent. more than last year's and eighteen per cent. more than the average.

The rapid increase of rice culture in the United States is attracting wide attention here. The best seed rice of Japan, the Higo brand, has been bought in large quantities for shipment to the United States. This has stirred men of capital here to gather a colony of Japanese in Texas, where they propose to open rice fields on a grand scale.

It may seem of little significance that Japanese and foreign graduates of Yale and Harvard held their first joint meeting in the Nobles' Club at Tokyo last spring. Yet it is impossible to tell what a mighty influence for good these two American universities have had on the national life of Japan. The international value of such university work is beyond computation. To sit around a

table and hear such men as Baron Komura, Minister of Foreign Affairs; Baron Kaneko, Ex-Minister of Justice; Dr. Hatoyama, ex-President of the House of Representatives; Viscount Okabe, Professor Mitsukuri, of the Imperial University; Mr. Ichihara, Mayor of Yokohama; Mr. Yokoi, of the Department of Communications, and others tell of what Yale and Harvard had done for them was not only interesting, it was a manifestation of the real affection these scholars have toward our republic. The welcome Japanese students have received from our universities has brought untold blessings to the Japanese Empire, and will never be forgotten by these grateful graduates.

In startling contrast to this we cannot fail to contrast the lack of welcome with which our nation meets the students from China. The young men of China are beginning to show a deep desire for modern knowledge. But if they turn their longing eyes toward the United States they see the barriers our Government has raised against them and the wide prejudice that makes it almost impossible to attempt university life there. And the result is they turn to Japan. The majority of the thousand Chinese students in Tokyo might have gone to the United States; then twenty years from now they would be exerting an immense influence in breaking down the Chinese hatred of the whole Western world, and there would be glad alumni meetings in Pekin that would mean peace and good will. While we are missing this golden opportunity Japan alone, of all the Powers, is winning the confidence of China, and is becoming her schoolmaster in the arts of diplomacy and war as well as in modern sciences.

This year will long be remembered for its revelations of bribery among those who were regarded as the special guardians of the moral life of the nation—the men who are intrusted with educational affairs. This heavy wave of corruption is known as "The Text-book Scandal." Teachers, superintendents of education, governors and even members of the nobility were implicated. Some took bribes straight and had the text-books adopted in their spheres of influence. Others were benefited indirectly, with no thought of ever being discovered. One after another was ferreted out in different provinces and put under arrest. The principal of twelve hundred boys just across the road from where I am writing was one, the principal of five hundred girls on the other side of this city was another, and then the Governor himself was arrested, tho after several months he was released. Before the year was half gone scores of these prominent men were brought to trial, and the large majority were sentenced to fines and imprisonment, with confiscation of the bribes.

Had so wide an exposure taken place in mercantile circles only, everybody would have taken it as a matter of course, for commercial morality is much below par. But to have men who were especially intrusted with the moral education of the youths of the nation publicly tried and convicted and sentenced as criminals was a shock to those who believed that Japan's ethical teachings of loyalty and filial piety were as efficient for to-day as they were for Old Japan. Four years ago, in an address before a thousand teachers, I ventured to say that good as were the principles of loyalty and filial piety for the development of semi-civilized people under despotisms, they were not sufficient for the strain of representative government and international intercourse. For this remark I was interrupted with vigorous "No, No's" from about one-third of the audience, and was posted in many papers as a subverter of the especial virtues that have made Japan great.

But when a nation, whose laws, customs, morals and religion were all directed by the State, makes the sudden and vast changes of separating religion from government, and morals from law (and Japan is the only nation that has ever dared such an immense experiment at one stroke), it is inevitable that, with equal rights before impartial law, and the force of caste broken, there will be manifestations of weakness in morals (which now have become individualistic) that alarm all lovers of righteousness. One of these gifted moralists, the successor of the great Fukuzawa as President of the Keio University, thus gloomily sums up the moral situation in a public address in Tokyo:

"It looks as though corruption covered

every part of public works and education, so that children in leaving their homes to go to school must tramp over roads constructed by bribery, must cross bridges built by bribery, must enter school buildings erected by bribery, and while reading the regulation text-books their teachers are arrested for bribery!"

Yet we must remember that the religious and ethical systems that fostered the moral life of Old Japan are by no means dead, and that there is still a love of righteousness that will not shrink at sacrifice to defeat evil. There is no doubt but that this exposure of corruption where it was least expected has made it easier to look with favor on universal standards of morality, and to feel the need of a religion that develops the sense of responsibility on the part of the individual. Three of Japan's great statesmen, Counts Okuma and Aoki and Baron Maejima, have recently given public expression to the need of a religion, by which they mean Christianity.

It may be well here to notice the prime cause of the lack of commercial morality in Japan. I have often been asked why a Chinaman's word is as good as gold, while that of the Japanese is worthless. There are some who ask with more discrimination: "Why is it that in China a merchant is thoroughly reliable and the officials very corrupt, while in Japan the officials are all right and the merchants cannot be trusted?" Surprise is often expressed that the two nations are so different in commercial matters. The reason is perfectly obvious. Both nations were developed under Confucian ethics, the center of which is the five relations of parents and children: lord and retainer; husband and wife; brothers and sisters; and friends. China emphasized the relation of parents and children, with its correlative of filial piety, as being of prime importance. The family is first, and whatever tends to give it permanence and prosperity is honorable. Since commerce builds it up, it is an honorable calling demanding trustworthy methods. This is why the Chinaman is commercially reliable. The experience of ages has evolved the honest Chinaman in a calling that brings no disgrace.

When, however, the Confucian ethics came to Japan, about a thousand years ago, already the military spirit was in the ascendant, and so the order of the two leading relations was reversed, and that of lord and retainer, with its correlative of loyalty, took the highest place. The State was everything, and those whose courage and fidelity made strong the foundations of the empire were the honored class. Loyalty and learning made the two-sworded Samurai, and they made Japan. The virtues of the warrior are readiness to sacrifice his family, his life, everything for his prince; love of righteousness, simplicity of life, and dislike of money, with its corrupting and enervating temptations. Hence the merchant, with his soft life, was put at the very bottom of the social order, and came to be despised as one who valued money above all things else, and who would lie for gain. Ages of social contempt have developed the Japanese trader, and while there were a few mercantile houses like the Mitsuis, whose word was as good as gold, and is now, they were the exception. This is the largest factor in the explanation of the present commercial discredit of Japan. But any one who knows the people knows that this evil will mend. Mercantile education now embodies ethical training on universal lines, and now there is noticeably forming a public opinion that will be a strong corrective. The bad reputation of Japan in commercial matters is simply temporary. The nation that can withstand the vices of the West and the worst evil of the East, opium, and that can adopt and adapt whole strata of our noblest traditions in government, law and education, is not going to be wrecked by the low commercial traditions of her once bottom class.

That the exposure of so much corruption in high places and the rumors of rottenness in the various grades of society should arouse earnest warnings is natural. It is also natural that these manifestations of evil should make pessimists of many sincere people, and perhaps this is one cause of the discouragement and despair of many earnest students who inherit the old love of righteousness, yet who have no hope of its success. At any rate it has been a year memorable for its sad suicides among gifted young men who have drifted into the conclusion that life is not worth living. The beautiful Kegon waterfall just above Nikko is the place that has been

made famous by these successive self-destructions, until at last, when over a dozen students had thus perished, the place was put under guard and notices posted by the priests near there that thus to throw away precious life is to defile the sacred mountain, is irreverent toward the gods, disloyal to the Emperor and disobedient to parents. To this should be added this bit of Western advice: "Suicide is the meanest, smallest, silliest back door through which a man ever shirked his difficulties."

These and other grave problems of the year have brought Japan face to face with moral questions that demand early and serious attention. Her thoughtful leaders are quietly saying that just as the nation met the great political and social revolution of forty years ago, so now they must recognize the coming spiritual revolution that shall give to the individual moral power, and that shall quicken the conscience. The word *personality*, hitherto unknown in the languages of the pantheistic East, has already gotten a deep hold here in public addresses, in magazines and in educational circles. "It is the coming moral word," said a principal of a large school. Japan seems to be on the eve of as great a spiritual awakening as England had in Wesley's day, tho it will not be on that style. Borrowing much from Christian thought, and putting richer and wider meanings into their traditional ethics, the Japanese will come out of the present moral slump with as great an advance as they won politically and materially by the Restoration of 1868.

But how about the Katsura Cabinet, Marquis Ito and his party, the numerous diets of this year, and last, but not least, the Russian problem?

General Viscount Katsura's Cabinet, that with difficulty was formed in June, 1901, after weeks of consultations and delays, was at that time felt to be a mere makeshift, and the public would not have been surprised had it fallen in three months. But it stands, and it promises to have the longest life any Cabinet has yet had. It has bowled out two Diets this year, and the last one that met a few days ago beats the record. It existed but a few hours, for the new President, Mr. Kato, in his reply to the Emperor's usual opening message, embodied severe criticisms of the Cabinet, and for that the House was at once dissolved. It would seem that with the country face to face with the Russian problem, the House would have acted with sobriety. But their long trusted President Kataoka recently died. The large Constitutional Party that Marquis Ito headed proved too intractable even for Japan's greatest statesman, who resigned his leadership last summer. So when the House came together the one controlling idea of the majority was to force the resignation of the Katsura Cabinet. Instead of winning, they all find themselves sent home minus their $1,000 salary, and with the chilling privilege of spending another $1,000 in the chance of getting themselves re-elected next March. It is bad for representative institutions in Japan, and this bad policy is likely to go on in the future. When this contest for party cabinets and these obstructive methods on the part of the House, followed by repeated dissolutions, will end, no one can tell.

As for Russia, ever since she so kindly advised Japan not to hold Port Arthur, and then stepped right into that stronghold herself, she has been nagging Japan ceaselessly. Her diplomacy has been equivocal and false. Her unfulfilled promises have surprised a good part of the world. On the other hand, Russia has a great railroad line through Manchuria, and such railroads tend to carry with them the right of wide control to the nation building them. "Conquest by railroads," rather than by war, is a new and recognized method of international movements. The strain upon Japan, however, has been intense, and it is a marvel that her Cabinet, headed by one of Japan's great generals, has kept its course so evenly and has been betrayed into no hasty nor undignified acts, nor has its diplomacy been smeared with deception. The oft repeated telegrams in Western newspapers to the effect that peaceful solutions were in sight have been misleading. It has been a year of most serious danger of war. If the Katsura Cabinet can solve this question peacefully and with honor, it will have brought blessings to the whole East, perhaps to the whole world.

SENDAI, JAPAN, Dec. 23, 1903

My Friend Whistler

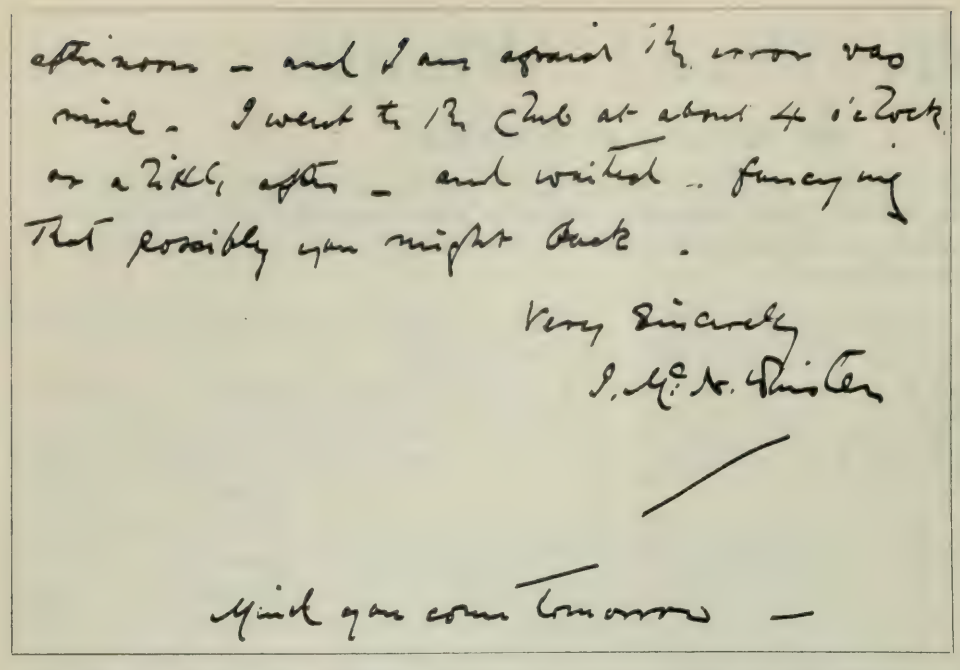
BY EDMUND H. WUERPEL

[The well-known artist who makes the following tribute to his friend has exhibited at the Paris Salons and the Paris Exposition, where he was a member of the National Art Jury. He was also Corresponding Secretary of the American jury in Paris for the Chicago Exposition.—EDITOR.]

MY copy of the portrait in the Luxembourg was all but finished. I had stepped back to get a final view of it when the figure of a small man, in a tall silk hat and long black coat, came between me and my canvas. He carried a slim stick in his hand, with which, from time to time, he nervously tapped the floor. I grew impatient over his prolonged interest, and longed for him to pass on. Finally he turned to me with a most winning smile, saying in French: "This is not so bad, young man; it shows a sympathy with the artist and a certain conception of his method. I wish you success." And still smiling, he turned away, leaving me in a curious frame of mind.

A Card Sent by Mr. Whistler to the Author
Copyright, 1903, by THE INDEPENDENT

When, a few days later, a matter of business connected with a loan exhibition brought me an invitation to call upon Mr. Whistler, I naturally blessed the opportunity. Imagine my surprise, then, on seeing my little man of the Luxembourg seated at a table bestrewn with papers and drawings. He knew me instantly, and, rising to greet me, he said: "So it was *you* whom I spoke to the other day about my mother's portrait."



Thus began my acquaintance with Mr. Whistler.

I do not know whether it was the lucky accident of the copy I was making, or an instinctive sympathy, or the natural amiability of the man, which procured me his friendship; whatever it was, the friendship grew beyond my fondest hope, and continued until death ended it a few months ago.

I had heard much of Mr. Whistler's eccentricity of character, and was at first continually on the alert for some manifestation of it. But this feeling left me after I really came to know the man, and I have never questioned that my conception of his character was the correct one.

The world at large knew him as an affected, tho brilliant, mountebank. They looked upon him as a man devoid of generosity, of loyalty, of affection, and, in fact, devoid of all that makes a man lovable to his fellow man.

He was, in truth, human, like the rest of us, and burdened with some of our weaknesses. It was unfortunate for Mr. Whistler, and still more so for the public, that in the very beginning of his career he should have been unfairly and unreasonably treated. All

Conclusion of a Letter Showing Whistler's Consideration for His Friend

his sensitive nature rebelled at the narrow, prejudiced conception of his efforts, and his indomitable will refused to accept quietly the verdict of a philistine. Had Mr. Whistler been a man of large, robust physique, had he been a man of greater physical strength, of a less nervous temperament, it is extremely probable that we should never have heard of the Jimmie Whistler of the press. He would have been able to pass quietly to his chosen place without those unfortunate outbursts for which the worry of his tormentors are responsible. Would this in any way have affected our opinion of his art; would he have had more popularity?

From the very beginning I was fortunate in gaining Mr. Whistler's friendship, and thus knew him as I wish that everybody might have known him.

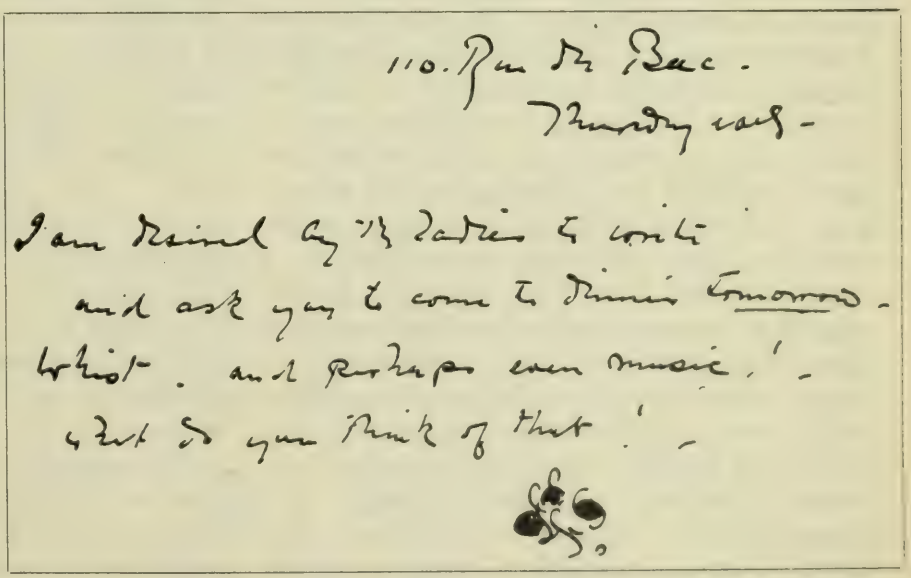
He was a man full of that experience which fosters an understanding of the troubles and trials of others. He knew how to comfort, not by flattery, but by encouragement. He had such a vast fund on which to draw that he was seldom at a loss to illustrate his meaning from his personal experiences.

"It is absurd to be discouraged," he would say, "for you need every bit of cheerfulness and strength to go on fighting the battle. If you could but know the number of times, even now, when I have *almost* given up, you would not feel so desperate about your own case."

His appreciation of his own achievements was naïve. His pleasure in something well done was childish, at times almost pathetic. He would work incessantly at some detail on his canvas, and when it was finally accomplished to his satisfaction, would enjoy it in an absolutely impersonal manner. "Now look at this!" he would exclaim, "isn't it pretty; see how soft it is, *isn't* it pretty, what!" And not waiting for a reply, he would actually dance from one side of his studio to the other to see it from different points of view, always keeping up an analysis of what had been achieved,—not what he—Whistler—had achieved. It was as frank, spontaneous and joyous as the lark's note of praise. So he would enjoy his triumphs.

He knew his own worth perfectly, and was as free in his adverse criticisms as he was in his praises. I remember well his asking me to pose for a study which we called the Scotchman. "I am tired of doing an unsympathetic model. All they consider is 'Am I going to get the worth of my money, or am I being done justice to?' I want to work at some thing that breathes sympathy and encouragement. Will you do it?"

Oh! the delightful hours of talk and advice and mutual reminiscences. He told me of his early life and of his student days. I have no room for that here. He showed me that truly gentle, lovable nature which, alas! only too few knew. He would work and talk joyously while things went well. But when he could not accomplish what he was striving for he was silent, and occasionally his little foot would tap the floor impatiently. His lips, usually so happy and smiling, would become stern and straight, and his human model was forgotten. I have under



such circumstances posed for him for three hours without a rest, and on one occasion nearly fainted under the strain of it. You should have seen his bewilderment when he realized what had happened. You should have heard the gentle apology and seen the solicitous concern with which he hovered over me until I had recovered. It was worth ten times the pain and strain. Occasionally he would call me to see what he had accomplished, or to ask my advice, as to the merit or demerit of some detail.

One day he had completed a sleeve and I was asked to admire it. It had a fault in drawing, not unusual in his first steps. Upon my pointing it out to him he deliberately scraped out the painting, and it had all to be done over again. When it was finally drawn to his satisfaction, he could not get the color. He worked and frowned and struggled, and finally putting down his brushes, he said with a sigh: "My dear fellow, why *did* you make me change it. I *had* it, man, and just see now!"

In his discouragement, as in his wrath, there was always one restraining element—his wife. No one can have a correct impression of Mr. Whistler's personality without knowing him in his own home. Mrs. Whistler was of an even cheerful disposition, never betraying the worry and anxiety to which Mr. Whistler's unhappy outbursts subjected her. Her tact and calmness, her full appreciation of the causes which moved her husband, were the means of quelling many an incipient demon of scorn, sarcasm and vindictive wit. She seemed instinctively to know when things were going wrong. If it was merely a question of discouragement she would endeavor to change the current of his thoughts. His interest in their garden was as keen as her own; and it was an easy matter to coax him out in the cool evening air and divert his thoughts into more agreeable channels. In his roses lie buried his troubles. If the weather was inclement, his interest in household matters could successfully be aroused. The hangings, the furniture, the arrangement of all the little trifles which go to make up a home, were of greatest moment to him. His constant plea was for simplicity. So in this way his discouraged spirit was fortified. But if the trouble was of deeper moment, if the spirit was *wounded*, then no ordinary trifles would suffice to change the current of his thoughts.

The motherly tenderness with which she stroked his head, the endearing tone of her voice as she whispered words of comfort, usually soothed him, and often I have heard him answer to her: "What is it, Jimmie, dear?" "Isn't it a beastly world, Trixie?" It was always the Philistine who wrought havoc with his peace of mind. Every sensitive spot of his nature was open to receive the blows unjustly hurled at him. It was a fault, but he was so constituted, and there was no help for it.

Mr. Whistler's home life was harmonious, happy and companionable. It was my very great pleasure and good fortune to have been made one of the family, and I cannot sufficiently express my delight in the relations that existed between Mr. Whistler and the rest of his household. His pleasures were simple and easily gratified. His love for music was not of a profound

A Card Showing Whistler's Butterfly Signature

nature. He preferred the old ballads and sonorous symphonies to the subtle melodies of Grieg. "He is too depressing," he would complain—"I like something that has more movement." But once aware of the taste of others, he never interfered with their pleasures. He would sit patiently, while Mrs. Whistler and her sister, Miss Philip, played or sang to me, until some fitting opportunity occurred, when he would mildly suggest that we play a game of whist to make us happier.

The mysteries of clairvoyance had a great attraction for him, and among other frivolities we indulged in was table rapping and mind reading. I remember with what indignation he accused Mrs. Whistler of moving the table one evening when that innocent piece of furniture was actually dancing from one end of the room to the other. "Why, Trixie, you do not seem to realize that I am actually in earnest, and that I should like to investigate this phenomenon seriously." I procured the address of a palmist for the ladies, and this visit was the means of an entertaining series of experiments on Mr. Whistler's part. He could not conceive that others should be endowed with supernatural faculties which were denied to him.

At the table his stories and recollections were a never ending source of entertainment. Mrs. Whistler and Miss Philip were led to believe all sorts of ludicrous tales of American life and manners, and I was called upon, in the most solemn manner, to corroborate his statements. For instance, he said to me one evening at dinner: "How would you like some buckwheat cakes, now, with good New Orleans molasses?" Upon my dilating on the pleasures of such a delicacy as only an exile can do, Mrs. Whistler said that if I could tell her how they were made she would try to persuade the Empress (so the cook was always designated) to make them for us. When the recipe was found and the cakes appeared, Mr. Whistler made a great heaping pile of them, flooding them with syrup. He insisted, since the ladies would not take more than a taste, that we two finish them. In reply to the horrified expression on Mrs. Whistler's face, he said smilingly: "Why, Trixie, the Americans *always* eat a dozen of these for breakfast, don't they, Wuerpel?" They nearly got the better of me, and I do not think they agreed with Mr. Whistler, for we never had them again.

As a host, Mr. Whistler showed his guests equal politeness, but not always equal cordiality. Firm and loyal as he was in his friendships, he could not easily take up the threads of an interrupted relation. His first instinct in meeting people was friendly, but he almost invariably discovered the curious and inquisitive, and from these he shut himself in a courteous, but impentrable armor.

On Sunday afternoons it was his custom to receive, either in his house or in that delightful garden behind the house, which has become so familiar to the public. Here, seated at a rustic table, Mrs. Whistler dispensed tea and and good cheer, and here Mr. Whistler walked about incessantly from one visitor to the other; a joking word with one, a word of advice to the other, a serious discussion with the third,—the life of the whole affair. Here I have met Puvis de Chavannes and so mnay of his contemporaries. Here Monsieur M—— would recite us his beautiful couplets—after the other guests had gone. Here I met Dr. Weir Mitchell, Mr. Howells and all the interesting and notable men in Paris.

Some of these men I visited with Mr. Whistler, and never have I seen the slightest trace of that Jimmie Whistler, of which the public has become so fond. He invariably met with the greatest courtesy and distinction, and his opinion was treated with every mark of respect. He was ever ready to advise, when his opinion was asked in evident earnestness. Many young students, of all nationalities, came to him for advice; and I am sure always left his presence enlightened and encouraged. His inferences were not always correct, for he was in the habit of placing himself in the student's place, but I do not think that he ever gave advice that would do harm, no matter under what error of judgment it may have been given. His generous help has kept many a student

from actual want. I am not divulging any great secret in saying that the supply of this world's goods was not always abundant in his coffers. He enjoyed good living; his temperament needed it. But he never refused to share his crumb with any one who really was in want. In one instance he discovered an elderly lady who had foolishly wandered to Paris in pursuit of art. She made copies in the Luxembourg which, at least, gave her pleasure. Her small income was entrusted to friends, who either carelessly or criminally misappropriated it. With the news of her lost fortune came also the news of a daughter's dangerous illness. The poor lady was in despair, and knew not where to turn for help. The American Consul could not help her. Her artist friends were not much more easy in mind than she was herself. In this emergency Mr. Whistler, with the greatest possible delicacy and secrecy, bought her transportation, and sent her some money to defray other expenses upon landing. She did not know of Mr. Whistler's part in the transaction, and had absolutely no claim on him.

It was not only his money he was ready to give, but his more precious time. In my own case he made it a practice to climb up eight flights of steep polished stairs to my apartments, if I can dignify them by such a name. Once a week always, often three times a week, he would come to see my work and criticise it. I cannot recall that I ever asked him to do it. It was done at some expense of personal fatigue and time, and in the most generous, patient, delicate manner imaginable. He never left behind him the sense of a favor conferred. He gave *himself*.

At that time I used to be my own housekeeper, did my own cooking and dish washing. This never ceased to amuse Mr. Whistler. In his student days he had never done the drudgery, and he could not see how it was possible for me to do it. He treated it as a great joke at first, and then fearing he might hurt my feelings, he used often to come about dinner time and sit with us while we ate our homely meal. He would never join us, but was deeply interested in the processes of evolving the wonderful dishes which we concocted. He would go into my little hole of a kitchen and poke into the pots and snuff at this and at that, and say: "Why, God bless me! how do you know what you are about?" And while my chum and I washed the dishes he would lie down on the sofa in my room and take a nap. When all was cleared away he often said to me: "And now, my dear fellow, come home with me and get something to eat."

His frank criticism of the work of other great painters was a constant pleasure. He would go through the Louvre or the Luxembourg with me, full of praise for one and silent contempt for another.

His influence need not be discussed. It is too readily conceded. He felt it and frankly lamented that some should try to follow where he led without having had the necessary preparation. When something came before him that was really good, he was lavish in his praises. Some of the modern phases of art were beneath his notice. I remember meeting him one morning after he had paid a visit to Monet. He was full of praise of the hospitality and kindness of his host, and in some accord with his theories, but he said: "Imagine my surprise on looking out of my bedroom window the morning after my arrival at seeing that the landscape was not full of dots and points of pure color. I felt as tho M. Monet had moved into a saner region." His theory of simplicity could not possibly cover the erratic movements of Monet and his followers. In a like manner he would dwell on the excellencies of the old masters. He studied them minutely, and analyzed not only the result they obtained, but the conditions under which they were produced. He seemed to feel that there was much in "artistic environment and atmosphere" of which so much is said. "They lived at a time when every grain of artistic feeling was coaxed and fostered into activity."

Strong in his convictions, clear in his purpose, and courageous in his labors, he necessarily demanded much from his co-workers. Where these qualities were manifest, he was broad and gen-

erous, even tho the result achieved was mediocre. He apologized for its weaknesses and praised its honesty of purpose, " for without a real cause, no man has a right to work; no one should presume to trifle with so sacred a thing. If you are sure of yourself, let all the world be against you; it should not turn you from your purpose. Only time can tell whether they are right or you are wrong. The reward that comes to us cannot be measured by any other mortal, and it is worth all the sorrow and disappointment." So he would talk, and his example was always before us. The wit, the satirist, the buffoon, the mountebank, had nothing in common with this man.

Of his art, we cannot say much. We feel it, or we do not. Time will place it in its proper relation to all things, and the judgment of time comes not in our days. But the man, stripped of his genius and his greatness, is before us, and should be understood, for we do not often meet with such a personality. Had he never been famous, I am sure that his *friends* would have worshiped his memory even as they do to-day. It was neither his fame nor his brilliancy that drew them; it was simply that dear man, my friend Whistler.

The Anglo-French Arbitration Treaty

BY HAYNE DAVIS

[Mr. Davis is a practicing lawyer in this city who has made a special study of arbitration and kindred international questions. Our readers will remember a very striking article we printed from his pen in our last summer's Fourth of July issue, entitled " The Outcome of the Declaration of Independence." In view of the Conference held last week in Washington for the promotion of arbitration between England and the United States, this article is specially timely.—Editor.]

JUDGED by itself, or in comparison with other arbitration treaties, the Anglo-French Treaty would be a disappointment. But, judged justly, in connection with and in the light of the past, it gives new hope to even the most exacting of the devotees of peace.

In comparison with a number of other general arbitration treaties it is manifestly inferior. In the first place, it runs for five years only, whereas other treaties run for ten years. In the next place, this Anglo-French Treaty can have no force after the expiration of five years, whereas other arbitration treaties remain operative for each successive decade, unless denounced by one of the signatory Powers six months before the end of the current decade.

When a proposition to limit armament was suggested at The Hague Conference it was contended that there were insurmountable obstacles to such an agreement, and European nations have been unable to make any such agreement. But Chile and the Argentine Republic surmounted the supposedly insurmountable obstacles by simply agreeing that neither of them should increase naval expenditures for five years without notice to the other, or make use of war vessels then in course of construction, or sell them to any nation having a controversy with the other. And it is in consequence of this agreement that the sale of battleships by Chile recently took place.

In the next place, while purporting to be an obligatory arbitration treaty, the Anglo-French agreement does not specify any class of controversies as triable by arbitration alone, and contains a clause reserving certain classes of questions for trial by war, and this reservation is so indefinite that it practically destroys the obligatory character of the treaty. The questions reserved for trial by war are those which affect the independence, the honor, or the vital interests of either of the signatory Powers, or the interests of a third Power. Questions affecting " na-

tional honor" are reserved in one of the South American arbitration treaties, signed by ten parties and already ratified and made effectual between three of them (Mexico, Guatemala, Uruguay). But it has the merit of specifying that certain questions do not affect national honor—namely, boundary disputes, the validity, construction and enforcement of treaties, rights of navigation and diplomatic privileges.

It is a notable fact that South American nations were not invited to The Hague Conference and are yet the first to bring forth arbitration treaties, and that their treaties are more perfect than those of the proud nations that expect no good thing in government to issue from South America. The Hague Conference had hardly begun its deliberations before a compulsory arbitration treaty was signed by the Argentine Republic and Uruguay. It bound the contracting Powers to submit to arbitration all controversies that might arise between them, except such as contravened the constitution of either of them. This treaty was signed June 8, 1899, and on November 6th, 1899, a similar treaty was signed by the Argentine Republic and Paraguay. As these treaties contain the best reservation clause so far evolved, the exact wording of the Argentine-Paraguay Treaty is given below:

"Article I.—The high contracting parties bind themselves to submit to arbitration all controversies of whatever nature, which for any cause may arise between them, and which do not affect the provisions of the Constitution of either country, etc."

This reservation is manifestly superior to that contained in the Anglo-French Treaty.

Before exchange of ratifications of these treaties took place the text of the Treaty of The Hague was made public, and its clause for the selection of arbitrators seemed to the South American nations better than the corresponding clause in their treaties previously negotiated. And these treaties were amended so as to contain The Hague Treaty clause for the selection of arbitrators before they were finally completed by exchange of ratifications.

The Argentine-Uruguay Treaty became effective January 18th, 1902, the Argentine-Paraguay Treaty, June 5th, 1902, and in the summer of 1902 Chile and the Argentine Republic entered into a treaty with substantially the same reservation.

These treaties run for ten years, and for each succeeding decade, unless denounced six months before the end of every current decade.

A number of other arbitration treaties between South American nations are worthy of note, but these are sufficient to show that South American nations are in the lead in the arbitration movement. They were first to bind themselves to arbitration, they were quick to recognize and utilize a clause in The Hague Treaty which was superior to their clause on the same subject, and their treaties are the least defective. They share with Spain the honor of binding the Old and New Worlds together by an agreement to arbitrate differences. Spain has signed a general treaty of arbitration (containing a reservation like that in the Argentine treaties) with nine South American nations—Argentine, Bolivia, Colombia, Guatemala, Mexico, Paraguay, Salvador, Santo Domingo and Uruguay.

The South American treaties are between nations of the same race. The Anglo-French Treaty, besides being entered into between different races, is a proof of good will between two nations that have desired in the past to "feed fat the ancient grudge they bore each other." And this fact gives it great value. Now that England and France have emerged out of national animosity of such long standing, the dawn of a better day is certainly near at hand. The first decade of this century will be the spring-time of arbitration. The various nations will be like the trees at different elevations as you ascend a high mountain. When leaves are spreading in the valleys at the base the buds are bursting higher up, and near the summit there is no sign of life. But we know that it is only a question of time when the whole mountain will be one mass of foliage. The nations that are frozen most severely in the winter of national animosities will be last to adorn themselves with the beautiful garments of arbitration, but none will be able to resist the spirit of justice and right which is working out this development.

Having entered into an arbitration

treaty with her ancient enemy, England, France will some day be ready to do the same with Germany, her latest enemy, and it is authoritatively announced that she is now negotiating general arbitration treaties with several European nations, and that Baron d'Estournelles will soon visit the United States and discuss arbitration with our law makers. Baron d'Estournelles should find the United States ready to enter into an arbitration treaty with France perfect enough to become the model for such agreements, and really also to become the center for the extension of arbitration throughout the world. It must not be forgotten that France assisted in the delivery of the United States from the dominion of England, then threw off the shackles of monarchy, then shook every throne in Europe, and so enabled the people of South America to win their independence. After the South American Republics had established their independence the United States threw around them a protecting arm, in order that they might work out for themselves the problems of government.

Monarchical Europe looked upon all this as anarchy, but in less than a century the South American nations, born by the aid of France and reared under the protection of the United States, come forward with a remedy for international anarchy which is appropriate to the hour. In view of these things it is peculiarly fitting that France and the United States, as parents of these republics and as the great representatives of democratic government, should be quick to apply in their relation with each other the wisdom revealed by their children. The outcome should be an arbitration treaty between France and the United States more perfect than the Anglo-French Treaty or the South American treaties.

Certainly any arbitration treaty executed between England, or France, and the United States should be the most perfect so far evolved. In considering the substance of such a treaty it is well to bear in mind the fact that nations may have controversies over questions of fact or questions of law. The destruction of the "Maine" raised a question of fact between Spain and the United States—namely, whether the explosion was within the "Maine" or from an explosive placed in Havana Harbor. We all remember how this question of fact was passed upon. The Venezuela case, now before The Hague Court, furnishes an instance of an international question of law. Are the blockading allies entitled under the law of nations to priority of payment out of the Venezuelan customs duties set aside for payment of her debts, or do all nations share *pro rata* in this fund?

The distinction between questions of fact and of law is important because, under their treaty, France and England are free to resort to war in any question of fact, and are bound to arbitrate questions of law, unless they involve the independence, vital interests or national honor of one of them or the interests of a third Power.

The Treaty of The Hague, to which France and England are parties, provides for a Commission of Inquiry to try questions of fact; but either Power may appeal from a decision of such a commission to the arbitrament of war. Therefore, if France and England submit a question of fact to the Commission of Inquiry, they can appeal to arms after the decision. If they submit a question of law, they are bound to abide by the decision, and they are bound to submit such questions unless they fall within the excepted classes. The Powers signatory of the South American treaties, before alluded to, are bound to arbitrate questions of fact and questions of law, unless they affect the provisions of the constitution of one of the parties concerned, and are bound to abide by the decision in every controversy. In this connection it is important to remember that, since our Declaration of Independence announced the doctrine that every nation has a right to organize itself in such form as its people prefer, and to alter their constitution at will, this principle has become a recognized rule of the law of nations. And any international court would be bound by this rule of law as absolutely as our courts are bound by the laws of the States and of the United States. In deciding any question which involves the right of a nation to adopt such constitution as its people prefer, and to amend it at will, The Hague Court

would be bound to give judgment for the nation contending for this right. Only by a corrupt or manifestly unjust decision could this right be denied.

If questions affecting the independence or autonomy of any nation were included in those which must be submitted to arbitration, but with the right reserved of appealing to arms in such questions after the decision by the court, this would be an improvement on the South American treaties and on the Anglo-French Treaty. It would be an improvement on the South American treaties because all questions would be triable by the court in the first instance, and resort to force would remain in a case involving the constitution and internal affairs of any nation. Independent autonomy would therefore be protected by the honor of The Hague Court and by the power of each nation; whereas under the Argentine reservation the power of each nation is the sole protector of its independence and autonomy, and The Hague Court the sole protector of all its other rights. International relations under such a treaty would be better than that which exists between France and England under their arbitration agreement and the Treaty of The Hague, because this would necessitate the submission of all questions to arbitration in the first instance, with right reserved of appealing to arms after the decision in the most vital matters, whether of law or fact; whereas at present France and England are free to submit questions of fact to the Commission of Inquiry, and appeal to arms after the decision, or to resort to war in the first instance; and free also to resort to war in a number of questions of law which are so vaguely stated as to be incapable of clear definition.

New York City.

The Southern Man

[The following article is by a Northern woman now for several years a resident of the South. She is the author of the much discussed anonymous article we printed some time ago, entitled "Free Speech in the South," which she claimed "didn't exist." Therefore she fears to sign her name to this article. We expect to print a reply from a Southern woman in our next issue.—Editor.]

An amiable critic of "Northern Men and Women," writing in The Independent some months since, expressed the opinion that the men of North and South were much more unlike than the women. Had this writer's sojourn in the North been longer she would, I fancy, revise her statement that "American women are essentially the same everywhere;" for Southern femininity presents certain striking peculiarities so nearly universal that they may justly be called typical, and one need not go far beneath the surface to find that its aims and ideals—its whole conception of the "chief end of man," in fact—are fundamentally different from those of Northern women. But when it comes to the classification of the Southern male, strict accuracy seems to demand the employment of a number of sub-heads. He is in a process of evolution, whose advance has been so various in different professions and localities that your opinion of his likeness or unlikeness to his Northern brother depends much upon the stage of development reached by the particular specimen which you have taken for study. If the only kind of Southern man at present existing were the one who has always been kept most before the public eye it would be an easy matter to tabulate the distinguishing characteristics of the "gentleman of the old school" and his younger counterpart, easier still to make merry over his peculiarities as they strike a woman reared amid the less exaggerated types of the Yankee and the Westerner. And it is a curious revelation of Southern tastes and ideals that, out of all the masculine material at hand, fiction, political oratory and even daily

conversation instinctively choose this traditional hero alone for exhibition and endless glorification, until it is not surprising that among outsiders the impression generally prevails that Dixie is populated exclusively by bombastic gentlemen, whom one Northern man characterized to me as "wild-cat orators with false standards of honor," and that especially the fields of politics and journalism are open to men of this sort only.

Yet I suspect that even the Southern editor is in his unofficial capacity an amiable and comfortable person, and that his fire-breathing editorials, as well as his impossible gush about the sanctity of womanhood, are partly his necessary political stock in trade and partly a survival of that hard-dying Southern conviction that to lapse in his vigor in the maintenance of this peculiar literary style would be to be untrue to his traditions and his ancestors. For almost every Southern man, if you stir him up, can roll out a few periods upon these sacred subjects, but not every one is perpetually on the aggressive with them. So that these and similar manifestations which clamorously demand attention may, after all, be pronounced nothing more vital than a sentiment, which the Southern man *thinks* it a hallowed charge to keep forever burning, but which in reality smolders rather low, except where environment and the exigencies of his calling compel the keeping of it at white heat.

The man thus circumstanced is daily making such a revelation of himself in his books, his newspapers, on the stump and lecture platform that he is already well known to the American public, and it is in view of this fact, rather than because I underestimate his numbers or his influence, that I lay perhaps disproportionate stress upon my second and third subheads, which I should classify broadly as the business man and the college professor. Not that the scope of Southern professions is narrowed to cotton and sugar and pedagogy, but because the college professor represents the highest development of the type of mind predominant in his class. He may be doctor, lawyer or—less frequently—clergyman, but he is distinguished by being *really* educated enough not to let others do his thinking for him. And this counts for more in his case than in that of the Northern man of similar intellectual caliber, because he is the result of new conditions growing out of a great social convulsion, while the latter has developed from what his father was to what to-day's problems compel him to be, with no very marked breach of continuity.

The college-bred men of the older South—one may meet them yet—were as scholarly perhaps, certainly as gifted intellectually by nature, as the aggregate of their sons, but across their lives is drawn a line which effectually confines their reasoning within the bounds of their sympathies and their prejudices. It means much that the descendants of such men have in some instances been able to overleap these barriers of sympathy and prejudice so incredibly strong, and to believe other than their fathers did. Their number is least large in the two fields where they would be most conspicuous, for theologically the Southerner is a much more orthodox and less daring thinker than the Northerner, while a change of political opinions indicates a mental transfiguration almost to be reckoned among the miracles; but there is still a goodly number of scholarly men, young enough so that their memories are not deeply scarred by the firebrands of war, to whom travel and study have given an intellectual outlook, whence it is clear that our sectional feuds in Church and State do not overtop all else in human interest. It is they who are working for an educational ideal, where development shall replace showy accomplishment, for a real democracy among a people who, by a curious kink of destiny, are the most strongly intrenched in aristocratic notions of any who ever gloried in calling themselves Democrats, and for a welcome to good things generally irrespective of their having enjoyed the approval of their grandfathers.

Tho little alike in other respects. the scholar and the business man have this in common, that each in his own way has found an absorbing present interest which enables him to shake off that paralysis which is the curse of the South—the past. The man of business has probably no conscious philosophy of life which teaches him not to make a virtue of cherishing this disease of bitter memories,

but he has learned from actual contact that his Northern *confrère* is a very good fellow. Like the profesional man, he has traveled more or less; if less, he still is not without the touch of the outside world's influence, because it has come to him, now in the person of the capitalist or manufacturer seeking opportunities for investment, now in the shape of conventions and excursions of his fellows from North and West. To men thus drawn together by the paramount consideration of some material gain to be sought, conflicting opinions—especially inherited ones—temporarily become very immaterial things. In politics (for it is impossible to speak of the Southerner and leave out his politics) the man of business is naturally less tolerant than the professional man, for the obvious reason that having little time to think out the problems of government for himself, he takes his opinions ready-made from his newspaper. But because these opinions are not a vital part of him, he, too, save for some minor manifestations, might be talked to all day (about everything but the negro and the climate, which latter appears to be the "personally conducted" achievement of the Southern people themselves) without the revelation of any very marked qualities to differentiate him from the Northerner of like pursuits.

There are, however, the minor manifestations. For, after all, the right of these subdivisions to be grouped under one general head consists in the truth that the difference in the manifestations is only one of degree, and that, divide and subdivide as you may, you cannot make a group totally devoid of that something which sets apart the Southern man.

Possibly the essence of the thing is in what he thinks that he thinks about woman. It may be that he will never wholly divest himself of the idea that he possesses the one true brand of chivalry extant, and that no one will ever entirely persuade him that the kindness of letting her do what she will for herself can be compared with that of doing what he wills for her. As one man, whose evolution has reached an exceptionally advanced stage, put it when addressing the Female Suffrage Convention in New Orleans last spring: "While it is true that probably few of our men would vote for you, it is still no exaggeration to say that all of them would die for you."

It may be a peculiar mark of that Anglo-Saxon lineage about whose purity they are nowadays so strenuous that, as the ancient Germans feared captivity, so they fear toil "far more intensely for their women than for themselves." Many a poor clerk would rather support a collection of able-bodied women relatives in idleness than have the family name "disgraced" by letting them support themselves. And this same feminine contingent fosters the persistence of many of his antiquated superstitions concerning labor and the limitations in choice of professions imposed by the solemn circumstance of being the great grandson of Somebody. It was a Southern woman who said to me with inexpressible scorn: "I would as soon associate with my washerwoman as with my dentist."

A good deal might be said as to the actual value of Southern gallantry. Being somewhat "new" in my views, I individually probably underestimate a politeness which, tho it never would permit me to climb a hill unaided, veils a certain contempt for my weakness and inconsequence, both physically and mentally. Considering, too, the exalted estimate which each Southern man places upon his own chivalrous regard for my sex, it is somewhat remarkable how little confidence he has in the honor of all other men. Such, at least, is the inference to be drawn from his unalterable conviction that his wife and daughters are liable to certain insult if deprived for an hour of his protecting presence. In his public utterances he explains this as fear of the negro, but in reality he applies it to dozens of cases in which the negro could not possibly figure, and the Northern woman within his sphere of influence stands aghast at the catalog of places where she must not go without a man.

Of the Southerner's gallantry the supreme proof—in local estimation—is his street-car manners. It is quite true that it is only in the South that men offer me a seat in a crowded car, but it is equally true that nowhere else has a man, after doing so, told his neighbor audibly that "*his* wife isn't allowed to be on the streets at the time of day when the cars

are crowded." I have never decided whether I liked best his brand of politeness or that of the New England man who, having stood up beside me for a number of miles, when a seat near us was vacated crowded past me and sat in it till our car stopped in Boston. With these specimens of the courtesy of our two strongholds of American culture and gentle breeding I might be disposed to prefer the "go-as-you-please" habits of the unpretentious West, did I not recall the night when, on leaving a Denver theater, I was requested to arise from my seat beside a young woman because it was "reserved for her escort." (And he took it.) All of which leads me to suspect that, after all, our national street-car etiquet is not a subject upon which we can with safety indulge in sectional recrimination. And speaking of sectionalism, that of the reconstructed Southern man differs from that of his female relatives in lack of acidity rather than of potency. He has never gone quite so far from the boyhood of his kind as the man of the North, and as, even down to old age, he dances and flirts with a fervor which the Northerner loses in the thirties, so there is a sort of childlike *naïveté* in his unshaken confidence in the region which he proclaims (and one is tempted to wish that for variety's sake he could invent a new epithet) "his beautiful Southland." He points out to the visitor the beauties of its climate, its women and its hospitality, and when the guest politely acquiesces, he hurries off to his favorite newspaper the information that the distinguished Mr. So-and-so, after having visited extensively in Europe and America, declares that in all his travels he has never met such charming courtesy, etc., etc., like an ingenuous boy who believes that no masterpiece of French *chef* could equal his mother's doughnuts.

In his treatment of strangers his method of approach to a woman of reputed collegiate honors is worthy of mention. Unless her exterior be somewhat pleasing, be it added, he never does approach her—if he can find any one else to do it for him—but, supposing that she is comely, paying due heed to the fit of her gowns and tending to extravagance in hats, he brushes up his Latin, tries her on a Virgilian quotation ("*varium et mutabile,*" usually), and then, if she has received these tributes to her mental superiority in a becoming spirit, he expands into delightful reminiscences of his school-day scrapes and anecdotes of his favorite professor, "a graduate of the University of Virginia, and undoubtedly one of the finest Greek scholars in the entire South, ma'am." Such as she, he feels, are not to be approached with chatter of dances and ice-cream soda.

Another of his idiosyncrasies which has amused me is his profound and universal scorn for Chicago—especially its male population. For that of other Northern cities he displays some toleration. He admits that New York men know how to wear their clothes and order their wines at dinner, that Boston men (if there *are* any) are pre-eminently intellectual—but the Chicago man—heavens! a sordid beast, with a soul for naught but pork and filthy lucre. It is in vain that you remind him of Thomas concerts and a public library. Even the summer when he took his wife and daughters to spend a month at the Chicago Beach Hotel, he saw nothing but the Board of Trade and the Stock Yards. The reason, I suppose, why other Western cities are not included in this condemnation is that Chicago is all the West he knows. In his ignorance of the vastness of that portion of the North he almost rivals the Easterner, and he is as fully persuaded that the ladies of Omaha and Seattle can run back and forth to see each other of an afternoon as is any one ever born in Providence, R. I.

But, as I have said, the Southern man is in a process of development, and this development means, I believe, a gradual merging into the Northern type. Whether or not that is synonymous with approximation to the estate of the perfect man is probably open to question; but, then, how wearisome would be a perfect man! Only of this I feel assured, that she who undertakes to describe the Southerner a quarter century hence will find a different man; 'twere treason, doubtless, to predict that she can find a better one.

Social Heredity

BY H. W. CONN, PH.D.

PROFESSOR OF BIOLOGY AT WESLEYAN UNIVERSITY

SOCIAL heredity is a term which has come into use in recent years. It is employed in discussions of social evolution and its use is clearing up some of the confusion which has hitherto characterized such discussions, since it brings into clear light the sharp contrast between *organic* and *social* evolution. It may be of interest to students of social problems to know just what is meant by the term.

It is not bone, muscle and brain that makes a man, but the *society* in which he lives. Physically man differs little from animals; mentally he differs more; but socially the difference is world wide. Isolate him from his surroundings and he would be hardly more than an animal of superior intelligence. Only *in his environment* does he become man, and this environment is of his own creation. Civilization and not any structural or even mental attributes constitutes the chief character of man.

A question of some interest that has occupied the attention of biological students of social problems is how these characters, which are man's most valued possessions, are transmitted and accumulated. Is developing civilization the result of a growing intelligence, or is the growing intelligence the result of the civilization, or have the two developed without causal connection? As the result of the discussions following Weismann's theories it has become pretty well acknowledged that acquired characters cannot ordinarily be inherited and cannot, therefore, be counted on as playing any very considerable part in evolution. Tho not yet admitted that acquired characters can never be inherited, it is practically agreed that their influence upon organic evolution must be slight. Now the bulk of the attributes which characterize civilized man are of the nature of acquired characters. For example, man acquires his power of speaking, but does not inherit it. Nor can we suppose that any similar characters are inherited, and we know that they are not transmitted like bone and muscle. Nevertheless, they are transmitted from generation to generation with unerring certainty and just these characters constitute the chief attributes of civilized man. They accumulate generation after generation, becoming more and more highly developed, and, as affecting evolution, they appear to have relations similar to those of innate characters—*i.e.*, those which are actually inherited. The transmission of such characters from age to age has recently been called *social heredity*. While this term is a convenient one and may be properly used, it must be carefully distinguished from organic heredity, for the two have nothing in common.

Social heredity may be not improperly defined as the creation of an environment. All other animals live in a natural environment; man alone in an artificial one. Animals wander over the earth or swim through its waters at the mercy of its forces. They freeze in winter, are overcome by heat in summer and destroyed by the storms. They appropriate for food only such fitting material as chances to lie in their way. A change in conditions, a little more or less rain, the drying up of a brook, the removal of a river bed, or the presence of too many enemies means the destruction of millions, for power to adapt themselves to new conditions they have not. A very few only have acquired even the simple habit of building a crude home for the rearing of their young. Among some of the higher insects an instinct for building a home has been highly developed and become the chief characteristic of the animals.

But such instances are rare, and where they do occur they do not resemble in the slightest degree the social conditions of man, either in nature or in mode of transmission. Indeed such examples only serve to bring into sharp contrast organic and social heredity. The insect builds its social communities because it

inherits an instinct demanding such social life, and each species inherits a different instinct and develops a different type of community. A bumble bee is hatched from an egg in the spring that has been lying all winter. The newly hatched insect has never seen its parents and knows absolutely nothing about the social customs of the race. It has no environment that trains it in the direction of social life. But it produces offspring which in a few weeks, with unerring certainty, form a community with identical customs of those of the year before. Tho never having seen a colony of its species, the community that develops in the coming summer is identical with that of the preceding summer. The community has not been produced by the environment, but by the internal nature of the insect. The bee has inherited, by *organic* inheritance, a nervous system the structure of which makes the individual act in certain ways which result in the organization of the social community. The social life in this case is the result of internal structure and not of the environment.

How different is the case with man. Man inherits no trace of civilization. If left to himself he might perhaps become a social animal under the influence of inherited social instincts, but he would not become a civilized being. Imagine, if we can, a child growing up like the bumble bee, without contact with other men, out of relation to a civilized environment, as a wild man in the woods. Just what he would be we do not and cannot know. Doubtless he would be an intelligent animal and perhaps recognizable as the species man, but he would not be man as he actually exists. Man does not inherit in his nature a nervous system forcing him to develop customs quite independent of the environment in which he lives. Civilization is not a part of his nature as communal life is a part of the nature of the bee, and he therefore does not acquire his distinctive human attributes by inheritance.

Nevertheless mankind does acquire his special attributes with a certainty no less than that with which the bee acquires his habits of colonial life. The man without the attributes characterizing civilized society is as rare as the insect without the colonial instinct. But in the one case it is the result of organic and in the other of social heredity.

Organic heredity is an unsolved mystery, but social heredity is easily understood. The child is born with no trace of language and with no innate power in him that would of itself develop into language. If left to himself he would develop none. If accidentally associated with others like himself he might develop some means of communication, but he would certainly not develop the language of his parents. But the conditions in which the child is actually placed, and which his parents have made for him, are such that he develops the power of speech and of speaking the language of those around him with a certainty as great as that with which he develops his truly inherited characters of blue eyes and black hair. To be sure, the blue eyes and black hair are part of his organism and positively inherited, while language is simply acquired by imitation. But the one is as certain as the other.

The child is born with certain innate moral tendencies. Over the much disputed question whether the moral nature is innate or acquired we need not disturb ourselves here. Doubtless man is born with certain innate tendencies, among which may well be included the moral sense. But it is certain that the method of expression of that moral sense is a matter of environment rather than heredity, one of social rather than organic heredity. If he is brought up in our own communities he develops the idea that murder is a great wrong, while if brought up among savages he develops the idea that murder may sometimes be highly justifiable. If trained among the Hindus the idea of breaking his caste is more abhorrent to him than that of committing a murder, and he regards it as more sinful to kill a serpent than to kill a man. The innate idea of right and wrong may be the same in all men, or it may be more highly developed in some races than in others; but the peculiar actions toward which these innate ideas are directed are dependent upon conditions and environment rather than inheritance. The moral *sense* may be a matter of organic inheritance, but moral *codes* are transmitted by social heredity alone.

Nevertheless it is just as certain that the Hindu will develop his own peculiar moral nature and follow the Hindu moral code, while the European will develop a moral nature entirely his own, as it is that the one will be dark skinned and the other light. Ethical customs are incidents controlled by social heredity and vary with the environment; but, given the environment, they are just as sure as are characters transmitted by organic inheritance.

The child is born with certain innate mental powers. These powers are not, of course, developed at birth; but his nature is such that as he matures he acquires the power of mental action. These powers develop as he grows and become wonderfully different according to the condition in which he passes his youth—*i.e.*, his education. There are doubtless differences in the innate mental powers of different individuals, but these do not account for the difference between the inhabitant of the slums and Fifth Avenue. There is no reason for thinking that the mental powers of the Chinaman are very different from those of the Englishman, but what a contrast between the two when they have reached adult life. Not only is the fund of knowledge which each has acquired different, but even their methods of thinking have become unlike. The mental powers of the adult are more dependent upon the kind of civilization under which he is reared than upon his innate capabilities. Whether the man of the civilized race has a mind much superior in innate power to that of the bright savage, whether the man of the twentieth century has mental attributes superior to those of the Greek, are questions that have only recently been raised, but are by many answered to-day in the negative. Be this as it may, all admit that the chief difference between these three is not in innate mental attributes but in the environment in which they are placed. The Indian chief may have by inheritance mental powers equal to those of the white man, but the latter has at his command the accumulation of the experiences of centuries and the combined force of united millions of people, while the Indian has only his own native ability, aided by a few crude traditions. Organic heredity has made them not so very different from each other, but social heredity has placed the one immeasurably ahead of the other. Each was placed as a child in an environment, and this environment has had more to do with determining the characters of the adult than have the innate powers with which he was endowed at birth.

Social heredity is thus the result of the action of the artificial environment with which man has surrounded himself. It affects acquired characters only, having nothing to do with innate or congenital characters. But in spite of this it has become a factor that supersedes organic heredity, as least so far as concerns human evolution of recent centuries. Its action is very different from that of heredity as commonly understood. The evolution of animals (organic evolution) has occurred only as structural characters have become so far incorporated in the organism as to be transmitted by organic heredity. This process is slow and is only slightly affected, if at all, by acquired characters, and only affected by the environment through the action of natural selection. The social evolution of mankind is brought about chiefly through characters that are acquired by the individual which never become part of the organism and are not transmitted by heredity. The former process takes many generations to accomplish any considerable change in evolution; the latter may produce a revolution in a single generation. Organic heredity is the result of internal factors; social heredity is the result of external factors and is almost wholly independent of organic structure. What a man possesses as the result of his organic inheritance he has quite independently of his environment and will possess even tho utterly isolated from other individuals. What he possesses by social heredity is dependent upon his relations to others and will never develop out of contact with men. That which we possess by social heredity is like the property that the father leaves his son, never being a part of himself but simply left in his possession to use, to increase and to hand on again to the next generation. But tho never part of his nature, it is just as truly a part of his possessions as any organic or structural character.

Indeed, characters transmitted by social heredity are even more certain than those due to organic heredity. Heredity is always an uncertain matter. A father may have black eyes, but it is quite uncertain whether his child will also have the same, and we are never certain about any particular hereditary trait. But not so with matters relating to social heredity. It is absolutely certain that the child, if a normal individual, will acquire the language spoken in his family. So in other respects social heredity, tho dealing with characters that never become part of our nature, is more sure in its action than organic heredity.

All this may seem only an old story under a new name. But whether an old story or not, its significance has only recently been appreciated. Writers have been trying to explain the history of the so-called social organism and in doing so have tried to apply to human evolution the same laws they have discerned in the study of organic evolution of animals. In some of the most suggestive discussions of this subject confusion and error have arisen as the result of such an attempt. Some have tried to compare the rivalries of social life with the struggle for existence. Some have found ethical instincts leading to degeneration because they reverse the action of natural selection. All this confusion arises from comparison of two types of evolution which should not be compared, and much of it will disappear as the real significance of social heredity is appreciated. A proper understanding of human history can be reached only as these two methods of inheritance are clearly distinguished. The social organism is not an organic structure at all, but only an immense accumulation of acquired characters handed on by tradition and record. Organic inheritance controls the development of the structure of animals and plants, including all the innate characters of man. Social heredity controls the evolution of the so-called social organism. The former is wholly beyond the influence of the human intellect; the latter is under the direct control of intelligence. As science is rapidly becoming convinced that human evolution is chiefly social evolution, it is realizing that social and not organic evolution lies at its foundation. It recognizes that an individual man, even tho failing to rear children for posterity, may be a primary force in the guidance of future generations, a condition totally impossible for any other animals. Other animals influence the course of evolution only through the offspring they produce; man even more through the life he lives.

MIDDLETOWN, CONN.

Decadent Art

BY EDITH M. THOMAS

THEY said to us, "Look, how the serpent's scale
The tints of the rainbow reflects!
How the honey-bee in the Colchian flower
No poison distillment detects!
Thus, even from basest and vilest, our Art
Her temple to Beauty erects."

We answer: "Let be that your Art can upbuild
From basest and vilest her fane;
Go, taste, if ye will, of the Colchian sweets,
Tho madness soon kindle your brain,
And gaze on the tints that the serpent reflects,
Tho ye reap but remediless bane!

"Yet know, that your choice is of weakness, not will,
Because ye are old ere your hour;
To the honey of Hybla your palate grows dull,
So, ye crave for the Colchian flower;
And the sheen of the serpent ye praise, who are blind
To the arc of the sun-lighted shower!"

WEST NEW BRIGHTON, N. Y.

Memories of an Early Boyhood

BY STEPHEN M. DALE

[The following is a continuation of the article we printed in our issue of May 7th under the same title, only that now the hero has passed from childhood into boyhood.—EDITOR.]

FROM a certain well defined point on I begin to remember Dick no longer as a Child, but as a Boy; for the period of boyhood is one distinct and separate from two others, the whole of those years up to Manhood being divided, like all (other) Gaul, into three parts. First, there is the stage of Childhood up to, say, the twelfth year, the stage the first installment of this paper dealt with. Secondly, there is the stage of real Boyhood, up to the sixteenth or eighteenth year, when he leaves home for work or college. Thirdly, there is that period wherein he is a Youth, a period in turn bounded on its last extremity by his twenty-first year, in which he reaches Manhood.

During his half dozen years of Boyhood, then, this boy was—well, was just a boy. Unlike himself in former years he was no longer lonely; for, in all this period, I can recall no single thing worth noting that he did alone. He always wrought conjointly with two others, and that trio were inseparable. Each had a personality of his own and together they embodied in themselves such traits of leadership as made them, by sheer right of preference, the true Triumvirate of

THE GANG.

The other two were "Skip" and "Bud." "Skip" was a wiry, wily little chap, excitable and nervous and yet suave and slick and politic. He had developed, to its highest point of efficiency, that rare ability of getting himself out of trouble and of getting other people in. He could perpetrate more mischief and yet keep a straighter face; could cause more trouble and yet look more saintly; could impose more torment and yet look more like a martyr, while he did it, than any other living mortal, old or young, whom I have ever known. When he grew up he studied law, later he entered politics, and has since married an heiress and is living in a villa in the South of France.

"Bud," on the contrary, was solemn and phlegmatic, slow and ponderous, the very opposite of "Skip" in everything. He was stolid and persistent, and thus, partly by nature and partly by practice, stubborn. When all the other members of the gang had scattered, each to his life's avocation, "Bud" stayed on at home, grew great and massive in blue jeans and overalls, married the sweet-faced, doll-featured "schoolmarm" of the village and has grown rich running livery and feed stables.

"Dick" was . . . But modesty—and other things—forbid. He was of use chiefly in pursuits at school, where his especial service was in doing written recitations in two other hands besides his own. He also had artistic skill to that extent that he could draw pictures—so long as things stood still and faced westward—and thus was of inestimable value illustrating show bills and drawing cartoons. The other members of The Gang, four of them, were mere henchmen, hewers of wood and drawers of water, good only to fetch and carry and to serve under direction, not to say dictation.

DOINGS IN THE DEN.

Strange is the sense of independence noticeable in boys even at this early age. The Gang, as every other group ever foregathered has had, had a rendezvous. It was a shanty, built along the river by the "Old Swimmin' Hole." Here, many, many times, they did as many things forbidden in the Rubrics, and here learned as well to do as many more. Would that the veil of Charity might be drawn over all those things! And so I think it may; for when such things occur methinks that the Recording Angel himself must grow reminiscent and turn his attention somewhere else.

Oh, what fun with that old deck of "Authors!" Much those seven youngsters cared for Longfellow and Whittier and Browning—until they learned how to use them as right and left bower and ace. Then all was different. Letters took on a new meaning; even poets had not lived in vain. There, too, they

learned; with corn silk and with mullein leaves; they learned to do what Sir Walter Raleigh learned after Drake's first return voyage. There also razors were stropped, surreptitiously, having been "hooked" by each boy in his turn from home, until it came "Dick's" turn, and thereby hangs a tale.

The razor was a good one; that was not the trouble. It was almost new, in fact, and served its purpose well. The real trouble was that, with the absent-mindedness which always has been his sole sign of genius, "Dick" forgot to take it home and put it in its place again. That evening its owner came to use it and, finding it absent, set about to search for it; the boy arriving home from play just while the search was on. He was afraid to tell; he was afraid not to; but in the end the first fear proved the greater. He could go and get it next day and would put it in a corner of the drawer, where it might have been overlooked. This plan he formed while he stood looking on, the father not seeing the boy the meanwhile. And if he had? No; "Dick" was never thrashed at home. His father was a quiet man, one of that sort with masterful manner and strange, clear, shrewd, black eyes. He had a way of looking through one as though he could read things written on the back of one's mind, where he thought he kept them out of sight. Oftentimes in after years, when "Dick" has realized how flimsy were his shams and how they had been seen through, those sad seasons of chagrin have been for him due punishment. All of a sudden, turning in his search, his eyes fell on the boy, and "Dick" could form no theory why as suddenly he stopped his search, broke into hearty laughter and set off toward the barber's. Nor did he know until the next morning, when he chanced to look into the mirror, that across his own small lip there was an awkward cut by far more noticeable than had been the down which it replaced.

AN EVENT AT THE CIRCUS.

To a boy each season of the year is defined by its appropriate pursuits and duties. The rotation of his games goes on with the precision of the equinoxes. Nor does he ever do anything out of season. He would no more play marbles in August, or fly kites in September than would sap reverse its periods for running up and down the tree. Kites, tops and marbles are for spring; swimming and boating—all that goes with water—for the summer: hunting, nutting, woods and fields for autumn, and all that is left for winter. And yet, with it all, one thing comes unannounced and equally unseasonable any time—that is, a wet day. So, for a wet day, there should be some standard pastime. And there is. It is the circus. With a barn for tent; with pins for money; with dogs for elephants; with cows, white rabbits, rats and guinea pigs for a menagerie, and boys themselves for actors, what is there left lacking? It was in another way that trouble came.

The way was this. At this circus held the week before in town a lady was shot from a cannon. This was a new idea and must be adopted at the next performance. Of course, in the barn, it was out of the question to use an explosive. It was also out of the question, without some such propelling power, to fire a body horizontally. But they would find, for both these, substitutes. A large mouthed cannon was constructed; that was easy—with a barrel. A scheme for firing was devised; that also was easy—with "Bud." Let some boy be loaded in the barrel, which lay roped across a girder of the haymow, and then let a spring-board be applied to boy and barrel at once. The impact would propel him, not horizontally to be sure, but downward, curving grandly through the air and lighting gracefully and gently on a pile of hay below. It only remained to find the boy. This threatened to prove difficult until "Skip" pointed out the honor to accrue to the one chosen and thus set four innocents wild in their rivalry each to be "It." At last the biggest and most innocent, a great, green, gawky chap was chosen (?), dressed in skirts and loaded up, heels foremost, in the barrel. The board was drawn back, loosed and . . . Bang! Out came the human missile.

All would have gone well had not his feet, as always larger than his head, got themselves tangled in the mechanism. As it was, down, down he dropped with one great thud, on what had always served him for a head, thump, on the bare barn

floor. It was a badly scared half dozen boys who gathered round the muddled, limp, unsightly and unconscious form to disentangle it from barrel and board and skirts. It took a full half hour to roll him, turn him, douse him with cold water, coax him back to consciousness and carry him, worse scared than hurt, off home. It also took "Skip's" best palaver for a week to placate his fond mother and persuade her that her darling's fall was the price of his supreme popularity.

AN OLD FASHIONED SNIPE HUNT.

Every one who notices at all has noticed the sudden reversals of temperament by which a boy at one time is frank, at another diffident, at one time boisterous and suddenly thereafter silent; has noticed, too, the variableness of those states of extreme goodness and badness by which he is one day angelic and another soon to succeed it diabolical. Some one or all of these things may explain the feelings of The Gang toward one who was thrown suddenly into their midst, a boy out from the city to spend in the town a summer's holiday. He was the exponent of a well-known type—that terrible monstrosity, a juvenile prig. He was learned in the ways of life, and nothing any more had power to interest him. The satiety that he had reached was best described by "Skip" after the night when in ribald excitement the boys all attended the annual "Entertainment" of the Reading Circle in the old town hall. "Skip," moralizing on it afterward, marveled, "Why he didn't nearly bu'st at all before the curtain went up." Such was "Skip's" comment; while in addition "Bud" had his own grievance; it was that, being from the city, he wore long pants and talked of "trouserings." "Dick," too, had a grievance; this foreign prodigy had taken drawing lessons, and could picture beasts that faced in either way with equal ease. The three discussed him thoroughly, lamented his *blasé* condition and decided they would furnish some excitement for him, even tho it took some trouble. Was he not a stranger and their guest?

How they chose to do it was by reviving an old form of sport, so old that he had never heard of it, and, therefore, new to him. Would he like to go snipe hunting? Snipe could be caught only at night, and that by holding nets in certain runways, the best of which was one in Farmer Jones's swamp land. Farmer Jones was well known to be one little in sympathy with boys and to have little mercy on persons caught trespassing. Besides, snipe were a good price that year; most probably he wanted all of his himself. Was Master City Boy afraid? Not he. So on and on, with just enough descriptive narrative and just enough of banter, they got him so interested that he begged to go—begged to be taken.

The hunt began with a three-mile walk from the town out to this swamp; it proceeded with circuitous wanderings through woods and underbrush until the boy, bewildered as he was already by the darkness of the night, had not the faintest notion where he was. There, as a special honor, he was left to hold the net while all the others went to drive the snipe. . . . Some time, long, late, hours later, there came trudging back to town a boy escorted by one Farmer Brown, at whose house, scared and scratched and muddy, he had hallooed for admission at the dead of night. After tramping and then tearing, terrified and lost, through acres of mud, brush and briars, he had brought up at that house. It was a hard but well-conned lesson he had learned. The next day The Gang took him to its heart and from that day forth he was one of them; for, tho he rusticated with his "country cousins" for three months, he never boasted either of his courage or his clothes again.

ALL HALLOWE'EN.

But this narrative can proceed no further without introducing Tim Flannigan. Tim was withal the most lighthearted, most improvident creature I have ever known. By special appointment he became the boys' *bête noir;* for every one knows that boys must have some such one, just one generation older than themselves, to tease. Tim acted well the part. He spent one-half his time in teasing them, the other half escaping or pretending to escape their plots laid for him. He was not an ideal farmer, nor, indeed, an ideal anything else, for he cultivated a studied indifference to the state of his fences and his garden patches. Yet who could say, that saw

how dogs ran after him and children tumbled at his heels, that he had not, after all, chosen that better part?

And, too, I had almost forgotten; in fact, to begin with, he was Irish. This meant that he had ready tongue, quick wit and large imagination, which together made him able to tell stories whether frivolous or grewsome. It was in the latter that he excelled chiefly. He could interpret dreams, could explain omens, and could translate signs. Also, as climax to the whole, he thoroughly believed in ghosts. It was at this stage, then, chiefly because of his tutoring, that the boys began to pay attention to their dreams. It was Tim, in turn, who could interpret these and match them with some former incident, fulfillment or coincidence.

The last night of October came that year, and with it would come trouble—so all older folk predicted; for all the boys by this time were old enough to be out late at night. They ran as wild as cats, and many a goodly dame they awakened from her slumber by the hurried patter of their feet on flag stone pavements and as many a maiden from her "beauty sleep" with cries of "Bob-o-rea." But that especial night it was on Tim that they would specialize. They knew his weakness; they would visit his lone cottage where he slept alone, and . . .

But they reckoned without Tim. Tim had a dog, a harmless dog enough—an ordinary, yellow, yelping, bounding, playful, pup dog, who would follow any one, jump over them and on them and about them, and who reckoned as especial friends those who would run from him and thereby give him a chance to give chase. Tim also knew the ways of phosphorous; the boys did not. He made a canvas cover to just fit the dog, then made a mixture with which, when the time came, he would smear that cover, went home early, ostentatiously, that evening and went to bed (?). Two hours later came the boys. They had dressed in the old covered wooden bridge below the house, and now a half dozen of as ghostly ghosts as ever trod a graveyard stood in shadow to wait his appearance in answer to loud cries of distress raised on his doorstep. Suddenly, in answer to their summons, there appeared, not Tim, but in his stead, a great, gaunt, bounding beast of fire, and . . . well, in less time than it takes to tell it, seven frightened boys were half a mile away, the only things that marked their path being the tattered remnants of as many sheets strewn all along the road.

AULD LANG SYNE.

Since those days twenty years have passed; and any of those boys would give . . . But what's the use? For who can live youth over? "Old inhabitants," who once looked down their noses or across their spectacles predicting final destinations for them all on certain platforms of a regulation type with ropes dangling above them, are those who now grow most proudly reminiscent and quote to each other tales of the pranks played in those past years. In houses where the mere pronouncing of those names once caused an apprehensive sigh, fond parents sit up late at night to tell these very tales.

And others share their joy. Good, frugal housewives, whose pantries were raided; erstwhile dairymaids, whose cream they stole; plain townspeople who missed ripe grapes and peaches by the bushel, and farmers who tried to raise melons for market, but in vain, now, when these visit them, press all their scanty store upon them and count it their chiefest honor and their greatest happiness to watch them eat. Devoted teachers, whose efforts they spurned, and friendly sages, whose advice they scorned—dear, lonely souls in whom the love of God dwells bountifully—fairly weep in foolish pride to think of them and tell to any who will listen their part in rearing of Blank, L.L.D., of Judge Dash or the President of the Gold Trust.

Six months ago it happened that six middle-aged men met at one time, for the first time in those twenty years, at home. As a consequence, the town today has a new bridge, whose buttress towers above The Den; the mortgage that for thirty years lay on the Jones's Farm is raised; somebody has bought Tim Flannigan an annuity for life, and over Jimmy Crawford's grave there stands the finest tombstone in the little cemetery. Such, such is life. And who would have it otherwise? For "what a wilderness were this old world if man were alwavs man and never child."

Literature

The Munching Habit

It was a salutary lesson in the deceitfulness of appearances which the reviewer received through the medium of a bunch of books by Horace Fletcher.* From their typography, literary style and zealous partisanship, he "sized them up" at a glance as belonging to the literature of clamorous causes, devoted to the booming of some such reform as acquires the name of "fad" and for its promoter the appellation of "fiend;" a class of literature which the educated literary palate rejects as instinctively as the palate of Mr. Fletcher refuses the indigestible morsel. Now, the reviewer is not ready to say he was wrong in his first impression—that is asking too much of any man—but he must say that the "fad" is a good one and that Mr. Fletcher is a beneficient *daemon*. He even will go so far as to admit—altho all that can be reasonably required of a reviewer is that he read the books submitted to him, and he is not expected to take any of their lessons to himself—that he, since reading these volumes, is chewing as he never chewed before.

The popularity and influence of these books seem the more remarkable when we consider how old are the truths they teach. That worry and anger and fear are unnecessary and harmful to the individual and society and ought to be eliminated; that they are not only injurious mentally and morally, but also that they have a bad effect on the digestion; that men ought to eat less and more slowly, and chew their food finer; all these are things which have been taught by saints, sages and scientists for several thousand years.

But Mr. Fletcher is not a mere talker; he makes himself conspicuous by following his own advice. He claims to have so far emancipated himself from these evil passions—the thing sounds incredible, but so it is printed in the book—as to feel no annoyance or irritation from book agents, cabmen and Pullman porters. What is capable of more objective demonstration is the fact that he has succeeded in cutting down the food necessary to keep himself in good condition to about a third of the ordinary ration, and feeds himself well on an expenditure per day of some nine cents in money and twenty minutes in time.

This he accomplishes by a method of prolonged mastication, which is so little in vogue as to be practically a new discovery and an acquired art. A person who wishes to adopt the new *régime* must first break himself of the habit of swallowing. He may eat what he wants, and when he wants and all he wants, provided he chews each mouthful until it is so completely insalivated that it slips imperceptibly down the throat, and any particles which cannot be brought into this condition are to be removed from the mouth. Taken under these conditions, a very small amount of food satisfies the appetite and apparently also the needs of the body, while the waste products are reduced to about a tenth of the usual quantity and become comparatively odorless and inoffensive, thus reducing the intestinal fermentation which is a source of so many diseases.

Mr. Fletcher, like writers of similar temper, shows some contempt for science, which is unfortunate, for his argument would be greatly strengthened by greater use of what is known of the mechanism and chemistry of digestion. The mouth is not a funnel for the convenient reception of food, as it is commonly considered, but one of the organs of digestion, where, through the action of the saliva, starch is converted into glucose and common sugar into similar products. If the amount of salvia added to the food is insufficient, or if the time of its action is too short, the process of digestion of this class of foods is checked when it passes into the stomach, and is never afterward so easily effected.

The dietary standards of Voit and At-

* The New Menticulture; or, The A, B, C of True Living. The New Glutton or Epicure. The A.-B.-Z. of Our Own Nutrition. Happiness as Found in Forethought Minus Fearthought. New York: Frederick G. Stokes Co. Each $1.00 net.

water are not so contradictory to the author's theories as he fears. They are simply based on the averages of well-fed people, with the ordinary way of eating. The reviewer has calculated the dietaries of several individuals, who maintained good health on an amount of food, especially protein, much below that supposed to be necessary for equilibrium.

Professor Chittenden, of Yale, is now carrying on a series of experiments to determine the minimum diet for efficiency, which will certainly give very valuable and much needed information on this point. The soldiers, who are the subjects of this experiment, called by the newspapers "the starvation squad," are doing more useful service than any other men in the army; for our greatest enemy, slaying more each year than are lost in war, is dyspepsia, and if they help us to conquer this disease they will better deserve a monument than their comrades who are practicing to destroy life instead of saving it.

In the meantime let Mr. Fletcher and his enthusiastic friends continue their propaganda by all their powers of speech and pen. If better food habits cannot be inculcated except by making a religion of it, so be it. There have been many religions started with less worthy objects. Professor James classes "Meticulture" among his "religions of healthy-mindedness" and healthy-bodyliness is a necessary adjunct.

Parliamentary England

THE latest addition to the "Story of the Nations" series, which already included volumes on "The British Empire" and "The People of England," is an account of *Parliamentary England,** by Mr. Edward Jenks, Reader in English Law at Oxford and editor of the recently established *Independent Review*. While it covers in outline the entire history of British politics from the Restoration of 1660 to the Parliamentary reform of 1832, its main business is to trace the evolution of the cabinet system, a system whose history and character are full of interesting problems to the student of the art of government.

The blending of scholarship and popular style which is a tradition of this series is not departed from in the present volume. There is no trace here of that immoderate stress upon technicalities which we so often find when the occupant of a chair of law takes to writing history. Professor Jenks, indeed, is a master of clear and even brilliant exposition. Take, for example, his picturesque character sketches of William III, Walpole, Chatham and Pitt, and this incidental comment on the reform agitation of 1831:

> "The old sophistical plea that the rotten boroughs had brought to light such shining stars as the elder Pitt and Burke, Charles James Fox and George Canning, was repeated with wearisome iteration; but the crude fact was, that this phosphorescence of decay had long ceased to shine."

An epigrammatic touch, again, may be found where Professor Jenks, explaining why for a long period the House of Lords was not unpopular, says of social dignities that "sensible men have a quiet contempt for such things, ambitious men hope to win them, ignorant and vulgar people admire them."

Obiter dicta of this kind are not, perhaps, strictly within the province of an historical record, but to the reader they are very refreshing; not the least when they are so pertinent to present conditions as Professor Jenks's cool remark that the Lord Chancellorship is always given for political services, and that "the assumption, by the occupant of the woolsack, of a superior privilege resting on vast legal attainments, is, in the majority of cases, quite unwarranted by the facts."

The particular feature which distinguishes this book from other investigations of the same subject is the author's rejection of the general opinion that the cabinet system was adopted in the crisis of 1693. It is true, of course, that certain features of it existed then and had indeed shown themselves as early as the reign of Charles II. The point is, however, to distinguish between those elements that are merely important and those that are essential. If this caution is observed, Professor Jenks holds that the real time of origin will be found to be later. "At the accession of Anne, the

* PARLIAMENTARY ENGLAND: THE EVOLUTION OF THE CABINET SYSTEM. *By Edward Jenks.* New York: G. P. Putnam's Sons. $1.35.

cabinet system was a dimly formed project; at the death of George I, only twenty-five years later, it was an accomplished fact." If one is not content with anything short of an exact date, 1705 is suggested as the year which has the greatest claim. The arguments by which this judgment is reached are too extensive to be presented here, even in summary, but they are cogent and easily intelligible. The account of the part played by Walpole in the development of the new system particularly deserves attention.

The final chapter, entitled "History and Criticism," outweighs in importance all the rest of the book, valuable as that is. It will probably be appreciated more highly in this country than in England itself, for it helps greatly to clarify those vague ideas of the function of the Cabinet which are natural in observers accustomed to a more exactly defined constitution. The excellence of the book in this respect is no doubt largely due to the fact that the author spent some years as Professor of Law in Sydney University, New South Wales, and thus had an opportunity of learning how the machinery of Westminster appears at a distance. His own Australian experience has thus helped him to write what American, as well as colonial, students will recognize as perhaps the most illuminating description that has ever appeared of that element in the British political system which is most perplexing to an outsider.

Admiral Porter *

The main objection to this book is its constant belittling by implication of the deeds of Farragut, and its needless superexaltation of the deeds of Porter. There was no real rivalry between these men while living—there is no need of injecting a supposititious one into history. Porter's achievements were peculiarly his own, and abundantly meritorious to secure for him ample renown. Nor has he ever lacked advocates to see to it that he got full measure. His uniform and sword are in the National Museum; the relics of the victor of Mobile still remain in the keeping of his son.

Porter entered the Navy as a midshipman in 1829, and when the Civil War broke out thirty-two years later, was still a lieutenant. The seniority system was the ball-and-chain tied to his leg—and he was a shining example of its braking effect since he had all possible "pull," family, political and otherwise, which got him repeated cruises on the Mediterranean station, then the most desirable of all. But no command came to him, save of the old "Supply," when she made two opera-bouffe voyages to Smyrna to get camels, which the ever fanciful army people imagined would be peculiarly suitable to haul artillery over the "Great American Desert." Some of their descendants are roaming around there yet. For a while he got furlough and commanded merchant steamers on the Pacific, and when the war came was seriously thinking about resigning, since the best that could be done for him apparently was the charge of a miserable little surveying expedition on the west coast.

The war gave him his chance. His mortar schooners on the Mississippi did excellent work — despite Farragut's doubts about them—and then it seemed that his career had ended, for some incautious criticisms made in Newport brought down on him not only the wrath of the powers that were but shelving orders to equipment duty with the Mississippi flotilla. A fortunate conversation with President Lincoln changed all that—and in lieu of effacement, Porter jumped over all the captains and commodores and found himself rear-admiral, and not the purveyor for, but the commander of, the Mississippi force. What he accomplished at Arkansas Post, Vicksburg and Red River under difficulties literally appalling is now every day history, and the better it is understood—and it is told nowhere better than in Mr. Soley's volume—the brighter Porter's fame glows.

After the war he changed the Naval Academy from a high school, ruled by a few civilian professors, to a naval college managed by officers of the Navy. He abolished the old system of espionage and put the midshipmen on their honor to observe regulations. He was made Vice-Admiral, and on the death of Farragut succeeded him as Admiral

* Admiral Porter. *By James R. Soley.* D. Appleton & Co. New York: Price, $1.50.

of the Navy. He was the *de facto* Secretary of the Navy during Mr. Bories's reign, and with much glee "shook things up," but afterward he ceased to be a factor of moment. He wrote voluminous yearly reports on everything naval, wandered for diversion into the flowery paths of literature, and after a life of seventy-eight years, during which he had always given his best to his countrymen and left them for all time his thankful debtors, and after, besides, beeing the new Navy well and safely launched, he peacefully passed away.

Of that new Navy—meaning now not ships, but men—Porter was the true harbinger. His life was one long protest against the levelling effect of the seniority system and the doctrine that rank alone counts, regardless of the attainments of individuals. In season and out of it he kicked at the lofty omniscience of numbskulls, who had merely lived into their places. He firmly believed in putting merit where it could do the most good. If the individual had the formal rank, well; if not, that fact did not trouble Porter any more than the color of the man's hair. His subordinates were always his admirers, and he never failed to commend them when he thought they had earned praise. The Navy of to-day is shaping itself automatically along Porter's lines. Seniority prevails as hitherto—but custom is modifying it. Ensigns and Lieutenants, if qualified, are listened to with respect by Admirals and Captains at the War College lectures—and if a battleship mess boy can shoot straighter than any one else, his is the coveted post and pay of turrent captain and—next to the division officer—his the command of the two great 12 or 13 inch guns. "Previous rank," recently said the Secretary of War, commenting on the Wood controversy, "is of little consequence, provided the service shall have been long enough to furnish the requisite experience and make the demonstration of capacity certain." That is Porter's doctrine, pure and simple.

The Reminiscences of an Astronomer. By Simon Newcomb. New York: Houghton, Mifflin & Co., $2.50 net.

Professor Newcomb tells the story of his life simply and modestly. He was ushered into "the world of cold and darkness," as he terms the world of his nonage, near the little village of Wallace, in Nova Scotia, and he lived in the British provinces until, in his nineteenth year, he ran away from a quack physician to whom he had been apprenticed, and came to the United States. From teaching school in Maryland he made his way to the Capital, and succeeded in getting an assignment to the office of the Nautical Almanac, in Cambridge, Mass., as an astronomical computer. His birth into "the world of sweetness and light" he dates on the morning in 1857, when he entered on his duties in this office. His long life has been a busy and a fruitful one, and it is doubtful if any man has contributed so much to the present eminence of American astronomy as has he. His work in determining and comparing the motions of the asteroids (1858-60) effectually dismissed the theory that these minute bodies are the fragments of an exploded planet. His next special work, prosecuted after his removal to Washington (1861), was that of studying the movements of the moon. His study led him to the Paris observatory, where he discovered manuscript records of star occultations dating as far back as 1675. The result of his work proved that the Hansen tables, which were everywhere in use, were inaccurate, altho, as he confesses, "the cause of the [moon's] deviation is not entirely unfolded even now." With his assumption of the headship of the Nautical Almanac office in Washington, in 1877, began his great task of computing the value of the positions of the sun, moon, planets and fixed stars, since 1750, and compiling the formulæ for the perturbation of the various planets by each other. The book is by no means a mere record of Professor Newcomb's labors. It is crowded with incidents, observations of men and things, and tributes to fellow-workers. Especially interesting are the accounts of his European travels, and his chapters on "Scientific Washington" and "The Old and New Washington." Sumner he knew well, and also Garfield, and the tribute which he pays to the latter is eulogistic beyond his wont. Civilian tho the author was, he did not escape military service. General Early's raid, in July, 1864, caused the hurried calling to arms

of nearly every able-bodied man in the city, and among these was Professor Newcomb. But after a two-days' fight the danger was past, and the volunteer army was dissolved. Another exceptionally interesting chapter is that on "Great Telescopes and Their Work," which pays deserved tribute to the excellence of the great disks prepared by Alvan Clark.

Pioneer Days in Kansas. By Richard Cordley, D.D. Boston: The Pilgrim Press.

This is a volume of sketches of the days before and during the Civil War in Kansas. They are vigorous, lifelike, and give the younger generation a notion of what was the stress of living and fighting in the stern days when Kansas was the center of the political conflict over slavery. Dr. Cordley came to Kansas in 1857, and does not tell the story of Ossawattomie Brown, but the Quantrell raid, which nearly wiped out Lawrence, where Dr. Cordley was pastor, with its wanton murder of nearly two hundred men, is the subject of one of the most vivid chapters. As Dr. Cordley was one of the Andover Band who established early churches in that disturbed territory, the volume is largely concerned with the church side of the settlement of the State, which was a very large side of its history, for it was the churches of the East that sent the flood of immigration which saved Kansas to freedom. One chapter tells the story of "Lizzie, and the Underground Railroad," and the present reviewer can vouch for its correctness, for he was in Dr. Cordley's house that night and watched till Lizzie was spirited away from her watchful pursuers. An unfortunate error occurs on the first page, which is accounted for from the fact that Dr. Cordley was educated in Michigan and not in New England, like the rest of that Andover Band. Williams College will not readily give up her historic missionary haystack to Amherst.

Railway Legislation in the United States. By Balthazar Henry Meyer. [The Citizens' Library.] New York: The Macmillan Co., $1.25 net.

A careful and thorough analysis of charters and laws relating to American railways. The author points out the general resemblances of the early charters to their British prototypes, and the vast diversity of their specific provisions. The differences among them were far more numerous than the similarities. Out of the giving of these diverse charters gradually came the beginnings of the great mass of general railway legislation, State and National, that is now to be found on the statute books. The author's attitude is on the whole distinctly favorable to the railway managers. The acknowledgment is made, it is true, that "the present situation with respect to railway affairs in the United States is untenable and indefensible;" but the fault is held to lie in the harmful action of the "weak or unscrupulous manager," and not in the desires "of the majority of the officials, who would voluntarily pursue a more beneficent course." The powerlessness of the Interstate Commerce Commission to enforce its decisions, and the long period—averaging more than three years—required to get verdicts thereon from the Supreme Court, enables the one bad manager to thwart the wills of the ninety-nine good managers. The Cullom bill, a concise statement of which the author gives, would remedy matters. It would give the Commission power to order immediate compliance with its decisions, and to punish violations thereof. Up to the present, however, two Congresses have failed to pass the bill.

Vocal and Literary Interpretations of the Bible. By S. S. Curry, Ph.D. Introduction by Francis G. Peabody, D.D. New York: The Macmillan Co., $1.50.

It is not often one hears the Bible really well read in public worship, and many ministers appear to give little attention to the matter. Here is a text-book for clergymen and theological students on the public reading of the Bible by one who holds that no part of divine service is more important than the Scripture Reading. Dr. Curry is the first to prepare a text-book on this subject, but he has prepared a good one. He treats as fundamental appreciation of the function of the Scripture lesson, and insight into the literary character and spiritual quality of that which is read.

Studies in the Evolution of Industrial Society. By Richard T. Ely. [The Citizens' Library.] New York: The Macmillan Co., $1.25 net.

Professor Ely's latest work is a collection and partial rewriting of a number of recent papers and addresses, arranged to form a more or less connected exposition. The field traversed, as he says, lies in "that general borderland where economics, ethics, biology and sociology meet," tho it is, of course, from the standpoint of an economist that he treats his various subjects. It is a wide field, and all the phases of modern economic life are considered or touched upon. His well-known views reappear, with but slight, if any, modification. The beneficence of competition when properly regulated; the hurtfulness of monopoly; the impossibility of applying socialism to agriculture and the inadvisability of applying it to industry—these and a dozen more of his fixed convictions are rehandled, amiably if not always profoundly. The most important and instructive chapter is that dealing with "Industrial Liberty." Herein the author, briefly touching upon the earlier ideas of liberty, conceived largely as absence from political constraint, passes to a consideration of the more modern idea, wherein liberty is held to be a positive power, secured largely by political regulation. Of the book as a whole it is to be said that it should be widely read. Its breadth of treatment, the freshness and accuracy of much of its data, and the importance of many of its subordinate subjects, give it high value. The reader can supply his own correctives for such assumptions and conclusions as seem to him unwarranted.

Literary Notes

ACCORDING to Mr. George P. Brett, president of the Macmillan Company, the people of California buy more good books, relatively to the population, than any other State in the Union. He says further that "The Far West is full of that buoyant American spirit which believes that the strange mixture of races now going on in this country is sure to produce the strongest race the world has ever known. And the writers of California share in this optimism."

....Professor William Ives Curtiss's "Primitive Semitic Religion To-day" has been translated into German and published in an attractive form by J. C. Hinrichs of Leipzig, with a preface by the distinguished German scholar of Biblical Antiquities, Count Baudissin. The volume is an important contribution in the line with Prof. Robertson Smith's researches in Arabia, and it is pleasant to notice the recognition of its value by German scholars. We observe that Professor Schwolly, of Giessen, in the *Literarisches Centralblatt* speaks of the book as "epoch-making for the knowledge of the popular religion of the Semitic East," and adds that such studies are an even more pressing need than excavations, because the ruins will keep, while railroads and civilization will soon put an end to the old customs inherited from pagan times.

Pebbles

OF course they jockey a little, but when a preacher receives a call, or a woman a proposal, they accept.—*Atchison Globe.*

....The Union League Club of New York ought to elect a few negro members as an evidence of good faith.—*The Memphis Commercial-Appeal.*

...."What is the difference between the northern and southern shores of Long Island?" "On one side you hear the sea and on the other you see the Sound."—*Princeton Tiger.*

....St. Louis has sent a man all the way to Africa to secure pygmies for the World's Fair, evidently overlooking the specimens on the Supreme bench of the State.—*The Washington Post.*

There was a young man named Willy,
Whose actions were what you'd call silly,
He went to a ball
Dressed in nothing at all
Pretending to represent Chili.
Princeton Tiger.

....The greatest of the earthly rulers of men is Abdul Hamid, who excels in glory all former Ottoman rulers. The more the years pass the greater becomes the affection of hosts of peoples for him. When a reign is so beneficent, when the well-being of the population is so dear to the ruler's heart, the future seems full of promise.—*Constantinople Servet.*

A hustling promoter named Coe
Was head of a big cocoa Co.
A native named Koko
Said, "Pay what you owe Coe,
Or give me the Coe Cocoa Co."
He had other projects, had Coe—
Coke ovens were one line, and so
The two coalesced
Imagine the rest:
"Coe-Koko Coke and Cocoa Co!"
—*Life.*

Editorials

The Democratic Party

THE history of American political parties shows nothing more ridiculous than the flight of the terror-stricken majority of the Democratic National Committee before the boom of Mr. Hearst. It was generally expected before the meeting of the Committee that Chicago would be chosen for the convention. Only half-hearted pleas for New York were made by those who represented that city; and it was perceived that so close an association of the convention with Tammany might handicap the party during the campaign. But Chicago was quite acceptable until the alarming discovery was made that Mr. Hearst published a newspaper there with a great frequency of editions and a startling profusion of poster type, that the labor unions of the city longed to shout and vote for him, and that some Western members of the Committee were cheerfully predicting the capture of solid delegations from their States by this rising candidate. And so Mr. Gorman, Mr. John R. McLean and certain other gentlemen hastily grabbed the convention and ran away with it to St. Louis. Thus, they reasoned, they would avoid the menacing influence of Mr. Hearst's newspaper and the Chicago galleries packed with Hearst men bound to cheer for thirty minutes at every mention of his name. But they fled to no purpose. He cheerfully follows them, planning to reproduce his Chicago paper within thirty days in St. Louis, where it will greet them during the convention, in company with a local daily edition of Mr. Bryan's *Commoner*.

No professor of advertising who lies awake nights to plan schemes for catching the public eye could have devised a more effective political advertisement for Mr. Hearst. He and his aspirations became at once the subject of editorial comment and political gossip throughout the land. His boom assumed larger dimensions, and now it must be taken into account by the leaders of his party.

All this tends to remove doubts and dispel illusions as to the situation in the Democratic party with respect to the coming nomination. Mr. Bryan is not to be a candidate, but he is not politically dead. On the contrary, he is very much alive, and he intends to prevent the nomination of any one who did not support him and the platform in 1896 and 1900. This he can do if he can control a little more than one-third of the convention's delegates; for Democratic nominations are made by a vote of two-thirds. Probably his influence would be dominant over one-third of the delegates without assistance from any quarter. Suppose, however, that he should need the aid of Mr. Hearst, with whom he is on very friendly terms, and in whose newspapers he is now relating his reminiscences of the crowned heads and other curiosities of Europe.

We presume that it would be given. Mr. Hearst, thanks partly to the advocacy of Democratic doctrines in his journals, partly to the activity of his agents, and partly to the advertisement given to him by the Committee's flight, will have a considerable number of delegates in the convention. With his aid, and probably without it, Mr. Bryan could prevent the nomination of any one who is on the blacklist. And if Judge Parker, Senator Gorman, Mr. Olney, and Judge Gray should thus be excluded (for we understand that Judge Parker, although he voted twice for Mr. Bryan, is by him regarded as really the choice of Mr. Cleveland's friends and the plutocracy), there would then be a fair opening for that dark horse of whom Mr. Bryan has recently spoken. A dark horse that should come to the front under such conditions would have his approval.

There are other possibilities. The Democracy is now looking to New York and is anxious to know the views of Mr. Murphy, Tammany's new ruler. At the recent meeting of the Committee in Washington, Mr. Murphy appears to have withheld his support from all except Mr. Cleveland, knowing, perhaps, that this gentleman will not be a candi-

date and could not be nominated against the opposition of Mr. Bryan and other foes in the South and elsewhere. The Tammany chief's attitude was quite chilling to some from other States who were expecting to have their favorable but somewhat vague opinions of Judge Parker confirmed by Mr. Murphy's enthusiastic commendation. For whom does Mr. Murphy intend to use his power? This is the question for which many visiting Democratic politicians sought an answer in New York, after the Committee's meeting, but sought in vain. Some think he has in mind young Mayor McClellan.

No alliance between Mr. Bryan and Mr. Murphy can reasonably be expected, for the Tammany chief's professed admiration for Mr. Cleveland points in the other direction. Still, Mr. Murphy may eventually bring forward a candidate whom Mr. Bryan would accept. There are no indications that Mr. Hearst and Mr. Murphy can be induced to agree. On the other hand, it is said that the Hearst and the Murphy forces will soon be in conflict in many districts. Tammany methods differ from those used by Mr. Bryan and Mr. Hearst, who rely mainly upon the advocacy of certain principles or issues of broad scope. These, we presume, are not very interesting to Mr. Murphy. But at the present time he holds a political position of great strategic importance and can exercise much power. These are the three men—Bryan, Murphy, and Hearst—who will determine the choice of the Democratic party at the convention in July. It does not seem probable that their action, whether it be taken in alliance or otherwise, will be satisfactory to conservative Democrats.

It appears to have been decided that the platform's foremost issues are to be the restraint of Trust corporations and a reduction of the tariff, with special reference to those duties which enable combinations to exact high prices. The movement for Mr. Hearst, except so far as it has been caused by his agents and the amusing fright of the National Committee, is due to popular interest in these issues and to the support of labor organizations. The sentiment to which he has appealed with all the exaggeration of forcible caricature in type as well as in cartoon, is one which neither party can afford to ignore.

The strength of the President to-day among the plain people is due largely to their approval of his suits against the Beef Trust, the Northern Securities merger and other combinations. By taking the position that it is impracticable or unwise to restrain combinations by revising the tariff, and by failing to enact the Trust bills recommended by Attorney-General Knox, the Republican party left the door open for effective appeals to public opinion by the Opposition. Recent events in the history of great corporations have given new force to hostile and partisan criticism. A candidate who, though several journals, addresses such criticism to the public every day in the year, and spends his money in supporting it by actions in the courts, can have the votes of a good many people if he wants them. The issues themselves, in the hands of a united party, wisely led, would have great weight in a campaign.

A Rich Man's Government

A GOVERNMENT of the rich, for the rich and by the rich,—is that what we are coming to in this nation, which Abraham Lincoln on the battlefield of Gettysburg adjured to consecrate itself to such high tasks that a government of the people, for the people and by the people should not perish from the earth?

We must have entered upon a period when thousands of thoughtful men have drifted into an acceptance of plutocracy as a normal order of things, when the president of a great New England university—the great university of that very State which has always been regarded as more democratic in its habits and institutions than any other in the Union—can say in a public address that politics as a vocation in America should be left to rich men.

No one who knows President Hadley well, and few that have read his recent book on "Freedom and Responsibility," will question the breadth or the sincerity of his democratic sympathies. Therefore it cannot be supposed that he advises young men to make politics an avocation

rather than a vocation because he himself is satisfied with a rich man's government. He can give such advice only because he believes that we have already gone so far on the wrong road that a poor man, trying to make politics a vocation, must encounter difficulties that he cannot reasonably hope to surmount, save at the expense of his moral manhood.

We should be sorry to believe that the truth is quite so melancholy as this. To those of us who live on the Atlantic seaboard, where the power of great wealth is most obvious, it is indeed difficult to realize that there are vast areas in our country where life is yet unspoiled, and a man stands or falls according to his moral worth. It is true that when rural politicians attain that degree of political success which takes them to Washington as Congressmen or administrative appointees, they find standards of expenditure there established by the wealthy class, and discover that political life is a desperately hard struggle for the man without independent fortune. The late Senator Dawes, of Massachusetts, left a comforable legal practice at Pittsfield for a career at Washington, and his intimate friends knew well that he was often put to desperate straits to maintain his place in the political world and not yield to those questionable schemes that would have enabled him to acquire fortune through any use of his political influence. The world cannot too highly honor the men that have devoted their lives to the public service as Mr. Dawes did, as Senator Hoar has done, without suspicion attaching to their names of any concession to the mammon of unrighteousness. Nevertheless, we believe that the great majority of Americans still feel strongly that whatever the political career may be in practice, it should be regarded theoretically and ideally as one of the most honorable careers to which any boy in the land, of whatever station in life, of wealth or poverty, should be able to aspire.

To surrender this ideal would be to surrender practically everything that the founders of our republic dreamed of, that the men who fought through the wars of the Revolution and the Rebellion offered their lives for. It is plain, however, that if we are to maintain it, and to save our nation from a government by the rich and for the rich—a government under which the plain people will have such privileges as the rich graciously concede—we must soon take steps to amend many things that at present are going wrong. In a simple democracy like that idyllic community of Canton Uri, of which Freeman gives us so charming a picture, men may serve the State without appreciable reward. But in a complex nation like our own it is impossible to draw into public life men of character and talent who happen to be poor unless the State itself make suitable provision for their maintenance. The English tradition that members of Parliament should not be paid is all very well in a country still nominally monarchical and aristocratic. It is an unworkable plan in a republic.

The ineligibility of poor men to two of the most honorable offices in the gift of the State has long been recognized. The inadequate salaries of our American judges are a standing and crying disgrace. It is a shame that the disparity between the salary of a judge and the income of a practicing attorney should be so enormous that a man fitted by nature and training for the high judicial office is compelled to hesitate long whether duty to his family is compatible with service of the people. It is not less a shame and disgrace that only men of large means can aspire to the position of an ambassador of the United States to a foreign court. No man in American life has ever been better qualified for a foreign mission than George William Curtis was, and twice Curtis declined nomination, once to the court at Berlin and once to the court of St. James, because it was impossible for him to meet the pecuniary obligations of such a post. Senator Hoar declined the post at St. James for the same reason. One office only in the gift of the American people carries with it an adequate salary. When President Grant signed the bill raising the salary of the President from $25,000 to $50,000 a year he was venomously criticised by his enemies for doing an act which they described as not merely indelicate, but even reprehensible. The plain truth is that Grant never showed his stolid courage to better advantage than when he signed that bill. He knew from experience that the President could not proper-

ly maintain his office on the traditional salary, and he knew that some President must have the courage to share the responsibility of advancing it.

If we seriously intend to maintain a democratic spirit and the reality of democratic government in this country in the face of an increasing inequality of wealth, we must set about the work of advancing the salaries of all men who serve the people in a public capacity to such a level that it will be possible for men born to poverty to devote themselves to public life as a vocation, and set aside President Hadley's advice to make politics merely the avocation of the amateur.

National Aid to Public Schools

At a dinner in this city last week the work of the Southern Education Board, and of the General Education Board, controlled largely by the same persons, was under discussion. The men in special charge of the interests of these boards, including Mr. Robert C. Ogden, Mr. William H. Baldwin and Mr. George Foster Peabody, had invited to the dinner a hundred distinguished gentlemen from both North and South interested in the work of Southern education. The most interesting point in their addresses was not so much the statement, with which we are familiar, of the great educational needs of the South, as it was the suggestion coming from the Southern speakers, from Chancellor Hill, of the University of Georgia, and Professor Clayton, of the University of Tennessee, and sympathetically received by their hearers, that the United States Government ought to give aid to common school education in the South. The South, they declared, is unable because of its poverty to provide adequately for the education of the children. This, said Chancellor Hill, is "a national problem and a national burden," and "the proper relief is through legislation and national aid to remove the burden."

We hope the suggestion does not come too late. Some twenty years ago the Blair bill proposed precisely this thing, and three times it passed the Senate, to be killed in the House with the aid of short-sighted journalists and politicians of both sections, who raised the cry that it would pauperize the South. Chancellor Hill himself then opposed it, at the time when The Independent was strongly in its favor. We believed then, as we believe now, that the conditions in the South were such, following an impoverishing war, that it was the duty of the Nation, if the South would accept the aid, to assist the impoverished States in the work of popular universal education. But it was declined. The chance passed and the opportunity was lost, and we much fear it is now too late to resuscitate the plan. Its opponents in the North would raise the old cry of pauperization, and would add that the South is now gaining wealth, and is more and more appreciating the value of education, and that it is better to let them work out their problem from their own resources. On the other hand the enemies of popular education in the South are many and know how to appeal to sectional and racial prejudice. The Charleston *News and Courier* keeps attacking the Southern Education Board because of its supposed interest in the education of both races; and it attacks the Peabody Fund Board because of an idea that it is to be used for helping common school education. We notice that *The Southern Presbyterian,* a leading organ of its Church, wants the income of the Peabody Fund given to a college in Nashville, and condemns severely the proposal to "apply the funds to agitation throughout the South for better school facilities," which is the precise purpose of the Southern Education Board. It equally attacks that Board, because its ideas look to the education of all the people, which, it says, is "an unmitigated evil for both races," because "it makes the negro an anarchist, and rouses the white man to use brute force to curb the natural aspirations of the educated negro." It declares that "universal education, in any other than a pure democracy, is sure to be fatal;" and "the South is not a democracy; it is a pure aristocracy, so far as social and political life is concerned."

Such sentiments as these are abhorrent to the gentlemen under whose advice and direction the Southern Education Board is doing its work. They love their section of the country, and they honor its traditions and fame, but they do not want to see it lag behind the rest of the country. They believe in the education of all the people, and in giving to every poor child all the education he has the brains to assimilate. We believe the future of the South is with them, as it ought to be; but we doubt much if they will think it wise to press for national appropriations for the public schools, even altho Congress has given generously for agricultural colleges.

The time is passing when we need to be afraid of paternalism. Senator Latimer, of South Carolina, asks Congress to appropriate $24,000,000 for public roads. They are needed, and we believe the time will come when the Nation will own the railroads, as the States and towns own the highways. But most certainly the public schools have a higher claim than the public roads.

Social Constraint

THE questions raised in Professor Conn's interesting article on "Social Heredity" are far reaching. Most of the problems of civilization must be differently viewed, according as we believe that the inherited tendencies of family or of race determine human conduct or believe that the social environment is powerful to constrain the individual, whatever his innate character. Our expectations for the negro, for the native races of the Pacific Islands, for the defective and delinquent classes in the centers of civilization, will be small or great, according as we hold one or the other of these views.

Professor Conn has rendered a needed service in distinguishing that complex of cultural traditions and social constraint which sometimes is called "Social Heredity," from heredity in the biologist's sense of the word, or the organic transmission of qualities. Social heredity is analogous to inheritance in the legal sense, rather than to any organic process. It is the handing on from one to another, and from generation to generation, of acquisitions or possessions.

In the interest of clear thinking, and for the sake of those practical concerns to which clear thinking is indispensable, it is necessary not only to observe the distinction that Professor Conn has made, but also to ask ourselves what limitations of social influence over the individual are inseparable from its external character. No one is so blind to the commonest facts of life as not to see that in the same social environment dwell strong characters and weak characters; that under the same educational influence some men achieve great things in scholarship or in science, while others make no contribution to the world's store of knowledge, and themselves profit but little by their opportunities. There is something, then, in organic heredity which social heredity is powerless to offset or to overcome.

Without presuming to offer hasty solutions of problems that are confessedly the most difficult that science has to deal with, we suspect the truth to be that social heredity is powerless to do much more than provide a certain constraint, which obliges men to desist from courses that instinct might prompt, and persist in efforts that instinct would prompt them to abandon. This is what happens when we acquire language. As Professor Conn says, it is certain that a child will acquire the language of his parents, with whom he continually associates. Yet this very illustration brings out clearly, when we look at another side of it, the powerlessness of social heredity apart from organic heredity. In the same family different children acquire the language, the tastes, the moral standards of their parents in very different degrees. One child of a cultivated mother, whose speech is ever gracious and musical, is like her in the command of expression, while another never overcomes little faults of mispronunciation or errors of syntax.

These facts should be remembered as a safeguard against too easy discouragement when policies of educational

and social constraint seem for a time to fail of accomplishing all that we expect. They afford no ground for disbelief in the continuing uplifting of the ignorant, the continual enlightenment and moral strengthening of races emerging from barbarism. The lower races, like the civilized, are composed in part of those who can profit but little from the social constraint that is put upon them by civilization, and in part of those who have by organic heredity qualities that will respond to opportunity. And so of the masses that we call ignorant. They are not homogeneous. They differ infinitely in organic heredity. Among them are those whose potential abilities, if rightly played upon by the constraining power of an ennobling social medium, will take their places in the ranks of the benefactors of mankind.

There is one practical application of these somewhat difficult scientific principles. Whatever be the respective parts that organic heredity and social constraint play in the creation of civilization, it is certain that the part of social influence is immeasurably great. Our duty, therefore, is to see that this artificial creation, this system of traditions and constraints that plays upon the native instincts of men, and upon their infinitely varied abilities, as the natural environment also does, selecting some breeds or stocks, condemning or eliminating others, is one that shall select every quality of good, every potential power, irrespective of races or of class; irrespective of opportunities or disabilities in the past. It is a scientific error to say that because it has taken one race a thousand years to rise out of a state of savagery, another race to-day will be content to rise as slowly. Under the forces of social heredity suddenly and vigorously applied, the Japanese have in the life-time of the Elder Statesmen reversed their traditions and entered into the family of civilized nations. The same is possible for other races, and indeed all see it in process of rapid accomplishment in our own country with both Indians and negroes. Let us grant, if it be necessary, that only through the selection of individuals and stocks that have already been favored by organic heredity can civilization be maintained and advanced; it will still be true that the character of the social medium, the general scheme of social constraint, must continue to be the chief selective agency, and that whatever barriers misguided men may raise, it will respect no distinction of social caste.

Indifference to Religion

In an unusually interesting article in *The Hibbert Journal* on the alleged indifference of laymen to religion, Sir Oliver Lodge both acknowledges and denies the asserted fact. It is a matter of definitions.

Sir Oliver is one of the most competent physicists in Great Britain. Scarce any man stands higher in the esteem of scientific men. At the same time he is no materialist; he believes in God and in religion. He does not hesitate to speak his views plainly on this subject. Further, he is a man of letters. He knows how to think widely and how to write clearly. His opinions on this subject are well worth considering.

He declares that in England the intelligent classes are not indifferent to real religion, nor even to theology. Loftymindedness of any kind they value. They do not treat lightly such fundamental subjects as the existence of Deity and the relations between man and God. It is evident that they are not indifferent to such subjects, because they are always ready to read and talk about them. Politics and religion seem to be the chief topics thought worth discussing. Questions of biblical interpretation and inspiration are much considered. In Germany and France he judges that it is different, and that there the discussion of religious questions is confined to theological magazines and specialists; but perhaps he has not considered the interest taken in Germany in the "Babel-Bibel" controversy, nor among the French in Loisy's attempt to reconcile reason and religion.

But if religion means Ecclesiasticism, which is something different from the life of divine saintliness or from theology, Sir Oliver Lodge believes men are indifferent to it, and that they do not

in any great number go to church. The outward and visible forms of religion have, he says, very much lost their hold on both educated and uneducated people.

How does he explain it? He thinks that these men are so busy in their pleasures or their work that they do not find time for what they find or think unprofitable. To be sure, in this age of strenuous pressure a two hours of quiet meditation would be the best sedative and rest for men whose activities are wearing them out. So Gladstone was a faithful and attentive worshiper in church, and Sir Oliver would not be surprised to hear that the same is true of the German Emperor or of President Roosevelt, or that to them it may be a private solace.

But to most persons, he says, the Church service is tedious and unprofitable. Some men help themselves by using a Latin Prayer Book or a Greek Testament, and something of the sort is needed to keep the jaded attention fixed on old familiar formularies, recited or chanted in a meaningless manner. Accordingly most men cultivate the habit of inattention, even when reciting the worn formularies with their lips. To attend strenously to the meaning of the clauses in a creed, or even in the Lord's Prayer, is an effort not often made. Before the days of education it was profitable to let the words slip through, catching an idea now and then, but now it is tedious. He says:

"The fact is, the conventional English Church Service or eclectic admixture of combined services, is too long, and, as I think, too mechanical. The Psalter, as a whole, is oppressively tedious—I speak for myself; many of the chants one is weary of. Some of the prayers are beautiful, or would be if they were properly read and were not spoiled by such frequent iteration. The little song at the end of each Commandment is gorgeous when one hears it in the "Elijah," but it gets tiresome at the ninth repetition. The "Confession" is historically interesting and sometimes perhaps appropriate, but as a rule it is excessive and unreal; and if ever true it is not a thing one wishes to sing in public, and indeed to *sing* at all, still less to pay a few illiterate boys to sing or monotone for one.

"Constantly and rapidly repeated formularies must surely tend to become mechanical. We jeer at the Tibetan water-worked praying-wheel as a mechanical form of prayer; and yet I can imagine a peasant joyfully going on with his labor in the fields, in the consciousness that his prayer was being periodically turned up to heaven by the forces of nature, and his soul might send an aspiration after it, without interfering with the industry of the body. I doubt if such a ritual is really more mechanical than some English services that I have attended."

Sir Oliver's conclusion is, that if the Church wishes to hold active thinking men, it must "study reality and sincerity." Even if the rest of the service, in a State Church, must be fixedly repetitious, at least the sermon is free; and without over-attention to the conventional arrangement of the Church Year, which tends to laziness in the selection of topics, preachers should do their best to move the hearts of men toward a higher, more useful and unselfish life of true religion.

Doubtless Sir Oliver knows that the service, with all its iteration, is soothing and helpful to many tried and tired souls. But he is not talking of these, but of those who find it tedious and unprofitable. What he says of the English service is very nearly as true of those fixed forms which we miscall free, with so much prelude, so many hymns, so long a prayer, always coming in the same place. Doubtless we do not make enough of liberty in worship. The Apostles conducted worship differently. Our Lord, who prayed in the temple and talked in the synagog, was indifferent to the repetitious forms of Samaria or Jerusalem, but would have men worship the Father in spirit and in truth, which is what Sir Oliver means by "reality and sincerity." Real worship, with real teaching, will attract men.

International Arbitration

It was a notable conference that assembled last week in Washington for the purpose of promoting arbitration between the United States and Great Britain and incidentally the United States and all the other nations. The delegates present were not only eminent philanthropists, but representatives of great religious denominations, influential labor unions, boards of trade, chambers of commerce, etc. Altho some thought that a treaty full of "loop holes" like the Anglo-Frenc

one, described elsewhere in this issue, was all that could be hoped for at present, the majority held that the conference ought to urge an extension of the principles of arbitration as embodied in The Hague treaty, and their counsel wisely prevailed. Resolutions were accordingly adopted which if put into effect will secure an arbitration treaty between England and the United States far in advance of any now existing. If the assembled delegates represented the vital forces of the United States, this country is already in sympathy with the principle of international arbitration. It is well known that President Roosevelt and Secretary Hay are committed to the movement. England would unquestionably welcome any overtures on the subject from this country, but she could hardly be expected to make the first move after our discreditable rejection of the Hay-Pauncefote treaty. Sir Mortimer Durand, the new British Ambassador to the United States, is also known to be both personally and officially most favorable to this plan. Who then is opposed to it? The Senate of the United States? It is this body that must be converted, if a treaty is to be ratified. Now that The Hague Court is an established fact and the Alaska Boundary dispute has been settled, it would seem as though the Senate might see things in a new light. At all events if this obdurate and much criticised branch of Congress cannot be prevailed speedily to ratify such a treaty as Secretary Hay and Sir Mortimer Durand are likely to frame, the country will have something to say.

The Bacon Resolution

Senator Bacon has offered a resolution in the Senate proposing to refer to the Court of The Hague the question whether the United States owes reparation to Colombia for damage to her done by our action in securing or protecting the independence of Panama. We see no objection to that, for we want to make the most of arbitration, whether as a preventive to war or as a means to secure international justice—but, provided that Colombia first accepts the independence of Panama. That is an accomplished fact, achieved by the people of Panama, and having our full sympathy, recognized but not inaugurated by us. But as to this there is a sharp difference of view between Colombia and the United States. We declare that we have done absolutely nothing that is not justified by the law of nations and the treaty of 1846; while Colombia declares that we have unjustly prevented her from maintaining her supremacy over the Isthmus, to her serious loss and injury, such as she is entitled to go to war to assert her right. This is a question of fact and interpretation. If our officers have really done what Colombia asserts, we ought to pay damages, and if they have not done wrong, our innocence will be made clear to the world by such a reference, and we shall be on better terms with Colombia and all South America for such a decision. Accordingly, under proper provisions, we should favor such a reference to The Hague Court of the main question between Colombia and this country. Whether our officers were right or wrong, we ought to be equally ready to abide by the verdict of such an august tribunal of the nations.

Professor Briggs

A great deal more is made by some unwise churchmen than is called for of the important but not revolutionary statements uttered by Professor Briggs in a late address before the Church Club in this city, which we will publish next week. Church unity is a subject in which Professor Briggs is greatly interested, and the Club asked him to talk on the subject, developing some things said by him last summer. He did so, and he took positions which no believer in Church fellowship ought to criticise. But he did say that Presbyterian orders are just as valid as Episcopal, as any Low Churchman or Broad Churchman might say in all loyalty. To find fault with that would have driven out from the Church not Simeon and Bickersteth only, but Dean Stanley and a multitude of bishops of to-day. We need say no more now—for our readers shall have the paper in full—but we will add that any one who has talked with Professor Briggs may know that it is absurd to think that he is in any danger of going over the Roman Catholic Church,

as some of these critics suggest. On that point we speak with knowledge. He is quite too broad a man to tie himself up in that way with a Church which denies fellowship with other bodies.

Radium in Solution

Last summer THE INDEPENDENT ventured on the speculation that, since helium had been found in the waters of certain mineral springs, it might be that the curative properties of these waters were due to the presence of radio-active matter in solution. This has now been to a certain extent verified by the discovery that the water of the celebrated springs at Bath, England, contains radium and therefore gives off the radio-active emanations such as are now being used with apparent success in the treatment of various external and internal diseases, even consumption and cancer. This may settle the old dispute between the physician and the chemist. The doctors and their patients have always held that drinking or bathing in the water or lying in the mud at medicinal springs had a very different curative effect from the use of the bottled or artificial waters away from it, and therefore prescribed visits to the sanatoriums at the springs. The chemists said that the spring water contained nothing weighable or even detectable by the spectroscope which was not also in the artificial waters he compounded. As usual, both were right in what they asserted and each wrong in his contempt for the assertions of the other. Radio-activity enables us to detect matter in amounts immeasurably less than can be determined by the balance or the spectroscope and at the same time the matter possessing radio-activity has a physiological potency far beyond anything ascribed by the homeopaths to medicines in their extremest dilutions and triturations. In several of our hospitals promising experiments are being carried on by exposing water or solutions of fluorescent substances such as quinine to the action of a small tube of a radium salt in close proximity, and using the "liquid sunshine" so obtained as a medicine. The radio-activity thus induced is temporary and may be made as weak as desired.

Recreation Centers

The growth of Recreation Centers in the larger cities is one of the most encouraging features of the day. In the Borough of Manhattan these Centers were first established in 1899, with the intention of providing places for the entertainment, and indirectly for the instruction, of young people, who could in this way be drawn from the streets, and possibly from mischief and crime. The centers had hardly been opened when older people appeared, and it was thought best to admit them on equal terms with the young. The age limit is now fifty years. The centers are open from 7.30 in the evening until 10 o'clock at night. No restriction is placed on those that attend, excepting that they avoid offensive conduct; and they may come and go as they please. It is the business of teachers to see that the interest is sustained throughout the evening, and in this way regularity of attendance secured. A good degree of regularity is sustained, notwithstanding the great dissimilarity of persons and of their tastes. The yards of the school buildings are divided into two sections, in one of which will be found a thoroughly equipped gymnasium, and it is intended that each shall have shower baths; in the other part of the ground arrangements are made for quiet games and for reading. Each month about one hundred books are furnished. During 1902 there was a call for rooms to be occupied by literary clubs, and these were furnished in the upper part of the buildings. Here debates are carried on under the supervision of competent teachers. by a small tax money is accumulated for outings and other objects of a social sort. As far as possible the Recreation Center is made a social center, where all the surrounding inhabitants may find it pleasant to spend their evenings and where the old and the young will meet together. The industrial feature of the centers is not of least interest and importance. A year ago that sort of work which has characterized vacation schools was introduced, and there was a satisfactory development of carpentry, iron

working, basketry, fret-sawing, sewing, bench work, weaving and knitting and chair-caning. It seems probable that these Recreation Centers will be fully as valuable to our city population as the graded schools as centers of social life in the rural townships.

Australian Electoral Laws

The Australians claim that the constitution of the Commonwealth is the most liberal in its basis of any constitution on the planet. Both Houses of the Legislature are elected by the direct votes of the people. In the Electoral laws adopted by the first Federal Parliament the two principles of one adult one vote, and one vote one value, were embodied. The administration of these laws in the elections that have recently taken place was in harmony with their spirit as well as their letter. The registration of voters was performed with so much care and completeness that in one State, at least, the number of names on the electoral rolls was almost equal to 93 per cent. of the adult population, as shown by the census returns. Among other arrangements to suit the convenience of electors, and facilitate the full exercise of the franchise, every institution that had 100 inmates (other than criminals) was appointed a polling place. Some effects of this action may be inferred from the following notification, which was published in an Adelaide paper three weeks before election day:

"VOTING-BOOTHS AT ASYLUMS.

"The Governor-General, with the advice of the Executive Council, has approved of the establishment of the following polling-places, in accordance with the provisions of the Commonwealth Electoral Act, 1902: Commonwealth Electoral Division of Adelaide—Destitute Asylum, North terrace. Commonwealth Electoral Division of Boothby—Home for Incurables, Fullarton."

The Destitute Asylum is a purely Government establishment, provided for friendless paupers who are past work, and who are therefore fed, housed and clothed at the public expense. The Home for Incurables is sustained by voluntary subscriptions, with a small subsidy from the Government. It is a refuge for aged persons, chronic invalids, paralytics and the like, whose cases are too hopeless for ordinary hospital treatment. As these people could rarely travel any distance to record their votes, the means of doing so were taken to them. Thus a pensioner of the State, or a half-blind cripple, either man or woman, provided there was ability to mark the voting paper with a cross, had exactly the same electoral power as the chancellor of a university, a millionaire, a bishop, or a shepherd king. In their electoral laws and proceedings Australians seem to have carried out to its utmost limit the principle that one man is as good as another, and one woman, too.

President Schurman said, in an address last week, that the Philippines should not be governed outside the Constitution. There we agree with him. Their government should be brought under the Constitution as soon as the people can be made ready for it. He seemed to anticipate war with Colombia, and added:

"Once Colombia attacks, we will not stop until the flag waves over Bogota, and the past tells that it will never come down."

Perhaps our prophecy is as good as his, that, in the improbable event of war, our people and Government would under no circumstances consent to annex or make a colony of Colombia.

The most notable result of the Kishineff trials is that several of the lawyers who dared to conduct the prosecution of the murderers have been imprisoned or exiled to Siberia. Such is the grotesque administration of justice in Russia. We do not wonder that the leader of the Macedonian revolutionists declares that it would be better for Macedonia to remain under Turkish rule than to come under that of Russia, for in the latter case there would be no hope.

What probably would offend Professor Delitzsch deeper than anything else in all the criticisms of his "Babel und Bibel" is Professor Gunkel's little word: "*Delitzsch spricht mehrere Male von dem Scheol; das Wort ist femininum.*" But *Sheol* is masculine in Job 26: 6.

Financial

Financial Items

THE annual statement of the Merchants' Trust Company, of which Edwin Langdon is president, shows total assets of $4,858,571. The capital, surplus and undivided profits amount to $1,739,750, and the total deposits are over $3,000,000.

....It is proposed to consolidate the National Citizens' Bank, of which Edwin S. Schenck is president, and the Central National Bank, of which Edwin Langdon is president. The combined capital of the two banks is $2,550,000. The deposits of the National Citizens' Bank are $7,860,300 and of the Central National Bank $11,353,000.

....Bids for the $7,000,000 of Philippine land purchase bonds amounted to $40,237,000. The highest was a joint bid for all or none from Harvey Fisk & sons, Fisk & Robinson, and the National City Bank (all of New York), and the bonds were awarded to them at 107.577. The total premium received will be $530,390.

....Shipments of iron ore from the Northern Lake ranges last year were 24,300,000 tons, against 27,869,000 in 1902. A little more than half of this quantity or 12,828,000 tons, was taken from the Mesaba range, which is only ten years old. The Steel Corporation's mines supplied 55 per cent. of the ore taken out in 1903.

....George S. Hickok, who for forty-seven years has been with the National Park Bank, and since 1888 has been its cashier, has resigned as cashier but remains a director. Mr. Hickok is held in high esteem by the Board of Directors and by customers of the bank in all parts of the United States who have had business relations with him. Edward J. Baldwin, who has been connected with the Park Bank for twenty-five years and has been assistant casheir since 1888, was last week elected cashier. Lewis Cass Ledyard has been added to the directorate of the Park Bank.

....The Lawyer's Title Insurance Company of New York, of which Edwin W. Coggeshall is president, announces that with the co-operation of the counsel of the Equitable Life Assurance Society, who are also of the Examining Counsel of the Lawyer's Title Company, the real estate law business of the Equitable Life has been placed in the hands of the Lawyer's Title Insurance Company. The capital and surplus of the Lawyer's Title Insurance Company are $8,000,000. The undivided profits are $400,000. The increase in net earnings during 1903 has been over a quarter of a million dollars, and the increase in sales of mortgages over twelve million dollars.

....A few of the recent changes in the leading banks in this city, including the election to the Board of Andrew A. Knowles, cashier of the Mechanics' National Bank are as follows: Sylvester C. Dunham president of the Travellers Insurance Company of Hartford, and John Hubbard, treasurer of the international Banking Corporation, were elected directors of the Shoe and Leather Bank. Henry C. Frick and James A. Stillman, son of President Stillman, became direcors of the National City Bank. Thomas P. Fowler, president of the Ontario and Western Railway Company, becomes a director in the Leather Manufacturers' Bank. William C. Duncan, president of the Colonial Bank; William Logan and William Woodward, son of President Woodward, become directors of the Hanover National Bank. William K. Vanderbilt, Jr., a director in Lincoln Bank, and Chas. P. Armstrong, H. T. Morse and F. L. Eldridge become directors of the Mercantile National Bank. The new directors of the Consolidated National Bank are: W. O. Allis, J. B. Curry, D. S. Dunn, O. M. Farrand, G. B. Hagerty, C. Pugsley, L. V. F. Randolph and Charles E. Sprague. The new directors of the Phenix National Bank are William T. Minor, George H. B. Mitchell and Henry W. McVickar.

....Dividends announced:

Northern Securities Co., 1½ per cent., payable February 2d.

Atch., Top. & S. F. R'way Serial Debenture Coupons, payable February 1st.

Atch., Top. & S. F. R'way Serial Debenture Bonds, payable February 1st.

Insurance

Life Insurance and Life

Mr. Darwin P. Kingsley, Vice-President of the New York Life Insurance Company, is an enthusiast on life insurance. He mingles pleasure with his business and likes to talk shop. Not very long ago Mr. Kingsley made an address on life insurance and life before the Eastern $100,000 Club (New York Life Insurance Company) at Atlantic City, New Jersey. His exposition of the principles and practice of life insurance was luminous, and there were many truths set forth by him. According to Mr. Kingsley the revelation which life insurance brings forth does not attack any theory of the Hereafter, but it reverses all existing theories about the present. It exalts life. It emphasizes the vast importance of the present and it clothes the passing hour with a new dignity. It also creates an intense belief in life itself.

The Mutual Life Insurance Company of New York have issued a policy for $500,000 to Charles Netcher of Chicago, proprietor of The Boston Store. Mr. Netcher is fifty, and his annual premium is $19,940, the policy being an ordinary life, non-participating one, with the privilege of transfer to a higher form. The Mutual Life Insurance Company have issued policies for a million dollars each to George W. Vanderbilt, John M. Mack, of Philadelphia, and Frank H. Peavey, of Minneapolis.

Insurance Statements

THE HOME INSURANCE COMPANY, OF NEW YORK.

The one hundred and first semi-annual statement of the Home Insurance Company, published on another page, shows total assets of $18,040,793.99. This is an increase, since the statement published twelve months ago, of $1,732,158. The net surplus is $6,574,751.49. The surplus as regards policyholders is $9,574,751.49, or $138,713.49 greater than last year. John H. Washburn is President of the Home Insurance Company, and Elbridge G. Snow is Vice-President.

THE GREENWICH INSURANCE COMPANY.

The assets of The Greenwich Insurance Company, organized in 1834, according to the sixty-ninth annual statement of the company, are $2,120,003.97. The company has a cash capital of $200,000.00 and a surplus to policy holders of $358,163.77.

CONTINENTAL INSURANCE COMPANY, NEW YORK.

The statement of the Continental (Fire) Insurance Company, of which Henry Evans is President, shows assets of $14,192,175, an increase of $1,234,336 during the past year and a net surplus of $6,563,428, an increase of $844,466. The increase of premiums written in 1903 over 1902 is $408,467, and the increase reserve for insurance in force for the same period is $326,343.

HOME LIFE INSURANCE COMPANY.

The forty-fourth annual statement of the Home Life Insurance Company, of which George E. Ide is President and William M. St. John is Vice-President, contains some interesting figures. The total admitted assets of the company are now $15,102,840.60. This is a gain of $670,624 during the interval since the last report was issued. The present net surplus is $1,126,769.73. The Home Life Insurance Company now has 38,105 paid policies in force, which is a gain of 3,486. The paid-for insurance of this company now in force is $69,410,582.

THE WILLIAMSBURGH CITY FIRE INSURANCE COMPANY, OF BROOKLYN, N. Y.,

has a very favorable showing in its fifty-first annual statement, dated December 31st, 1903, that has just been published. The company has increased its reinsurance reserve by $91,783.12, and its reserve for losses unpaid, taxes, commissions and all other liabilities by $13,378.07. The net surplus of the Williamsburgh City is now $1,230,653.06. Its total assets are now $2,465,415.09, as against $2,390,737.49 last year. The President of the company is Marshall S. Driggs.

THE ÆTNA INSURANCE COMPANY, OF HARTFORD, CONN.,

in common with many of the other insurance companies, has had a very prosperous year. Its report, issued on January 1st, shows a cash capital of $4,000,000.00, and a net surplus of $6,060,737.71. The total assets of the company are $15,190,888.15. Its surplus as to policyholders is $10,060,737.71. This company has paid losses during its eighty-five years of existence amounting in total to $96,328,139.96. The gains of the Ætna in various departments have been considerable, as the subjoined table will show:

Gain in assets	$241,367.17
Gain in surplus	38,134.35
Gain in net premiums	87,901.51

The company has increased its reinsurance fund and other liabilities by $203,232.82. It has suffered from a shrinkage in the market value of stocks and bonds held by it of $667,245.00. Wm. B. Clark is President and W. H. King Secretary of the company.

The Independent

Vol. LVI NEW YORK, THURSDAY, JANUARY 28, 1904 No. 2878

Survey of the World

Mr. Bryan and His Party

Some Democrats in the Eastern States who were beginning to think that Mr. Bryan was willing to make concessions for the sake of harmony, have been greatly disappointed by his speech at a banquet in Lincoln, on the 18th, when 700 of his friends in Nebraska welcomed his return from Europe. In that address, having remarked that "we find corruption everywhere," and that the cause of it was the commercial spirit which he saw in the tariff, our financial system, imperialism, and the trusts, he asserted that the only remedy was an appeal to the moral sense of the country. The Democratic party could not make such an appeal successfully if it should change its attitude toward any great question with the hope of appeasing somebody:

"Shall we abandon our advocacy of bimetallism in order to conciliate those who defeated the party in other campaigns? Never! Some phase of the money question is always before Congress, and no one can predict when the coinage phase of it will again become acute. No reform of any kind would be possible with the money changers in control of the party. The Kansas City platform is sound in every plank; and the first act of the next Democratic convention should be to reaffirm it in its entirety; and its next act should be the addition of new planks in harmony with it. Then the convention should select candidates who believe in the platform, and the committee should announce that it will neither ask nor receive campaign contributions from those who are intrenched behind the bulwarks which we are attacking."

In his newspaper he has proclaimed his purpose to "make an uncompromising fight for candidates in full and sympathetic accord with the platforms of 1896 and 1900." The great issue, he says, is the one between man and Mammon, democracy and plutocracy, the old struggle "between the common people and organized wealth." Returning last week to the East, he has since been emphatically aggressive, predicting that the Kansas City and Chicago platforms will surely be reaffirmed, and attacking the prominent Gold Democratic journals, in which complaint is now made that conservative Democrats do not stand up and reprove him. Some of these journals say that the party can be saved only by casting him out, and that, having been defeated twice, his aim is to prevent the election of any other Democratic candidate. He has hired a hall in New York and has invited the clergymen of the city to hear a lecture which he is to deliver on "The Moral Issue." In many other places he is to make similar addresses. Democratic journals that oppose him have questioned members of Congress and influential politicians as to the policy of reaffirming the old platforms. The answers show that it is disapproved by a large majority.—At the annual dinner of the Holland Society, in New York, Mr. Bryan was a prominent speaker, following James M. Beck, formerly Assistant Attorney-General, who denounced "the tyranny of the boycott," defended non-union labor, and quoted Mr. Bryan's recent remark about the "struggle between the common people and organized wealth," saying that "this line of cleavage between the classes is as mischievous as it is lacking in justification," and that no greater injury could be done to the American people than by "throwing the firebrand of class hatred" among them. In reply Mr. Bryan, at the close of his

address on "Peace," spoke at length in defense of labor organizations, pointing out the good which they had accomplished, and saying that "we are more likely to suffer from the organizations of capital, that plunder stockholders and patrons, have no conscience, and constantly defy the law," and from the use of money in debauching politics, buying votes and corrupting legislators for the purchase of franchises.—In an article on "Socialism and the Labor Unions," contributed to a magazine, Senator Hanna, after reviewing the course of the Civic Federation, says: "I took some time to consider the work of the Federation, and am firmly convinced that it is the object to which I desire to consecrate the remaining years of my life."—The Republican delegates in Florida have been chosen, and all of them are instructed to vote for Mr. Roosevelt. The President has declined to exert any influence in behalf of Senator Foraker's contention for the instruction of Ohio's delegates, and it is said that they will be controlled by Senator Hanna, but in the President's interest.—General Black, recently appointed a member of the Civil Service Commission, has been arguing before a Senate Committee in support of the bill to pension every surviving Union soldier of the Civil War who served 90 days, and is 62 years old, at the rate of $12 a month. Estimates of the annual cost of such legislation range between $20,000,000 and $48,000,000.

The Panama Controversy

The new Panama Canal treaty was reported from committee in the Senate on the 18th, with three amendments relating to sanitation and the control of terminal harbors for improvements. Mr. Morgan complained loudly because more time had not been given to him for preparing and proposing additional amendments. It soon became known that the President and his Cabinet preferred that there should be no amendments whatsoever, because the addition of them to the treaty would delay final ratification. This was also the attitude of Minister Bunau-Varilla, who is said to have remarked that amendments made at Washington might cause other amendments to be attached at Panama. Such action would require a second debate and vote in the Senate. It was practically decided, therefore, that the three committee amendments should be dropped, assurances having been given in behalf of Panama that the control sought by them would be granted on the Isthmus.—At a conference of the Senate Democrats on the 19th, it was agreed that certain Democrats (said to be Messrs. Mallory Simmons, and Clay), who had intended to speak in support of the treaty, should refrain from doing so until after the Government's reply to pending resolutions of inquiry; and a committee was appointed to prepare a new resolution of this kind, including all the essential parts of those already before the Senate. This new resolution may refer to the charges published by a New York Democratic paper, to the effect that the revolution was promoted and financed by a group of speculators in Paris and New York, who were represented, it is alleged, by M. Bunau-Varilla, and who have made large profits by the advance in Panama Canal Company shares. It is expected in Washington that 12 Democratic Senators will vote for ratification.—In the Senate last week, the course of the Government was defended by Messrs. Quarles, Spooner, O. H. Platt and others. It was attacked by Messrs. Patterson and Morgan. Mr. Tillman remarked to an inquiring journalist that he did not intend to make a speech, but should sit through the debate and "throw rocks at the thing as it went along." Ratification, he thought, could not be prevented. Mr. Morgan caused some surprise by introducing a bill providing for the annexation of the Isthmus and for the construction of a canal on the Panama route; and appropriating $10,000,000 to be paid to Panama for annexation, $15,000,000 to be paid to Colombia for loss of territory, and $40,000,000 for the purchase of the Canal company's rights. "We ought," said he, "to take the whole Isthmus, since it is evidently the settled and determined policy of the United States to build a canal at Panama." Some questioned his sincerity, however, because at the same time he introduced a resolution directing the President to negotiate with Nicara-

gua and Costa Rica for a canal on the Nicaragua route. He had heard, he said, that the President had agreed to pay Colombia $15,000,000. The repeated assertions of the opposition that the President had connived at the revolution led Mr. Platt, of Connecticut, to say that these assertions were a national disgrace. The people, he continued, believed that Mr. Roosevelt was honest; they knew he was not a man who concealed his opinions or acts. He was brave and fearless, not rash and impetuous; he did the right thing at the right time. On the 22d the Senate passed Mr. Gorman's long resolution of inquiry, which calls for the official record of our Government's action on the Isthmus under the treaty of 1846 during the last fifty years. There was no opposition after a few changes suggested by the Republicans had been made.—It is reported in Panama that public sentiment at Cartagena and other points on the coast now opposes war, and that many soldiers who went to Titumari have returned in poor health, having been unable to endure the climate and a shortage of supplies. Newspapers in Bogota, it is said, urge conciliation, and a prominent citizen has published a letter there, saying that war might cause the secession of Cauca.—At a conference held on the 23d, the Democratic Senators decided to support a resolution calling upon the President for all the official correspondence relating to the canal question since the negotiation of the treaty with Colombia. Mr. Gorman's policy was sharply opposed by several Senators, who expressed the opinion that the American people could not be induced to believe that the President had connived at the revolution.

Correspondence with Gen. Reyes

Additional correspondence between General Reyes and Secretary Hay has been sent to the Senate. Under the treaty of 1846, which provides that in case of violation of that treaty the injured party may submit to the other a statement of grievances, General Reyes offered such a statement, long and historical. The treaty was rejected at Bogota, he said, because of Minister Beaupre's threats, but Colombia had decided to propose a new one. Panama became independent because the United States desired this, had prevented the landing of troops, had its war ships at hand, and had thus taken from Colombia "by bloodless conquest, but by conquest nevertheless, the most important part of the national territory."

"Sad indeed is the fate of my country, condemned at times to suffer calamities from its own revolutions, and at others to witness the unexpected attacks of a powerful but friendly state, which for the first time breaks its honored traditions of respect for right—especially the right of the weak."

He hoped, however, for justice, trusting that "that Government which has so many times surprised the world by its wisdom will, on this occasion, astonish it by its example." In closing, he asked that the controversy be submitted to The Hague Court. In reply, Secretary Hay said he saw no occasion for a resort to The Hague Court and did not regard Colombia's complaints as having any valid foundation. He expressed surprise that General Reyes, relying upon newspapers, should make "gross imputations upon the conduct and motives" of our Government:

"Any charge that this Government, or any responsible member of it, held intercourse, whether official or unofficial, with agents of the revolution, is utterly without justification. Equally so is the insinuation that any action of this Government, prior to the revolution in Panama, was the result of complicity with the plans of the revolutionists. . . . By the declaration of independence a new situation was created. The Isthmus was threatened with desolation by another civil war. Nor were the rights and interests of the United States alone at stake. The interests of the whole civilized world were involved. The Republic of Panama stood for those interests; the Government of Colombia opposed them. Compelled to choose between these two alternatives, the Government of the United States, in no wise responsible for the situation that had arisen, did not hesitate. It recognized the independence of the Republic of Panama, and upon its judgment and action the Powers of the world have set the seal of their approval."

In a later note General Reyes entered his "solemn protest against this denial of justice by one of the most powerful Governments in the world, bound by its very power to be equitable," and

gave notice that Colombia, inferring that her troops upon entering the Isthmus would be attacked by the United States, would hold our Government responsible for loss of territory. Mr. Hay replied that if Colombia should persist in assuming a hostile attitude, "it will be only after the most careful deliberation, and with extreme reluctance, that this Government would shape its course in accordance with the deplorable conditions thus created." He suggested that a plebiscite be taken on the Isthmus and that the differences between Colombia and Panama be submitted to arbitration.

Indictment of Senator Burton

Joseph R. Burton, United States Senator from Kansas, was indicted by a grand jury of the Federal Court at St. Louis, on the 23d, for accepting five checks of $500 each from the Rialto Grain & Securities Company while holding the office of Senator, between November 22d, 1902, and March 26th, 1903, as payment for his intercession with the Postmaster-General and other officers of the Post Office Department concerning a decision, already made or impending, withholding from this company the use of the mails. At the time of these payments, Mr. Tyner, afterward dismissed and indicted, was the officer to which such questions were referred. The Rialto Company has been the subject of investigation in the State courts of Missouri, at the instance of Attorney Folk, who also proceeded against another similar company, which had published a letter of recommendation from Senator Burton. The Senator says that as an Attorney employed by the company he received the money; and that while it is true that he inquired at the Post Office Department whether a fraud order had been issued against the company, he made no effort to influence the Department's action. The statute governing this case is the one under which ex-Congressman Driggs was convicted.—During a debate in the House, last week, Mr. Bartlett, of Georgia, asked the clerk to read a letter which he had received from M. W. Louis, recently dismissed from his office in the Post Office Department. In this letter Louis asserted that Fourth Assistant Bristow's report as to his appointment was misleading, saying that he had come in and been transferred under a prevailing and not unlawful practice. He added:

"Under that practice Mr. Bristow himself injected into the classified service, without examination, more than thirty persons, and among them his own father, who was appointed as a $600 laborer on March 5th, 1901, charged to the Sixth Congressional District of Kentucky, and who now draws $1,600 as a post office inspector in the Denver, Col., Post Office, and also his own son, who, during his school vacation, drew a salary at the rate of $720 a year in the post office at Washington, D. C. It is not amiss to state that even now Mr. Bristow's father is not performing inspector's duties, and that the son performed no work at all to warrant the payment of a salary."

Mr. Bristow says that his father and son were regularly appointed, and denies that either of them has been paid for service not performed.—It appears that in October last Mr. Holmes Conrad, special counsel for the Government, told General Payne and Mr. Bristow that the evidence against Perry S. Heath was sufficient to warrant the submission of it to the grand jury for Heath's indictment, and that District-Attorney Beach declined to make such use of it, disagreeing with Mr. Conrad and assuming all responsibility for this decision.

Navigation Laws for the Philippines

Senator Frye's bill prohibiting the transportation of merchandise between the Philippines and the States except in American ships, after July 1st next, under penalty of forfeiture, is opposed by the cordage manufacturers and by Secretary Root. Last year, only one-tenth of the stores forwarded to the islands for the army and the navy was carried in American ships; and all of the coal, about 60,000 tons, was transported in foreign vessels. At last week's hearing before the Senate Committee, the Eastern manufacturers of cordage asked that such an application of the coastwise navigation laws be deferred until 1909, asserting that the enactment of the pend-

ing bill would transfer the market for Manila hemp from New York and Boston to London, and ruin the cordage industry, the annual output of which includes $27,000,000 worth of farmers' binding twine. They were willing, they said, to make five years' contracts with American ships for the transportation of hemp at rates 10 per cent. higher than those they are now paying to foreign ships, if this were practicable; they would even submit to an increase of freight charges by 25 per cent., rather than be subjected to the restrictions of the Frye bill. They appeared to expect that the increase would be 100 per cent. if the bill should become a law. As there were few American ships available on the Atlantic coast for this trade, they predicted that the bill would transfer to the Pacific coast so much of the industry as should survive. It would also destroy their export trade in binding twine and other products. On the other hand, a Maine ship company asserted that it could carry all the hemp, but gave no prices. A ship company at New York told the committee that it had ships for the coal trade, although its rates would be from 25 to 50 per cent. higher than those which the Government now pays. The cordage manufacturers admitted they were associated in an organization—it was not a Trust, they said—by means of which they agreed as to the prices of their products.

M. Combes Long before the close of the year it was predicted that the fall of the Combes Cabinet was imminent. Later this was modified to the statement that it was already discredited, but that M. Combes would retain his position as a matter of form long enough to take part in the New Year's receptions and to bestow then certain decorations which he had promised. We are now well along in the new year, and he still holds his heterogeneous supporters together sufficiently to give him a clear majority of fifty to sixty in the Chamber of Deputies whenever he calls for the order of the day, even when that cuts short an exciting debate on his policies. He has just weathered a storm of criticism from the Nationalists for his expulsion of Abbé Delsor as he was about to deliver an address at Lunéville against the closing of the schools of the religious orders by the Government. Abbé Delsor is an Alsatian and a deputy from Molsheim in the Reichstag, and to have him expelled from France on the ground of interference in the domestic politics of the country implies that he is a foreigner and recognizes the separation of Alsace-Lorraine from France as an accomplished fact. M. Combes refuses to entangle himself with the politics of dead issues. He states that modern republican France stands for peace and is deaf to the war trumpet blown by the Nationalists. Peace is at once the first duty and first need of nations, and France is working for peace and arbitration, not because she is weak and irresolute, nor because she is strong and determined, but because it is a moral obligation of a democracy.

"Royalty by right divine, formerly so nobly personified in the Comte de Chambord, died a melancholy death in exile, and there is no fiction in the world capable of unsealing the tombstone which covers the remains of its last representative. The Empire ended as it deserved to end. Born of perjury and of military sedition, it perished by the arrows of savages in the obscurity of a warlike adventure. The death of Orleanism was not less lamentable."

Monarchism being dead and Nationalism impotent, there remains of the enemies of the republic only the last, Clericalism, to fight.

French Socialists At the same time that M. Combes was being accused by the Nationalists of being a traitor to the traditional policy of "revenge" he was attacked by the radical wing of the Socialists for not disavowing the conduct of M. Lepine, Prefect of Police, who by the energy with which he put down the Paris riots of last December has been nicknamed "the Fouché of the Republic." But M. Combes shouldered the responsibility for the acts of his subordinates in Paris as in Lunéville, and in an appeal to the Chamber received the support of the customary majority. M. George Clémenceau has placed himself in decided opposition to the extreme anti-clerical policy of M. Combes, taking his stand on liberty as the only true principle of republicanism.

In his opinion a monopoly of teaching by a State university is just as dangerous to freedom of thought as a monopoly of teaching by the Church schools. Some philosophy, some dogmas, some views of history must be taught; no school or teacher can be neutral in the discussion of disputed points. The fault, he says, of men of Latin mind is the pursuit of unity, instead of allowing the growth of diversity through liberty. "We escape the Church only to fall into the arms of the State." Man was ignored by antiquity, which absorbed him in the State. It was the French Revolution that discovered the individual and gave him his rights. The present policy of the Government is reactionary and is adopting the old weapons of persecution and suppression of those who will not adopt its dogmas as infallible. On the same ground of interference with liberty of opinion and speech M. Clémenceau objects to the recent expulsion of M. Millerand from the Socialist party. M. Millerand was Minister of Commerce in the Waldeck-Rousseau Cabinet and is one of the most able men in the moderate or "parliamentary" wing of the Socialist party. Because he refused to vote for the proposition that France should initiate the policy of disarmament without waiting the action of other nations, the Socialist Federation of the Department of the Seine (Paris) has excluded him from the party. He voted instead for the more practical motion that France would associate with any other European nation which would agree to disarm. M. Jaurès, a leader of the Moderate Socialists, was not re-elected one of the vice-presidents of the Chamber of Deputies on account of a group of radical Socialists joining with the Opposition to defeat him.

Spain The Republicans in Spain at each successive election show an increase of power, especially in the cities, and in the last Congress they were able by means of the tactics of obstruction and with the aid of the Democratic Liberals to cause the resignation of Señor Villaverde. This has resulted in the formation of a still more conservative cabinet under the leadership of Señor Maura, a former Liberal. The policy of economy and internal development of the former Government is abandoned. The chief efforts of the present administration will be to reconstruct the navy of Spain at an expense of $60,000,000, of which $16,000,000 is to be used for arsenals. Four cruisers and forty auxiliary vessels are asked for. It is pointed out by the Opposition that to fortify such important posts at Rosas, Mahon and Cartagena, and to make Ceuta, opposite Gibraltar, absolutely impregnable would make Spain much more desirable as an ally to either France or England than any navy she can afford to build and maintain. The new Minister of Agriculture, Señor Allendesalazar, has ordered all work to be stopped on the system of country roads connecting the villages and chief towns, which his predecessor, Señor Gasset, had begun to develop. There are now only about 7,500 miles of country roads in Spain, while France has some 300,000 miles, and nothing is more essential to its commercial progress. The present reactionary administration will also attempt to deprive the villages of a large part of their power of self-government. It is not expected that the Cabinet will last very long, as the Prime Minister has aroused great opposition by appointing to the bishopric of Valencia Father Nozaleda, who was Archbishop of Manila at the time the Americans captured that city, and who is regarded by the Spanish people as a traitor on account of his friendly relations with the Americans in the Philippines. The prospective coming to Spain of the 6,000 friars who are about to leave the Philippines is looked upon as a great calamity by all parties.—It is proposed to marry the young King Alfonso XIII to his cousin, Maria del Pilar, daughter of Prince Ludwig of Bavaria.

Russian Peasant Laws The first step has been taken toward carrying out the reforms in the laws relating to peasants recommended by the Czar in his manifesto of last March. Government conferences are to assemble to draft laws for European Russia with the following aims:

"First—To harmonize the existing peasant legislation with modern requirements.

"Second—To reorganize the courts in order to expedite the settlement of village disputes.

"Third—To define individual rights regarding communal lands.

"Fourth—To discover means for stimulating individual enterprise and the adoption of modern farming methods.

"Fifth—To settle disputes between the peasants and neighboring landowners.

"Sixth—To urge on the peasants respect for the laws and rights of property."

The peasants themselves are not directly represented in these conferences.

British and Russian Power in Persia

Lord Curzon is an adept in the use of the pageantry which is so necessary in the government of Orientals. His Durbar was the most magnificent ever given in India, and in his recent tour of three weeks along the Persian Gulf he utilized the same ceremonial to impress upon the local chiefs the importance of British favor and friendship. In his speeches he reviewed the history of the British power in the Persian Gulf for more than a century and called attention to its services in the suppression of piracy and the slave-trade and the development of commerce. Notwithstanding the importance of British interests in this region, as necessary for the protection of the route to India, and the fact that during the last century English troops have repeatedly occupied many posts along the Gulf, yet these have been voluntarily evacuated as soon as possible and no Viceroy of India has ever before paid an official visit to the t wns on the Persian Gulf. In spite of Lord Curzon's diplomatic visits and addresses it is doubtful whether the English can regain the influential position which they formerly had in Persia and which they have so largely lost through the commercial invasion of Northern Persia by the Russians. Englishmen obtained a consession for a railroad from Teheran to the Karun; Russians obtained one for a railroad from Teheran to Resht. The former failed for lack of financial support; the latter succeeded by means of a Government subsidy of $750,000. When the present Shah, Muzaffer-ed-Din, wished to borrow money he applied first to England, but was refused on the ground that the security was not sufficient. When he turned to Russia, however, he secured a loan of $12,500,000 and pledged himself that until 1910 he would not borrow any money except through the Russian bank. The Persian troops are drilled by Russian officers and the provinces of Aderbaijan and Mazanderan are practically under the control of Russia.

Korea

The past week has been a quiet one in regard to the situation in the Far East. The censorship of the press is very strict both at Port Arthur and Tokyo, and only Seoul, apparently, remains open. At the Korean capital, in spite of Japanese and Russian intrigues at the palace, and the constant efforts of the newspapers to incite the people to riots against all foreigners, there have been no very serious outbreaks. An accident on the electric street railway, which is owned and run by Americans, caused the death of a Korean. The car was attacked at once by a mob of natives and completely destroyed, but the marine guard of the American Legation saved the operators and checked the mob without using firearms. The Korean Government has issued a proclamation of neutrality in the case of a war between Russia and Japan; a measure of which the Russian Government has expressed disapproval.—Yi Yon Gik, the Korean Minister of War and Finance, who has been arming the troops with rifles and the populace with revolvers, is reported to ha e been deposed from his office by the Emperor.

Russia and Japan

Two reports were current during the week, which at the time of going to press had neither been confirmed nor disproved. One was that the Japanese had landed 10,000 to 12,000 soldiers at Masanpho, in Southern Korea, and the other that t ree thousand Russian troops had c ossed the Yalu River from Manchuria into Korea. More reliable is the information that Russian soldiers have been withdrawn from Tien-Tsin and other Chinese cities and concentrated in Manchuria. New-Chwang is now occupied by 6,000 Russian troops, and the city is managed by a Russian commis-

sioner. The Manchurian railroad is with great difficulty protected from the attacks of Chunchuses, or Chinese marauders, and it is reported that large quantities of dynamite have been found under the bridges, by which railroad communication could be at once broken by Japanese gents in the event of war. The Japanese residents near Vladivostok were attacked by Russian marines, and men, women and children killed and maltreated. No reply has yet been returned to the last Japanese note, but from Paris it is announced on good authority that Count Lamsdorff, the Russian Minister of Foreign Affairs, has control of the negotiations and the approval of the Czar and is working for peace, while Admiral Alexieff, Viceroy in Manchuria, is discredited. The two Japanese cruisers h·ve left Aden for the Far East, and are followed by the Russian fleet of two battleships, nine torpedo boat destroyers and a collier, which passed later through the Suez Canal. The Japanese Minister of Finance will issue a loan of a hundred million yen.

German Southwest Africa

The Hereros of German Southwest Africa have risen and settlers have been murdered and homesteads burned in isolated places. The insurrection had evidently been carefully planned long before, but so secretly that the missionaries and settlers were completely surprised and the outbreak was arranged to take place when the larger portion of the colonial troops were carrying on a campaign against the Bondelzwarts tribe, twenty days' march away. The Hereros surrounded Okahandja, a mission station of Damaraland, about 150 miles inland from Walfish Bay, the British port, and Swakopmund, the German port, and by destroying the bridges and telegraphs and twenty-five miles of the railroad, cut it off from the capital, Windhoek, and the coast. There was great danger that Okahandja and Karibib, and possibly Windhoek would fall into the hands of the natives but a force of 120 men under Lientenant Zülow fought its way through Waldau and relieved the garrison at Okahandja. The number of natives is estimated at 30,000 to 40,000 and they are well armed and mounted. There are only about a thousand German troops at hand and Chancellor von Bülow appealed to the Reichstag for an appropriation to dispatch reinforcements. The Reichstag immediately authorized supplementary credits of $705,300, and 500 marines with six machine guns and six pieces of artillery were sent at once on a North German Lloyd liner, which will arrive at Swakopmund about February 8. In 1888 the chief of the Hereros refused to continue the mining concessions and all the Germans in the interior were forced to take refuge in Walfish Bay.

Somaliland

The British forces in Northeast Africa have at last succeeded in dislodging the Dervishes from the Jidballi water-hole, which is in a clump of bush surrounded by open veld. The attempt made a month ago to surprise them by an attack on the camp from both flanks was a failure, as the natives were three deep in a line 1,500 yards long and the Mullah was only eight hours' march away. On the morning of January 11th the British returned to the attack with a force of 2,200 Regulars and 1,000 Irregulars. When they came within 700 yards of the enemy the Dervishes were no longer able to endure the fire from the infantry in front and the charge of the cavalry on the flanks, but broke and fled to the hills. They were pursued for two miles by the mounted troops and a thousand of them killed. The total force of the Dervishes is estimated at about 5,000.

Aalesund Burned

Aalesund, a seaport town in Norway of some 10,000 inhabitants, was completely destroyed by fire on January 23d. Twenty fishing boats and three steamers in the harbor were burned. There was very little loss of life, but property to the amount of over $4,000,000 was consumed, as the fire attacked every building inside of two hours, and the people were left without protection The German cruiser, " Prinz Heinrich," one of the Hamburg-American and one of the North German Lloyd steamers were at once dispatched, at the request of Emperor William, to Aalesund with supplies and medical stores.

How May We Become More Truly Catholic?

BY CHARLES A. BRIGGS, D.D.

[This article is the paper read by the Professor of Biblical Theology in Union Theological Seminary before the Church Club in this city, which has given occasion for severe attacks upon him by a number of High Churchmen, who declare that a man with such views has no right to remain in the Episcopal Church.— EDITOR.]

I.—APOSTOLICITY.

APOSTOLIC, in historic usage, stands for the inheritance of Christianity from the apostles of Jesus Christ—apostles being understood, not in the limited sense of the Twelve, but in the larger sense, including St. Paul, St. Barnabas, St. Timothy, St. Titus, St. Clement, and others, mentioned in early Christian literature as having the authority from our Lord Himself to be the teachers and founders of the Church. Those who would be truly Catholic therefore must first of all share in this apostolic inheritance, and the larger their share, the more they realize it and use it, the more truly Catholic they become.

This generation is intensely concerned with all that is Apostolic. No other generation has ever given so much attention to the investigation of the origins of Christianity as this generation.

(1) Many scholars, chiefly German Protestants, are pressing the inquiry, What is the Essence of Christianity? That question we are compelled to consider, partly because all the religions of the world are now brought into comparison with Christianity, and the distinction must be made between those things that are common with other religions and those which are the special characteristics of the Christian religion. This leads on to the further question—how much of our historic Christianity was derived from Greek Philosophy, from Roman Law, from Oriental Mysticism, and what was the residuum that came from the Apostles? Furthermore Christianity is divided into so many different organized Churches, so many different parties in these Churches, that it is necessary to determine what is essential to Christianity in order to know whether these are truly Christian or not, and how far they are possessed of genuine Christianity. To many minds such an investigation is disturbing, because from the necessity of the case the greater part of inherited Christianity must be put aside as irrelevant to this investigation—as not belonging to the essentials; but nevertheless it is an investigation that must be pursued to the very end, in order that we get down to the bed rock of Christianity, the corner stone of the entire structure. This will be found, I am convinced, in the mystic fish, the favorite symbol of the ancient Christians, inscribed all over the catacombs; on tombs, and in chapels alike, the ἰχθύς = Ιησοῦ Χριστὸς Θεοῦ Υἱὸς Σωτήρ "Jesus Christ, the Son of God the Savior." That is the essence of Christianity. Whoever knows that by practical experience and personal knowledge is a Christian. Other foundation can no man lay than this, for the Church as for the individual. That is the essence of our Apostolic inheritance.

(2) But it is not sufficient to know the essence of Christianity; it is necessary also to know the whole of it. Therefore the next step is to master the teaching of Holy Scripture. This is the problem of the discipline known as Bibical Theology, which aims to give the exact, the entire teaching of Holy Scripture, and distinguish it from all other teaching whatsoever—to give the teaching of Holy Scripture in its original meaning to those who wrote the Scripture, and distinguish this carefully and thoroughly from all later interpretations, logical deductions and elaborations. Only by the use of Textual Criticism, the Higher, or Literary Criticism, and Historical Criticism used in the exactness of the modern

inductive, scientific method, can the whole Apostolic inheritance, as recorded in Holy Scripture, be ascertained. This is also a painful process to many minds; because it is necessary to put aside a multitude of things which Christians hold sacred and dear which cannot in fact be found in Holy Scripture, although imperfect methods of Bibical Study in the past have found them there.

(3) But even if we had the entire Apostolic inheritance as given in Holy Scripture, clearly defined and agreed to by Christian Scholars, we would not then have the entire Apostolic inheritance. Many of the Reformers were here mistaken. They thought that they could reform the Church by rejecting everything not to be found in Holy Scripture. Thus Cartwright, the father of English Puritanism, thought it absurd that Christ should not deck his bride, the Church, with all her ornaments at the original institution of the Church, and he rejected everything not to be proved from Scripture, as human invention and corruption of the primitive institution. But in fact by false methods of Biblical Study he found many things in Holy Scripture that modern Bibical scholars cannot find. Biblical Criticism has made it certain that you cannot build Christianity on the Holy Scriptures alone. It is necessary also to determine the Christian inheritance in unrecorded apostolic tradition. The Anglican Reformers are justified in this respect over against their Puritan opponents. It is true, nothing is to be required of any man as necessary to salvation, that cannot be proved from Holy Scripture. But there are many things that are of great importance in Christian doctrine, life and organization, which must be sought, and can only be found, in apostolic tradition, such as appears in the documents of the Ante-Nicene Church. Those therefore who would be more truly Catholic must estimate and use the contribution to our knowledge of apostolicity in the Ante-Nicene Christian Literature.

(4) But having gone so far, have we reached the limit in our investigation of the Apostolic inheritance? If it is true that the Apostles left a sacred deposit in the Church to be used throughout its entire history, it was not to be laid away in a napkin, to be preserved in its original integrity as a sacred treasure; it was given to be used, to be increased, developed, enriched by usury, and that not by one generation, or by the Ante-Nicene Church merely; but by the Church of all ages, each adding its increment to the Apostolic inheritance;—not new doctrines,—not new institutions; but the development, the application to new times and circumstances and conditions, of the original institutions and doctrines. Therefore the contribution of the thousand years and more of the Christian Church subsequent to the Nicene Council and prior to the great Reformation of the 16th Century cannot be safely ignored if we would be more truly Catholic. In this respect all the Reformers were at fault, the Anglican no less than the Swiss and German. They ruthlessly broke with the pre-Reformation Church. They threw away and trampled under foot the wealth of Christian knowledge and experience which had been gained during a thousand years of Christian history. They did not give sufficient heed to our Lord's Parable of the Tares. They tore up by the roots the golden Christian grain together with the tares of human invention and fancy. The Anglo-Catholic movement, which began with the Oxford School, is therefore a genuine and all important movement for the recovery of a vast Christian treasure. Doubtless many of this party are simply blind partisans, mere reactionaries and, without discriminating between that which is precious and that which is vile, would restore the whole fabric of pre-Reformation Christianity. But Historic Criticism has the field here, as in the study of Holy Scriptures and early Christion literature, and it is entirely practical, with a right Christian perspective, to put all these facts in their proper light and relations.

If we would be more truly Catholic, therefore, we must not be narrow and partisan, but broad, truth-seeking and irenic, using all the resources of modern Historical Criticism to ascertain truly all the facts of the case, so that the modern Church may possess itself of the entire Apostolic inheritance, and enrich itself with the wealth of all the Christian centuries.

I have thus far said nothing of the Apostolic succession of the Holy Ministry, upon which Anglicans lay so great stress. Indeed, it is only an incident, in a vastly greater whole. The Anglican complacency in the Apostolic succession of the ministry of the Church of England received a rude shock when Pope Leo XIII, after a careful and searching historical investigation, declared Anglican orders invalid. From the Roman point of view, his decision cannot be successfully disputed. If it be necessary to a valid Christian ministry that it should be the intention of the ordinal to ordain a real sacrificing priest, I have not the slightest doubt that Anglican orders are invalid, because the Anglican Reformers had no such intention. Anglican orders can be vindicated only on the ground that it was the intention of the Anglican Reformers, in their ordinal, to ordain such a reformed ministry of deacons, priests and bishops, as they supposed was the genuine Apostolic inheritance. If they made a mistake in omitting the important element of the sacrificial character of the priesthood, it was a mistake of ignorance, and not of wilful disobedience to their Lord.

But if Anglican orders must be defended on this ground, so can Lutheran and Presbyterian orders, for the Lutheran and Calvinistic Reformers were just as sincere and desirous of loyal adherence to the Lord's institution as were the Anglicans. If their orders are regarded as more defective than the Anglican, yet their intention was substantially the same.

We should consider the historical situation when the Churches of the Reformation were separated from Rome and compelled to become national Churches. The Anglican episcopal succession depends upon a very slender thread. Not one of the four bishops who consecrated Archbishop Parker had jurisdiction in any of the historic sees. Queen Mary died in 1558, only 42 years of age. Her sister, Elizabeth, lived to her seventieth year. If Mary had lived only twelve years longer only one of Parker's consecrators would have been living, and in all human probability it would have been impossible to have secured a sufficient number of bishops to consecrate a bishop independent of Rome. If England had been called upon to choose between a Reformation without bishops or bishops without Reformation, can we think she would have chosen the latter?

The situation on the Continent was somewhat different. Hermann, Archbishop of Cologne and Elector of the Empire, a man of greater eminence and nobler Christian character than the Archbishop of Canterbury, began the reform of his diocese in 1536. In 1542-3, with the aid of Bucer and Melancthon, representing the two sides of the Reformation on the Continent, the Lutheran and the Reformed, he became a champion of the Reformation and was followed by the Bishop of Munster and others. But the German Emperor, by force of arms, deprived him of his electorate and archbishopric and destroyed the Reformation in his Electorate. If Maurice of Saxony had thought more of his religion and less of his personal animosities, and had led the Protestants against the Emperor at this time, instead of five years later, the Archbishop of Cologne would in all probability have been the great leader and mediator of the Reformation on the Continent.

It was, indeed, the providential interference of God in cutting short the life of Queen Mary, and postponing the Protestant rally about Duke Maurice, and not the deliberate choice of the Reformers, that made the Church of England Episcopal, and the churches of the Continent non-Episcopal. The situation might have been the very reverse.

Under these circumstances it is altogether unhistorical and unbecoming for the Anglicans to exalt themselves above their Protestant brethren on the Continent, as if they alone had the true Apostolic Ministry. It was due to the short life of Queen Mary and the long life of Queen Elizabeth that England was saved from the religious wars that for a generation devastated the Continent, and out of which the Protestant Churches emerged in feebleness and poverty to do the best they could under the circumstances. All churches should consider how to make their ministry more truly Catholic by a recovery of all its genuine characteristics and by lifting it to the ideals of Christ and his apostles.

II.—UNIVERSALITY.

The second constituent element of Catholicity is Universality. This is indeed its original and central meaning. When the Christian Church was organized on the day of Pentecost, the divine Spirit in Theophany distributed Himself upon a multitude of old and young, male and female, masters and servants; and His endowments were communicated to Parthians, Medes, Elamites, dwellers in Mesopotamia, in Judea and Cappadocia, in Pontus and Asia, in Phrygia and Pamphylia, in Egypt and the parts of Libya about Cyrene, and sojourners from Rome, both Jews and proselytes, Cretans and Arabians. (Acts 2: 8-11), instituting a world-wide Church. When these scattered abroad to their widely separated countries, they no more broke the unity of the Church in the Apostolic Ministry than the Jewish Dispersion throughout the world, broke their unity in the temple at Jerusalem.

The New Testament knows of but one Christian Church. It is impossible to find anywhere in the New Testament, or in primitive Christianity, the idea of a national Church, distinct and independent of the Universal Church.

How can any one doubt that Jesus and his apostles instituted one, and only one Church, which was to be in organic unity, notwithstanding its world-wide diffusion among all nations. This unity in universality is not a unity of identity, or of uniformity, or of abject obedience to absolute authority; but a unity in variety. The New Testament exhibits different types of doctrine among the apostles themselves. Primitive Christianity exhibits a great variety in its institutions. Christianity as world wide is divided as the waves, but united as the sea—divided as are nations by rivers and mountains, but united on the one solid earth.

It never was conceived that the universality should be absolute, but relative. Jesus and his apostles predicted that the Church would be troubled with heresy, schism, and apostasy. Never has the Church been so troubled by these evils as in the second and third centuries, when it fought a life and death struggle with Gnosticism; but it came out of the struggle with its unity and universality unimpaired.

When we look over the Christian world to-day, we must lament the failure of the Church in this element of Catholicity. The Roman Catholic Church claims to be the only truly Catholic Church. Its claims are certainly better sustained in the element of universality than those of any other Church. She is nearest to the ideal. She can say that by direct and unbroken inheritance she maintains her Catholicity, and that it has only been impaired by schismatic churches who have departed from her, not she from them. When her claims in this respect clash with the Anglican claims for Apostolicity, Newman shows us that an earnest and logical mind must eventually go to Rome. If it be Roman Universality against Anglican Apostolicity, there can be no doubt which will win. But, in fact, Anglican Apostolicity is not Apostolic enough, and Roman Universality is not universal enough. Roman Universality by no means corresponds in all respects with the primitive Catholic ideal.

Augustine's sentence is sublimely true: *Securus judicat orbis terrarum.* England and every other land must bow to the final judgment of the Catholic world. But the Catholic world was not in the sixteenth century, and has never since been, covered by the triple crown. The Universal Church was not represented in the Council of Trent, and has not been represented in any modern council. The final judgment of the Catholic world can be delivered only by the whole Catholic Church. The judgment of the Roman Catholic Church cannot be final to the Greek and Oriental Churches, or to the Protestant Churches. These, in fact, constitute a much greater portion of the Christian world than the Roman Catholic, and cannot be left out of consideration when Christian Universality is in question.

In fact, the Medieval Church had more zeal than discretion. She was too often like the fiery sons of Zebedee, ready to call down fire from heaven to consume those who were not quite ready to acknowledge her claims or grant full hospitality to her decisions. The Church developed more rapidly in the intensification of her doctrines and institutions than in her extension of them to the

outer circles of her own circumference; and so she lost her solidarity. Our Lord, the divine Teacher, reserved many things that He could not teach the Twelve, whom He had chosen to lay the foundations of the Church. He said in the last discourse: "I have yet many things to say unto you, but ye cannot bear them now, Howbeit when He, the Spirit of Truth is come, He will guide you into all the truth." But the teachers of the Church lacked the Master's wisdom. They had little consideration for the incapacity of mankind to advance in holy things. They tried to compel men to accept their decisions of all important questions, relating to life, doctrine and institution, on their bare absolute authority, without giving sufficient evidence, without hearing valid objections, without giving time for reflection, without respecting scrupulous consciences, without even making their own decisions sufficiently intelligible, and without waiting themselves for the guidance of the divine Spirit, who alone can teach the teachers of the Church when to teach that which the Christian people can assimilate and use.

That which is truly Catholic, *quod ubique quod semper quod ab omnibus creditum est*—was submerged in an ocean of scholastic subtilties and ecclesiastical eccentricities. That which is truly Catholic had to be drawn out of the mass of uncatholic material which the Roman Catholic Church still exacts of all who submit to her authority. Let the Pope limit his authority to those things that are truly Catholic, and let him make a sincere and loving effort to rally all Christian Churches to that and that only, then there will be no further reason for the existence of national Churches.

The Anglican Church, by her insular position, and the stress of historical circumstances, became a national Church, and emphasized her nationality at the expense of her universality. She not only separated from Rome, but held aloof from the Reformed Churches of the Continent. She exchanged papal absolutism for the tyranny of the Crown and prelates, and these so insisted upon uniformity, that they compelled large sections of the English people to dissent and non-conformity; and so the Church of England, tho established by law, has become the Church of the minority of the people of the British Isles, and is in throes of anguish, surrounded by a multitude of enemies who will not give her the autonomy she needs to allay the internal strife which threatens her existence, unless she will forego all the advantages of that very thing on which she has ever prided herself of being, the National Church.

But there is another and more hopeful side. The Church of England and her daughter in this country have been broadened by the discipline of history. She is now, notwithstanding her isolation, in an intermediate position, in which she may become the peacemaker of the Churches. There is greater diversity in the Anglican Church at the present time than in any other body. There are those who are straining every nerve in their reaction toward Rome. There are those who are striving to bridge the stream that separates them from the Non-conformists. There are others who seek, above all, fellowship with the Greek and Oriental Churches. God speed them all! If we would be truly Catholic, we should stretch forth our hands frankly and cordially to all the sister Churches of Christendom. We should break down the walls of prejudice, remove all misunderstanding and misinterpretation. Let us emphasize the consensus, those things upon which we agree. We should put our dissensus where it belongs, in a subordinate place. What is the consensus, that in which all agree, but that which is truly Catholic? What is the dissensus, that in which we do not agree, but that which is not truly Catholic?

The dissensus is that which needs reconsideration, reinvestigation, in an irenic temper, and with a truth seeking spirit, to solve the difficulties, to remove the differences, in order that we may eventually agree. The Consensus and the Dissensus will be calmly and patiently investigated, without heat, in the discipline of Theological Symbolics, and eventually will be stated in a scientific and accurate system.

In our attitude toward the Roman Catholic Church we should frankly recognize the mistakes of the Reformers; that Rome can teach us many things we

ought to learn, and we should strive to restore to our Church, at least for optional use, everything that is truly Catholic. In our attitude toward the sister Protestant Churches we should give up once for all and forever the prejudices born of the civil wars of the seventeenth century. Anglicans ought not to hesitate to follow many of the ablest of the Anglican divines, and agree to the validity of Presbyterian and Lutheran ordination.

The question is often asked, How may we bridge the gulf between Protestantism and Rome? It cannot be done on the level of past controversies, or of present differences. How has the East River been bridged? At first two huge towers are built on each side of the river, then a slender wire is stretched from the top of these towers; this wire gives place to cables, then a foot bridge is made at this great elevation. Then months of labor are necessary from this higher level before there can be constructed at the lower level the great highway which combines the two sides in permanent union. So will it be with the Church. We must rise above the present low level of doctrine and institution into higher and more comprehensive positions, and then some Reformer, called of God, will discern some simple principle which will become the first line across the chasm, and then the bridge will follow in good time.

The antithesis of the sixteenth century are to a great extent antitheses of one sidedness, which the modern world has outgrown. The world has moved since then. The world has learned many things. We have new views of God's universe. We have new scientific methods. We have an entirely different psychology and philosophy. Our education is much more scientific, much more thorough, much more accurate, much more searching, much more comprehensive.

All along the line of life, institution, dogma, morals new situations are emerging, new questions pressing for solution; the perspective is changed, the lights and shadows are differently distributed. We are in a state of enormous transition, changes are taking place whose results it is impossible to foretell—reconstruction is in progress on the grandest scale. Out of it all will spring, in God's own time, a rejuvenated, a reorganized, a truly universal Christianity, combining in a higher unity all that is true and real and worthy in the various Churches which now divide the world.

The great temple of Christianity has not yet reached its completion, it is in course of erection. The builders are separated in different bands under different leaders, building up its great walls over against each other. The time is at hand when they must be united. Some more comprehensive principles will appear, which will be as it were the ribs of a great dome that will overarch the whole and combine all sides in the one Catholic Apostolic Church.

III.—HOLINESS.

The third constituent of Catholicity is Holiness. This is the feature which was the earliest to emerge, in the New Testament itself. This is the feature which is the most essential and the highest. Whatever other elements of Catholicity a Church may possess, if it lacks this, it fails in the most essential element. This is the vital principle of Catholicity, unity with our Lord Jesus Christ in the ethical unity of love, and in the religious unity of the Holy Eucharist.

The great Reformation of the seventeenth century had its historic necessity in the failure of the pre-Reformation Church to be truly Catholic in just these respects. For several generations the Church had been in throes of Reformation; not only in the struggles of a host of Reformers before the Reformation to purify the spiritual life of the Church, but also in the efforts of great reforming councils, Pisa, Constance and Basel. But all in vain, the Papacy was the fountain source of corruption, and the Popes refused to reform themselves. "They shut the Kingdom of God against men. They would not enter themselves, neither suffer them that were entering to enter."

In Germany, Martin Luther, an Augustinian monk, doctor of theology and professor in the University of Wittenberg, was confronted by Tetzel, a coarse Dominican monk, to whom had been committed by the Archbishop Albrecht of Mainz the sale of indulgences in Germany for the rebuilding of St. Peter's at Rome. His preaching and conduct were most scandalous. Luther,

as an authorized teacher of the Church, was simply doing his duty in opposing him. But, unfortunately, Tetzel was sustained by an unscrupulous Archbishop, and finally by the Pope; and Luther was compelled to defend the Holy Church against the Pope himself. He appealed from the Pope ill-informed to the Pope well-informed, and finally to a Christian Council. What were the Reformers of Germany to do under these circumstances?

As Dr. Schaff says: "The Roman Church at the critical moment resisted reform with all her might, and forced the issue: either no reformation at all, or a reformation in opposition to Rome." The Reformers were compelled by the Pope to choose between a Holy Church without universality and a corrupt Church having universality; between the Pope and Jesus Christ; between the Holy Scriptures and the Church; between an enlightened Christian conscience and submission to an absolute immoral will; between vital union and communion with the living God, and a communion with God which could only be secured through the mediation of a corrupt priesthood.

It is possible that the German reformers should have been more patient, that they should have gone on waiting as did their predecessors; that Luther might have served his generation better by dying at the stake rather than by rending the Church. But, in fact, the German Reformers, in the interest of a Holy Church, became Protestants; and their protest remains valid until the Church of Rome becomes once more not only Catholic in the sense of universality, but also in the sense of a truly Holy Church.

The divorce of Queen Catherine from Henry the Eighth was an unholy deed, disgraceful to Cramner and to the English Reformation. But underlying it there was a principle of essential importance—namely, whether the English crown was to be subordinated to Papal authority, and its interests sacrificed for Roman politics. On that question the Papacy was in the wrong, and the English people were not in rebellion against the Catholic Church when they insisted that the supreme jurisdiction of the Church did not extend into the sphere of civic government. It seemed to most of the English Reformers that it was necessary to sacrifice Catholic universality in the interests of national autonomy. The Holy Church had been submerged in Rome in a vile Macchiavelian State. The Popes of the sixteenth century exhibited more of the spirit of the Cæsars than of the Apostles of Christ. The English Reformation at its start simply followed the command of Jesus: "Render unto Cæsar the things that are Cæsar's and unto God the things that are God's."

The Christian principle of authority is the authority of love, the authority of truth and justice. So far as the successor of St. Peter held supreme authority, according to primitive Christian thought, it was a primacy in love. The Pope as successor of St. Peter was *servus servorum,* the greatest of all as being the servant of all. The Papacy had become by gradual usurpation the very reverse of Jesus's institution, *dominus dominorum,* lording it over kings and emperors to an extent conceived only by the arch-tempter of our Lord himself.

St. Peter, in spite of faithful warning, denied his Lord. He was sifted as wheat by Satan, but his faith did not fail; he repented and, strengthened his brethren as the heroic leader in the first establishment of the Christian Church. St. Peter's successors, in spite of like ample warning, could not resist the devil when he showed "all the kingdoms of the world and the glory of them." The Papacy made a still more disastrous fall, which weakened the Catholic Church, retarded its growth for centuries and brought it to the brink of ruin.

England, as it seemed at the time, had to choose between the lordship of the Pope and the Lordship of Christ; between Canon Law and God's Law; between the liberty of sonship to God and the bondage of papal absolutism. It is possible to think that the English Reformers should have been more patient, that they should have used spiritual forces only, that they should have preferred death at the stake rather than have relied upon absolute monarchs and self-seeking courtiers, and be compelled to share in a reform which was, in its civil relations, downright robbery of God and murder of holy innocents. But, in

fact, when forced to meet the issue the English Reformers bravely met it. They determined upon Reform with the best weapons they had at hand. They sank deep in the mire of civil corruption, but they gave us a reformed national Church of England. The papacy cannot excuse itself from blame for whatever evils sprang out of the situation, which it forced upon British Christianity.

We are now in the twentieth century, not the sixteenth. The situation has entirely changed. Rome no longer defends Tetzel, or the abuses which provoked the Reformation in Germany. Rome has been chastened by the discipline of history. Every shred of temporal power has been stripped from the papacy. No country is in any peril of papal usurpation. It is true that in St. Peter's on great functions one hears the roar from assembled pilgrims and clerics, "*Viva il Papa Re.*" But this is a theatrical display, a mere outburst of popular enthusiasm, having no reality in it. It is safe to say that if the Catholic Church of the sixteenth century had been what the Roman Catholic Church is to-day there would have been no such rupture of the Church as took place in the great Reformation. Doubtless many serious differences have since emerged, which must be removed ere union is possible. But the original differences no longer exist, in any practical form. Why should we live on forever in the shadow of past controversies and raise up dead issues as obstructions to the reunion of Christianity and its progress in the modern world?

There were other and in some respects greater Reformers in the sixteenth century than the more popular heroes, Luther, Zwingli and Cranmer. Sir Thomas More, the greatest jurist of his time, Lord Chancellor of England, a chief leader of reform before Cranmer, resigned his exalted position and went to the block rather than recognize the supreme authority of the King in ecclesiastical affairs; a true knight, a martyr to the separation of civil and ecclesiastical jurisdiction. Erasmus, the greatest scholar of his age, regarded by many as as the real father of the Reformation, the teacher of the Swiss Reformers, was unwilling to submerge learning and morals in an ocean of human blood. He urged reformation, not revolution. He has been crucified for centuries in popular Protestant opinion as a politic time-server, but undoubtedly he was the most comprehensive reformer of them all.

John von Staupitz, Doctor of Theology, Vicar-General of the German Augustinians, the teacher of Luther and his counselor in the early stages of his reform, a man without a stain and above reproach, a saint in the common estimation of Protestant and Catholic alike, the best exponent of the piety of his age, was an apostle of Holy Love and good works, which he would not sacrifice in the interests of the Protestant dogma of justification by faith only.

These three immortals, who did not separate themselves from the Roman Catholic Church, who remained in the Church to patiently carry on the work of reform therein—these three were the irenic spirits, the heroic representatives of all that is truly Catholic, the beacons of the greater Reformation which is impending.

The situation in the Christian world since the sixteenth century has been, so far as Catholicity is concerned, a distracted one. The three constituent elements of Catholicity have been used in different degrees and proportions. If Rome has stood for Universality, the Anglicans have emphasized Apostolicity, and the Lutherans, the Reformed, and the Puritans have insisted on the Pure doctrine, the Holy Discipline and a consecrated life. Have they not each in their way been enriching the great conception of Catholicity? Have they not each their contribution to make to the Catholic Church of the future? When once the great fundamental Catholic principle of Holy Love has become the material principle of entire Christianity, it will fuse all differences, and, like a magnet, draw all into organic unity about that center where Love itself most truly reigns.

Nothing in this world can stand against such a Catholic Church. She will speedily draw all mankind into the kingdom of our God and Saviour.

New York City.

Bishop Greer

BY WILLIAM R. GIVENS.

THE consecration on last Tuesday morning of the Rev. David Hummell Greer, D.D., LL.D., Rector of St. Batholomew's Protestant Episcopal Church, as Bishop-coadjutor of the Diocese of New York, occurring in that church of which for fourteen years he has been rector, was an occasion of large interest to a circle larger than that embraced alone by the confines of that diocese or even of that one communion. In New York City the Episcopal Church has been for many years deservedly famous as being foremost among all denominations in two extreme regards: in the patronage it has enjoyed of the rich, and in the service it has rendered to the poor. The choice by this diocese of its Bishop from this especial parish, then, which for ten years has been known, on the one hand, as one of the wealthiest of the "wealthy churches," and, on the other hand, as the leading "institutional church" in America, brings this man into prominence at this time as a veritable Captain of Religious Industry.

DAVID HUMMELL GREER

Dr. Greer, altho a man mature in both experience and judgment, is still a young man, both in looks and years, and should have many years left yet to live and work. Born in 1844, graduated from Washington and Jefferson College in 1862, from the Divinity School of Kenyon College, Gambier, Ohio, in 1866, and ordained to the priesthood the following year, he has since had such a ministerial career as was calculated both to deepen and broaden him. He has served three congregations: First, one in Covington, Kentucky, for two years; then Grace Church, Providence, Rhode Island, for sixteen years, and St. Batholomew's since 1888. He has also before declined three other bishoprics; that of Rhode Island in 1897, that of Western Massachusetts in 1901 and the proffered coadjutorship to Bishop Whitaker of Pennsylvania in 1902. But when, on the 23d of last September, he was unanimously chosen by that convention, the unanimity of all "parties" in which choice was illustrated by the fact that he was nominated by Dr. Dix, the decidedly "High Church" Rector of Trinity Church, and the nomination was seconded by Dr. Huntington, the pronouncedly "Broad Church" Rector of Grace Church, he accepted that which no man could decline. His acceptance also was in language so modest, tender and solemn that all who heard him were agreed his words bespoke his honest attitude: "I did not seek this, and I did not want it. . . . I was happy and contented in my field of work, and hoped in that field to have filled up the full measure of my usefulness to my God and to my fellow men. It breaks my heart to leave it. But you have called me."

The work that, as Rector of St. Bar-

tholomew's, Dr. Greer has done in these years past is confidently looked on as presage of what he will be able to do in the greater field of the diocese of New York in the years to come. The transformation wrought in that parish during those fourteen years has been wonderful, considered even in itself; but it is chiefly interesting as an illustration of that revolution which has come about in just those years in the methods of all modern city church work. Some one has described that parish when he came to it as "a mere ecclesiastical club house, open once a week and closed between times so tightly that one could not have gotten into it with a can opener." But half its pews were rented, and these were but half filled—even on "ladies' days." Now it is open every day in the week; its pews are not only all rented, but there is a long waiting list; its average Sunday congregations are the largest in the city; its communicant list numbers more than 2,000 names; it has five mission congregations, with a Sunday school each, which in as many different languages minister to at least a part of New York's polyglot population; its parish house on East Forty-second Street covers almost an entire city block, and in and out of the doors of that house there pass 5,000 people every week.

The very existence of that "House" is an augury to those who know of it, as the scale on which work there is done would be a revelation to those who do not. Here are housed under one roof a Working Men's Club of 600 men, with gymnasium, library and reading rooms; a Boys' Club of 500 boys, with a cadet battalion and other minor sub-societies; a Working Girls' Club of a thousand girls, with night school classes in cooking, sewing, calisthenics, etc.; an Employment Bureau, where 5,200 of the city's unemployed have found work in one year; a Loan Bureau, where, in the form of mortgages on household furniture, $88,970 has been loaned in sums averaging $98.74 in one year, and a Clinic, where in that year 53,073 patients have been treated. There is also a Working Girls' Boarding House in Forty-sixth Street, a Summer Home at Washington, Connecticut, where 300 women spend two weeks each, and a Fresh Air Farm at Elmsford, New York, where 400 children spend the same amout of time each summer. The simple enumeration of all the societies connected with this parish fills two closely printed pages of the New York Charities Directory, and the full account of their working a Year Book each year of 300 pages.

It goes without saying that the doing of this work costs money—how much is suggested by four items from the "summary" of the Treasurer's printed report for last year:

RECEIPTS FROM ALL SOURCES.

Pew rents, etc.	$64,686.79
Offerings, donations, income from legacies, etc.	151,953.74

DISBURSEMENTS FOR ALL PURPOSES.

For objects in the parish	$170,750.86
For objects outside the parish	36,434.42

The property value of the church's "plant" is several million dollars, the parish house also being endowed in the sum of more than half a million dollars. These figures and the names of donors back of them necessitate the parish being, and they justify its being, called "The Millionaires' Parish." Among the vestry representative names are those of Mr. James W. Alexander, Mr. W. W. Appleton, Mr. George A. Crocker, Mr. Frederic Cromwell, Mr. George H. Morgan, Mr. William D. Sloane.

The Treasurer is at once the Treasurer of the Amalgamated Copper Company; chairmen of committees are presidents as well of banks; the roster of the Missionary Society reads like a page from the Social Register, and dozens of pew holders own also the New York Central and a dozen other railroads. The man whom fortune has placed in this environment and ability has raised to the head of this institution must of necessity be one who is of the firm conviction that "There is no virtue in poverty; there is no crime in wealth. It is the vulgar ostentation caused by, and the display of wealth, and not its possession, which causes social unrest." He has simply constrained men of wealth to put their money at the service of God and their fellows.

Of course, these facts in themselves are only facts; they have no significance except as illustrating some phenomenon. The thing back of them which they do

illustrate and which alone can vitalize them is the personality of the man who has been able to develop this energy and to correlate these forces. The man is one possessing a combination of qualities rarely found together; one of those whose psychological portrait it is not easy to paint. That portrait is interesting chiefly because it is so elusive; it is elusive because the very traits which in him seem to have spelled Success in others have as often spelled out Failure—and *vice versa*. He is a man in whose career the ordinary facts have wrought without the ordinary corollaries, one in whose character each element has been developed because of, and not as usual in spite of, its very complement; for they break all coteries, defy all catalogs and seem bound all in incongruity. He is a man of gentlest manner, kindliest spirit and intensest sympathy, yet earnest, strenuous and practical; a man of exceptionally sentimental disposition, yet of as exceptionally sound judgment concerning men and things; a man who gains his ends usually because he bides his time, and yet withal an indefatigable worker; a preacher whose pleading is so forceful that great multitudes are drawn by it, yet one whose treatment of a theme most "scholars" would dub superficial; an orator with a voice so powerful as to be famous, yet with an enunciation so faulty that at times his words are indistinguishable to half his congregation; a writer of choice diction, yet so given to mannerisms as at times to be even ungrammatical; a churchman cautiously conservative in public utterance and orthodox in private faith, yet one so liberal in methods and so ready to adopt expedients as to shock whole classes of reformers by having billiard rooms, card tables, cigar counters, dancing classes and a Sunday playing football team in and connected with that Parish House; a man as full of surprises as of excellencies yet of sterling qualities as striking contradictions—such a man is Bishop Greer.

Just in proportion as by the wording of those phrases I have failed to make their content clear, I have succeeded in that paragraph in drawing a true picture of a man who is great because he has been true rather than consistent, who has been successful because that his dreams have happened to become his duties. Forecasting his future career in his untried office, there are two or three traits which are sufficiently marked to warrant their continuance and to insure their abiding value.

One of them is this: On the night after the election spoken of above, at a reception tendered to the clergy of the diocese by Bishop Potter, a man who stood by, looking on, comparing the Bishop and the Bishop-coadjutor Elect, who stood together to receive, comparing and contrasting the two men with each other and with the clergy about them, commented: "Dr. Greer has no sense of humor." This is true in the sense that it was meant—fortunately for him, from the point of view of any man's success in this profession. That is to say, he takes both himself and his profession seriously. This any man in the ministry must do. He must deal oftentimes with people who are foolish, deal with them in matters that are often trivial, tolerate at times much eccentricity and bear more times with manifold peculiarities. The man who can do this naturally saves himself much labor—the labor of pretending that he does so. The ability to do this very thing has been indeed in no small measure the secret of this man's success.

Another thing that is expected of a bishop is that he shall be facile in public address—especially impromptu address. If it is true that "An orator is one who has learned and forgotten every rule of oratory," such is in no small degree the case with Dr. Greer. He is especially happy in being able to rise to an occasion on occasions which are of sufficient importance to make a speaker entirely forget himself. This will be attested by all those who heard, for example, his eulogy on Mr. McKinley the day of the memorial service held after the Martyr President's assassination; his memorial to the late Cornelius Vanderbilt on the day of the dedication of the memorial doors erected at the church's entrance in his memory some six months since; his speech on the proposed amendment of the canon dealing with divorce at the General Convention in San Francisco two years ago, and the brief address in

terms of which he accepted his election to this office in the Church of the Heavenly Rest last September.

But the crowning quality of any man in any office is, when all is said and done, a moral quality. This, in felicity let it be heralded, those who know New York's Bishop-coadjutor best all unite to declare he has as few men have. In any search for secrets about his success, *the* secret is an open one. It is simple. It is this: He is a *good* man. It is the confidence rich men have had in his integrity—and this alone—that has made them make of him their almoner. It is this that has won for him such a wealth of loyal affection as has been showered upon few men, either in the ministry or out of it. It is this that has now overflowed the limits of one parish and bids fair to exceed the bounds of a whole diocese, even of a whole denomination. If it does, none will be more ready to congratulate that diocese and that denomination than those who are at present just outside its pale.

NEW YORK CITY.

The Real Southern Man

[We printed last week an article, entitled "The Southern Man," by a Northern woman for several years a resident in the South. This week we print a reply by a Southern woman. We do not say who gets the best of the argument.—EDITOR.]

LEARNING deprives some people of imagination. It gives them the crawling, nearsighted mind and endows them with a hypercritical faculty as the only means of intellectual expression. Persons of this class fail to comprehend the Southerner, because he does not belong to their world of ideas. He would be somewhere in the regions of their dreams if they had dreams. He is an unreality to them. If I should say to such a critic, "It is necessary to appreciate the Southern man in order to understand him," he would miss the real point of my observation and comment upon the inversion of my logic. "How can one appreciate what one does not understand?" This kind of mental integrity is incurable because the imagination has been destroyed. Such a man does "his own thinking," of course, but the trouble is he has nothing of his own to think about. His mind was made up for him by a college faculty, certified to by a "diploma," and warranted to reach certain conclusions so long as he lives. He cannot understand any condition or any man who does not conform to what he "studied." These are the people who sit in judgment upon everything Southern with a sense of omniscence that would be amusing if it were not so disgusting. And they are pathetically unconscious of the impression they produce upon the unenlightened Southerner.

Recently a Northern lady and her husband were conversing with some Southern friends, when one of the latter, having long since caught the keynote of their minds, maliciously used a well thumbed, pedantic phrase to convey a copy book moral. The Northern guest started as if she had heard an echo from her native land, turned to her husband and remarked with the air of a missionary commanding a heathen, "She has expressed a *wholesome* idea, Mr. H.!" Mr. H. is disposed to herald with enthusiasm any dawn of intelligence in the darkened Southern mind. "Now tell me, my dear lady," he exclaimed, taking the wicked one by the hand encouragingly, "tell me exactly how you reached this very creditable conclusion. I never heard such a sentiment in this section before, it's—er—encouraging!" And she told him such a moving fiction that his eyes filled with thankful tears. But this insolence merited the deceit practiced upon him.

From this simple illustration the incompetence of many of our critics may be inferred. Their censure is not the result of malice, but of academic provincialism and of invincible ignorance con-

cerning every class of men and things not laid down in their theoretical way bills of life.

It is true that we have "wildcat orators" among us. The war deprived the Southern man of his wealth, but he can still speak with the tongue of men and of angels from any convenient stump or from the gallery of a crossroads post office. Meanwhile, the record of the reconstructionists in the South proves that he is not the only man in this country shortened by "false standards of honor." And it is true that our editors still write "fire breathing" editorials and "gush about the sanctity of womanhood," but if any one wishes to risk the "fire" or test the genuineness of the "gush," let him appear in the open and question either. Also, some professors among us are working *too* hard for "an educational ideal," which is not indigenous to this section. But when one of these is imprudent enough to *show* his ideal, we get rid of him even if we resort to guile, as did the trustees of Trinity College the other day in the case of Professor Bassett. They did not turn him out, but they left the door *wide open.* In the end he will go. Already his grass withereth.

Considered as a Southern factor, the Southern man is abnormal, because he has survived the civilization that created him, and has not accepted the civil conditions that now constrain him. Peculiarly endowed with the instinct to govern, he has lost the chairmanship of national affairs. But if he governs less, he lynches more, for he has a temper that may be trusted to even up things one way or another. According to the history of a conquered people he should have adopted by this time the sentiments and opinions of the victorious North. However, the dangers of his situation forced him to regard as the most abominable heresies what is there reckoned as fundamental principles of political righteousness. The very truth must be acclimated, shaded with the color line, before he will accept it. And the wisdom, even the virtue of his position, is easily proved: Had he submitted to the inevitable at the close of the Civil War, accepted the conditions imposed upon him by merciless victors, and docilely adopted the ethical conclusions of the abolitionists, by this time his legitimate grandsons would have been mulatto barbers shaving Yankee deacons somewhere in New England. This is the explanation of his political frenzy. He is busy avoiding the inevitable, contracting those conditions of "freedom" which interfere with his own supremacy, and in fitting his ethics to the exigencies of every situation. The integrity of his name and the honor of posterity are thus insured.

But if he is a realist in politics, he is a romanticist in love. His relation to all women is bounded by one definition or another of that term. His social charm depends upon his manifestation of it; and when he ceases to be a lover he is retired to the archives of society, having really ceased to exist in the most delightful sense of being. But by the title, lover, I mean something more and something less than it suggests to the people of the vulgar West, or in the practical North. A lover in the South is every man, not simply the one who is attached to one woman. His is a narrowed vocation. But there is something fine, innocent, chivalric in the Southern man which leaps into a rose of speech, a look of prayer or benediction whenever he comes in contact with women of his own kind. And by "his own kind," I mean a Southern woman with flowers in her hand and a lifelong determination in her heart to be loved. The man may think he is a bishop or the governor-elect, and all may agree with him in this laudable illusion, but somewhere beyond the area of his bishopric, beyond the confines of his political office, on the moonlit summit of his imagination, the angels in heaven know that there is the helmet and sword of a Galahad or a Launcelot.

I have been told that well bred Northern women would resent the fulsome attention we receive from Southern men. I doubt this. They only think so because they do not comprehend the "spirit of the service," nor the happiness of the experience. Not long ago a Northern woman of great social prestige was detained a few days at the hotel in an old Southern town. She had the manners of a Puritan and the frozen face of a queen. In the afternoon she established

herself in lonely grandeur upon the veranda, which reached to the sidewalk. As is the custom in that place, every man who passed, young or old, black or white, lifted his hat. Her indignation changed to amazement as the gallant wayfarers, unmindful of her agitation, continued their quaintly impersonal homage to the sex. At last, with naïve simplicity, she inquired of us within, "How in this world did so many people learn of my arrival?"

"They have not," one replied, "they lift their hats because you are a woman." She was delighted, poor thing, and in five minutes I observed her returning each bow with a smile, which, for rareness, surpassed anything a Southern woman could do. This was shocking, of course, but she did not know that it is not the custom here to return such salutations. During the remainder of her stay she spent as much time as possible on the veranda, and it is needless to add that the sidewalk was crowded. But I did not blame her. I reflected how terrible it must be to live in a region where one might freeze into an unnatural hauteur for the lack of such inexpressive masculine attention.

But even the Southern man has his limitations as a lover. He stands in awe of the intellectual prude, who he imagines must be wooed upon the Socratic plane. He is sincerely sorry for her, and he is willing, but he simply does not know how to approach the blank walls of her citadel. And, therefore, he could not be more awkward at the business if he were halt, dumb and blind. Primarily he is not himself an intellectual being, and there is nothing in his imagination or experience that prepares him for coping with her forlorn condition. In this connection I recall the courage and sacrifice of a brilliant Georgian, who numbers among his acquaintances a venomously virtuous woman from Boston, who has herself been warped by a system of ethics which she failed to digest properly. The pain and bewilderment upon the Colonel's face when he meets this person at a social function is pitiable. He feels that she despises his eloquence, his grace, his traditions and his ancestors; but, because he is a Southern man, he must break a lance against the bleak austerity of her virtue. He longs to soften and redden her face into something sweet and becoming. But after a passage of flowers and arms between them, the limp in his gallantry is even more pitiable. Meanwhile, the unhappy woman really believes that she is protecting herself against the wiles of the devil. She has no imagination. She does not understand that a man can be honest and not be in earnest. He is honest in the knight errant pose he assumes, but it is monstrous and vulgar to suppose that he wishes to marry every woman to whom he feels it his duty to "make love." Doubtless, if the women of the South were in competition with him intellectually, politically, or industrially, they also would feel that hideous thing, male antagonism. As it is, all he asks of his womankind is that they possess beauty, charm and goodness. It is not for me to say that they excel in these particulars; indeed, I have sometimes thought more wit would add a relish to the combination, but I do know that our most strenuous efforts are made in this direction; which, of course, may convict us of weak mindedness in the opinion of some. But we have our reward—we are ridiculous enough to be pleased, because we are the most beloved and the best protected women in this country.

This interpretation of the Southern man is incomplete without some notice of his higher life. He is not ethical, but he is spiritually minded. That is to say, no matter how perverse his ways are, he has a courage of the soul which overlooks the deeds of the body and depends upon God for salvation. Religion is the sincere romance of his soul. There is little material in him for the making of a saint, but no wider field of repentance can be found than he sows and reaps year by year beneath an ever forgiving heaven. Such vices as he has are private, sacred, and he resents their exposure as much as if they were really dear to him. Thus, if one is exploited in the Northern press, he is ready to contend for it as valiantly as if it was the family coat of arms. He is the only man living who fights as gallantly for his faults as he does for his virtues. They also are his offspring, halt, lame and

blind children of his common nature, so near and kin that to deny them would seem to his romantic soul a kind of treason.

I do not believe the Southern man will ever become identical with the Northern type any more than I think the soil in Vermont will grow cotton, and for the same reason. The climate there is too cold, the earth too lean to win a silken bloom. And in the South the air is too mild, too fragrant, and too languorous with dreams to produce a nutmeg Yankee. A man is a man the world over, God help him! But in the South, I think, he is nearer kin to angels and devils than he is in any other region.

Governor Taft's Record in the Philippines

BY JAMES A. LEROY

FORMERLY SECRETARY TO COMMISSIONER DEAN C. WORCESTER

ONE of America's "deans of literature," in an attack of pessimism over our public life of to-day, lamented the passing of "the typical American of the good old days," or something to that effect. This outburst centered chiefly about our undertaking in the Philippines, which seemed to the good man of the pen the head and front of our offending, and both main cause and incident of our decline as a nation. At the very moment of his giving voice to this lament, there was coming to the chief control of affairs in the Philippines a man who represents the very best traditions of American citizenship, who is faithful to the ideals of the "good old days," while fully in touch with all the currents of national life to-day, nor yet less jealous of our honor, nor less solicitous of our welfare for the future. He, too, would have wished that the United States should not involve itself in the holding of territory in the Orient; but that did not prevent him from recognizing that his country had certain duties of the moment to meet nor from loyally engaging all his splendid activities in the effort practically to discharge them. And the reward of his faithfulness to duty will be the credit, if not of having "solved the Philippine question," at least of having started it well on its way to solution, by bringing clearly before his fellow citizens what are the essentials of the situation and by marking out for the Filipinos the lines along which their future political activity will proceed.

WILLIAM H. TAFT

This man, whose success with the Filipinos since 1900 makes us wonder why he was not sent out to them in 1898, is William Howard Taft, now on

Crowd listening to W. H. Taft's inaugural address as Civil Governor, Manila, July 4th, 1901. Picture looks toward Manila Cathedral. Stand is erected on site of old Governor-General's Palace, ruined in earthquake in 1861. The "Ayuntamiento," present seat of Civil Government for the Islands, is directly across the Plaza from this

his way home to become Secretary of War. He went out in 1900, known popularly only in Ohio and the other States of the Sixth Judicial Circuit, tho marked as a coming man among jurists and men more intimate with the public life of the nation; he returns at the beginning of 1904 as a striking national figure. The Philippine career of this American citizen is worthy of reperusal at this time.

The name by which he has always been familiarly known, "Bill" Taft, is still an appropriate name to-day, when the memories of his athletic career at Yale (where he rowed on the 'varsity crew, was champion wrestler and boxer, etc.) belong only to a limited circle. There is a pretty general conviction among us that a man who can carry his nickname into middle-age and into public life is quite worthy of confidence; one can go for precedents into the early days of our national life, when our "shirt sleeves" methods earned us the reputation Europe still gives us of being an undignified nation. And Governor Taft has lost nothing in the esteem of his countrymen for having proved that wholesome, hearty good-fellowship and direct, plain speech have in three years given him such a sort of hold upon a people of the "subtle East" as the wise Oriental specialists do not contemplate in their philosophy.

At the farewell banquet given by the San Francisco Chamber of Commerce, before the Second Philippine Commission, sailed from that port on April 17th, 1900, Judge Taft said frankly in his speech that he had not at first been in favor of retaining our hold on the Philippines, and had come to face it only as a necessity which conditions forced upon us. There was at least the intimation that he was still open-minded as to what the future would bring forth for the Philippines, close-handed rule, a large measure of autonomy or independence. But it passed unnoticed in the general assumption of the time that all these five McKinley appointees were necessarily "imperialists."

The Commission and its then slender staff of assistants disembarked at Manila June 3d, 1900. The succeeding three months were spent in investigating the main subjects of Philippine affairs they were soon to deal with. Judge Taft reserved for himself the friar question, public lands and the civil service, in particular, and was generally alive to every phase of the not simple "Philippine question." On September 1st, according to the instructions of the President of April 7th, 1900, which will stand as a sort of Magna Charta of American-Philippine administration, the Commission began the formal exercise of its functions as a legislature for the islands, General MacArthur for the time being retaining executive control of civil affairs as Military-Governor, besides being commanding general of the army in the Philippines.

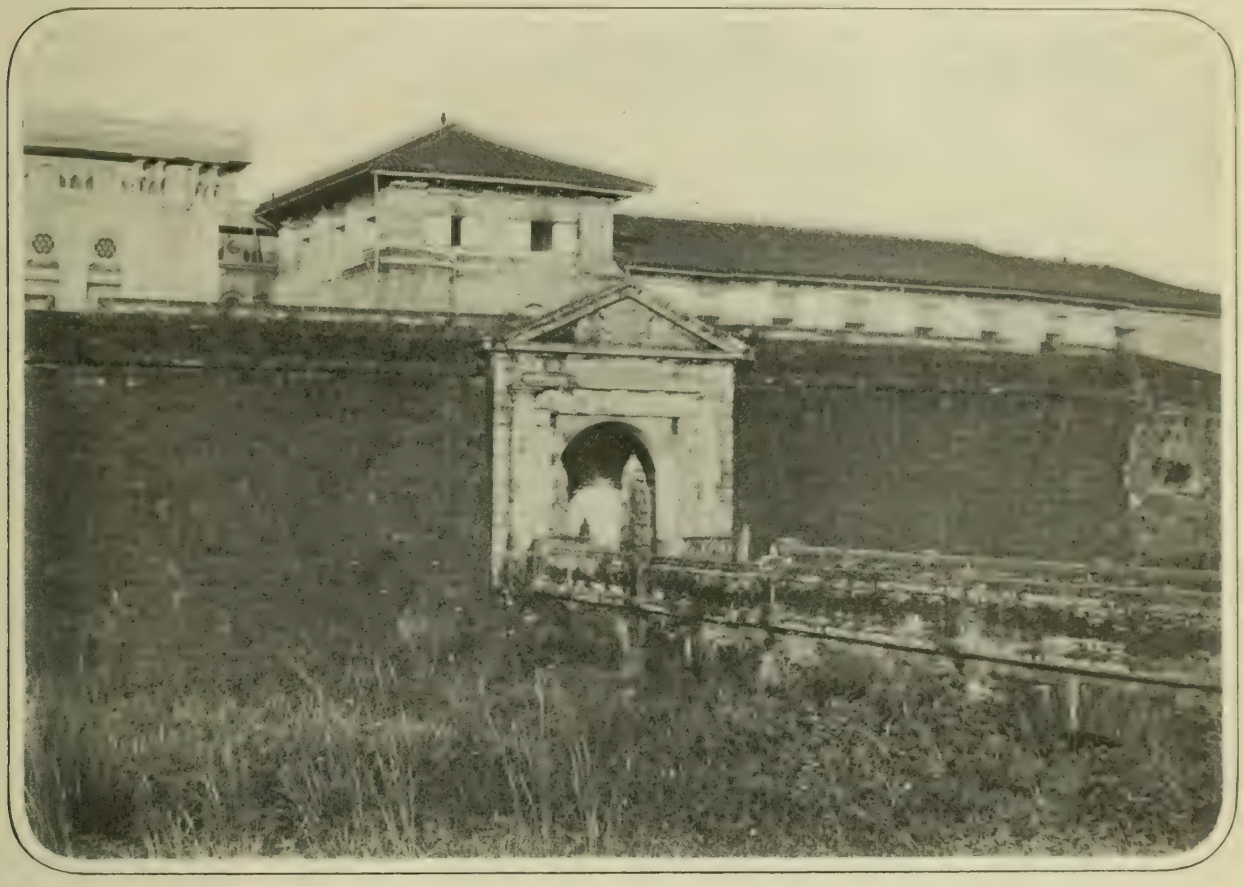
At first, the Commission's duties were most important as controlling the expenditure of the insular revenues, up to then managed by the army administrators under no very well defined system. But the broadest plans for the reorganization of the archipelago on a civil basis were well under way, and shortly after the election of 1900 they began to be put into effect. First, there was the educational act, calling for the expenditures by the central government on primary schools of about $1,400,000 annually, and the hiring of 1,000 graduates of American universities and normal schools as teachers; then, the municipal and provincial government codes, giving the towns of the archipelago nearly the same measure of autonomy that American municipalities have, while for the first time both towns and provinces were freed from semi-ecclesiastical and semi-military rule; meanwhile, the merit system had been inaugurated in the civil service, and, soon after the first provincial governments were under way, a new code of civil procedure was enacted and the courts of the archiplago reorganized and put in very large part into the hands of American judges.

All this work went forward so rapidly, being more or less coincident with the visits made by the Commission to one after another of the provinces of the archipelago, as they were ready to pass from under military rule, that it was a long time before the public at home got

The "Ayuntamiento," or City Hall, of Manila. As the best available structure, this has been occupied by American Military and Civil Government as Headquarters since 1898. Governor Taft's office is in the corner room facing this way; view taken from Cathedral

a clear idea of what was going on in the islands, while it has not yet fully explained to itself what it was that came about in early 1901, which seems so to have given the right-about-face to our relations with the Filipinos, hitherto so unsatisfactory and thereafter so steadily improving.

Probably the average citizen, patching together the odds and ends of what has reached him from the islands, is inclined to believe that the cause of it all has been Taft. And in truth, tho this view does not take fair account of the zealous labors of Mr. Taft's colleagues, of the return of the conservatives to control among the Filipinos, nor of the effect of a more consistent and intelligent military policy, it is not very far from the truth. Absolute straightforwardness, combined with sympathy and tact, whatever may be true of other Orientals, these are the traits of a personality which will acquire prestige among the Filipinos. And affection, too, for no man really has prestige among them who has not gained their affections. Within two months after Taft's arrival in Manila a Spanish newspaper editor had caught the drift and dubbed his future course the "policy of attraction." As the Manila Filipinos came to know Taft, they let their friends in the provinces hear about him. When the Commission went on its tours, organizing civil governments, the provincials in turn came under the charm of a personality which wins even the cold-blooded Anglo-Saxon to what it will with him and which could not less than make of the responsive Filipino a subject. Add to this the fact that he was herald-in-chief of a new civil policy of government calculated to satisfy, either entirely or in a large measure, the aspiration of the intellectually intransigent then holding out against the United States, and one may understand why Taft has become the "idol of the Filipinos" in sober truth. Quite to understand, however, all the subtleties of this sub-surface change in the islands one would need have been at the side of the man himself while it was making; have seen how he pierced straight to the kernel of the problem, and gauged the real needs and desires of the Filipinos, never more clear than in the emphatic way in which he identified himself with them in their cause against the friars; how he drew to himself all the solid elements of the native population, and so gained the respect of the superficials or the scoundrelly that he frequently was the repository of their confidences; how consummately he handled *all* these, playing them and their jealousies off against one another when he could not appeal to their virtues; how he met them in social equality, danced with their ladies, broke bread at their tables, and in a dozen ways gave them opportunities to exhibit themselves at their very best as hosts. These are all, the last as well as the first, elements in the Taft *régime* which the future historian of the Philippines will have to take into account. If "genius is an infinite capacity for taking pains," there are more ways than one in which Governor Taft has it.



He was inaugurated Civil Governor of the Philippines, the first non-military governor the islands had had since the early days of Spanish rule, on July 4th, 1901, while the Commission was yet in the very midst of its organization work. That work was not yet completed when he was taken sick from intestinal troubles, and eventually had to submit to an operation in November, 1901. One understood how Filipino hopes were centered on him when he observed how anxiously every report about the patient was caught up, and what apprehension was created by the Manila-born rumor that he was to be recalled home and replaced by a Military Governor once more. When he finally was starting for home, he took pains to assure the throng of natives who had gathered at the Malacañan Palace to say good-by that he positively would return.

Judge Taft is a very large man, of powerful frame, and has also in recent years become quite stout, so that he really needed to go to a more bracing climate to recuperate fully from the operation. His fellow Commissioners sent Secretary Root a telegram, saying he ought to come home on vacation, and he accepted President Roosevelt's invitation to that effect only when put on the ground of the need for him to lay his work before Congress and advocate the legislation necessary to put things on a more permanent basis in the Philippines.

The "army cruelty" campaign

brought about an extensive ventilation of Philippine affairs in the Senate. Without Governor Taft, however, it is almost certain that the attention of Congress and the country would not have been focused on the real point at that time at issue—viz., should the progress realized toward a peaceful status and an efficient Government be crystallized into permanency, or should things be allowed to drift? Following his appearance before the committees of Congress, even in the midst of one of the fiercest partisan debates of recent times, not a speaker on either side but paused a moment to pay at least some small tribute to the man Taft. And more than that, the public at home had come nearer to the man, had felt a little of the magnetism there is about him, and had been able, in some measure, to realize how he had accomplished what he did in the Philippines. In all fullness and frankness, he had taken his fellow-citizens into his confidence on the dangers and the doubtful points of our "experiment," as well as on its rosier aspects; he had received in return that public confidence in his sincerity and his ability to meet the task in hand which has ever since been manifest in editorial utterances, public speeches and private arguments.

It was a bold stroke which carried Governor Taft to Rome on his way back to the Philippines—conceived and engineered among the President, the Secretary of War and himself. They bid high—a "transaction" was offered which would secure, at one stroke, the elimination of the friars from the islands where they have clung to the seats of unwelcome guests. Success in this would have unified the Filipinos under American rule as nothing else possibly could. But monastic influences were too powerful of the Vatican to permit the making of this "bargain," advantageous tho it was to the Church. The friar land question was postponed for settlement between Taft and Monsignor Guidi, and the Vatican gave the Governor verbal promises as to eliminating the friars as rapidly as circumstances would permit. The orders in Manila had, by exorbitant de-

One of gates of walled city, Manila, looking toward Manila Bay, showing part of the big convent of Augustinian Friars

mands, maintained until very recently a deadlock on the question of Government purchase of their estates. Furthermore, most of the Filipinos believe that the Pope's Bull on the Philippines, published last December, shows that the Vatican had by then gone back on its promises to Taft in regard to the withdrawal of the friars. Meanwhile, there is a new *régime* at Rome, and we must await results when the Philippine policy comes in for its share of attention. (The recent elimination of the land question means much; and the new American bishops may do more, in provinces not affected by the land troubles of the friars.) But even more important than that, as affecting this old and vital issue in the Philippines, the Filipinos at large are beginning to get some inkling of what religious liberty really means, and the friar question is losing importance day by day. How much it has meant since his return to the islands in August, 1902, that Governor Taft held the absolute confidence of Filipinos of all classes, and how large a part he has had in steering the Church schism into peaceful channels, as a legitimate movement against the friars, and the first such movement not resultant in disorder, it is difficult to appreciate. There were some indications that toward the close of the negotiations he grew indifferent as to whether the Vatican and the orders came to an agreement with the Philippine Government or not; that he now believes that the friar question is not so full of dynamite as it once was, but may perhaps be left to the people to work out by going their own way in Church matters. At any rate, it is just now of much greater concern to the authorities at Rome than to the American Government that there are upward of 3,000,000 schismatics under Aglipay's banner, with minor revolts from Rome under way.

The picture of the personality of Taft would be entirely incomplete for those who do not know the man himself without the light thrown upon it by his refusal twice of a place on the bench of the United States Supreme Court. He has stated that this was his dearest ambition. He was altogether a probable candidate even before President McKinley asked him to leave his quiet and, for him, chosen career on the bench of the Sixth Circuit to go to the then turbulent Philippines. When he accepted the reporters either guessed, or were informed, that he would be given the first opportunity to take a place in the Supreme Court. At any rate, President Roosevelt has since regarded this as a promise of his predecessor which he was bound to respect. When he first offered Taft a place where his ambition has been to sit the latter promptly declined on the ground that he "believed he was needed in the Philippines" and he had promised their people he would come back. Again, a year ago, there came another vacancy, and Governor Taft, but a few months since back in the harness at Manila, after a reception unparalleled in that city's history, again replied that he felt that he ought to stay by the work he had on hand. The invitation was repeated, more as a request; this time it was not refused, less because Governor Taft yielded to his real longing for a place on the Supreme Bench than because he felt he had, like the soldier, to say "I am at your command," and because he was too modest to urge a second time his own importance in the islands. But the people themselves took it in hand and did that for him. They deluged the President with cable messages, all parties, all classes, even all nationalities, until he said to Taft, "Stay, if you wish." It was a demonstration worthy of record in all colonial history. And the object of it turned aside for the second time from his cherished ambition, and plunged again into the multifarious details of his duty, this time as the plainly elected guardian and protector of an alien people, in a climate which expert physicians had said to him he should avoid,

Those details it needs one experienced in the Philippines to appreciate, if recited in their bareness. Suffice it to say that at the end of 1903 Governor Taft himself evidently does not feel that his presence is so necessary as it was; more significant, the people themselves seem to feel somewhat in this way about it, and have acquiesced in his return to Washington, partly because they may think another protest would be out of place, partly because they see the greater firm-

ness of the structure which Taft has been rearing. And this time he returns home to a post where he will retain his control over Philippine affairs. We may believe that no effort will be spared in the islands to let the people feel that his hand is still guiding their affairs.

Some approximation to a likeness of the man William H. Taft may have appeared in this recital of his deeds. Not all, however. Part of him is revealed in his hand-clasp, in what the Filipino press calls that "characteristic smile" which so frequently sweeps over his face and bespeaks geniality and good-will for all humanity. More than the jurist, the statesman identified with the Filipino problem, or an official who still stands before the public as distinctly a figure of the future, he is the whole-souled, full-hearted, all-around man Taft, clear-brained and clean-handed. Paraphrasing one of our State mottoes, if you seek an American of the "good old days," look around you.

DURANGO, MEXICO.

The Condemnation of Loisy

BY PRESBYTER

["Presbyter" is a Roman Catholic scholar and cleric of distinction. Of the Abbé Loisy's works, "The Gospel and the Church" was issued in an English translation last year by Christopher Howe (Islister & Co., London, 1903). Loisy's "*Autour d'un Petit Livre*" and "*Le Quatrième Evangile*" are published by Picard, Paris.—EDITOR.]

THE two opening treatises of Catholic Dogmatics, "*De Revelatione*" and "*De Ecclesia,*" cut the ground from beneath Scholasticism. Scholasticism calls for a universal Major, for the most part a revealed truth, whence by means of a handy Minor a conclusion is found. In other words, Scholasticism follows the deductive method. But revelation and the Church stood outside the old Scholastic disputes, were accepted facts, and figured nowhere but as undoubted Majors. In the sixteenth century the questions raised by the Reformers struck at the Church; those of the French Encyclopedists and English Deists of the eighteenth were aimed at Revelation. Thereupon Scholasticism and the syllogism were seen to be helpless. Thus Induction got a hearing and had to be depended upon in order to put Revelation and the Church on some sure foothold. Along the lines of Induction stand forth in our day the writings of Abbé Loisy, specially in his work, "The Gospel and the Church." There the learned Frenchman rears the Christian system by inductive processes and argues "solely according to the data of history" (p. 3). He wrote therefore as an historian, not as a theologian. This, however, did not save this work and two others of his from being denounced at Rome and there condemned. Not only are these works condemned, but their author was denounced to the Holy Office. Three hundred years ago this would have meant for Loisy the fate of Galileo or that of Gordiano Bruno. To-day it will fall flat.

Let us look first at the writer and then at the three books under the ban. The Abbé Loisy is still young, probably in the forties. He got his taste for Scripture studies, we believe, at Strasburg under Holtzmann, the well-known professor of New Testament Exegesis. While lecturing in the Catholic Institute of Paris he fell foul of the Church authorities of the French capital and was thrown upon the street in spite of the protests and friendship of the Rector, Monsignor D'Hulst, who died shortly after, it is said of a broken heart. Loisy was now reduced to beggary. His own people passed him by with averted faces and closed pockets. Salary he had lost and with it support. The favorite weapons of Clericalism in all ages and lands—calumny and ridicule—were let loose upon his devoted head. But who worried about the good man's bread and butter? The Protestant Berger, whose history of the Latin Vulgate is now a

classic, turned over to the forlorn Catholic priest a course of lectures at the Sorbonne which netted four hundred francs a year [$80—about]. With great courage Loisy joined a few other scholars in starting "*Revue D'Histoire et de Litterature Religieuses.*" This is a very learned magazine, thoroughly abreast of modern scholarship. We regret to add that it counts hardly more than a baker's dozen subscribers among the ten thousand Catholic priests in the United States. In it appeared most of Loisy's writings; those on the Old Testament we pass by, also the work on Synoptics. At present he is bringing out a commentary on the Second Gospel. Of the three condemned books, only one—the Fourth Gospel—appeared in the *Revue.* "The Church and the Gospel" is about a year old. At once on its coming out—January 1903—Cardinal Richard proclaimed it, because it had not his *Imprimatur,* and also because it might "seriously trouble the faith of Catholics in certain fundamental truths of their religion—in particular, the authority of scripture and tradition, the Divinity of Jesus Christ and his infallible knowledge, the redemption wrought by his death, his resurrection, the Eucharist and the divine institution of the Papacy and the Episcopate."

While less than one-tenth—eight out of eighty-four—of the French episcopate condemned the book, still it was denounced at Rome. There the decree of condemnation was actually drawn up, but Leo XIII refused to sign it and died leaving it blank. Perhaps the dead Pontiff remembered how he had been fooled into signing the document which declared the *three witnesses* of First John authentic. It is an open secret that when that decree came out Cardinal Vaughan hurried off to Rome and saw the Pope. On learning how the scholarly world, as well as the early Fathers, rejected the text as spurious, Leo XIII declared that Mazella, the Jesuit Cardinal, had deceived him by saying the disputed text was in the Fathers. Leo XIII would not have his fingers burned a second time.

"The Gospel and the Church" is, indeed, an answer to Harnack, but it is much more. Loisy attempts to lead up Catholicism into line with the achieved results of biblical study and criticism. For this his theory of development leaves room without touching the faith of the Church. After De Lammenais, Loisy makes humanity itself the basis of Catholicism, not perhaps without some influence from Comte and Hegel. As mankind grows and develops, and in so doing sloughs off its dead weight, so the Church grows and develops and drops its drawbacks. Or, to use another figure, the scaffolding which upholds Christianity needs to be adapted to the Zeit-Geist.

"It is just the idea of development which is now needed, not to be created all at once, but established from a better knowledge of the past. The acquisition of this new dogma will have no different effect to that of the old ones. These latter were not contained in primitive tradition, like a conclusion in the premises of a syllogism, but as a germ in a seed, a real and living element, which must become transformed as it grows and be determined by discussion before its crystallization into a solemn formula. They existed as more or less conscious facts or beliefs before they were the subject of learned speculations or of official judgments. The Christological dogma was, before everything, the expression of what Jesus represented from the beginning to Christian consciousness; the dogma of grace was the expression of the divine work accomplished in the souls that were regenerated through the Gospel; the ecclesiological dogma was the expression of the permanent position of the Episcopate and the Pope in the Church. . . . The efforts of a healthy theology should be directed to a solution of the difficulty, presented by the unquestionable authority faith demands for dogma, and the variability, the relativity, the critic cannot fail to perceive in the history of dogmas and dogmatic formulas" (pp. 214; 215).

When Cardinal Richard denounced "The Gospel and the Church," the Abbé Loisy held up the second, enlarged edition. Now this is out, and from it is made the English translation from which we have quoted. Once again clerical calumny and ridicule found full vent. At last Loisy broke silence. The "*Autour d'un Petit Livre*" is a fresh picture of another Gethsemane. The man of sorrows is the portrait drawn. Therein he pictures how for fifteen or twenty years he has applied himself to the study of Biblical Exegesis. His disinterested labors are tracked "*comme bêtes danger-*

euses." For a dozen of years he has struggled on without help from those who had some grounds (*quleque raison*) to help him. "Is there—he asks—under the pectoral cross the heart of a father and under the golden miter the mind of a master?"

With some honorable exceptions, especially Archbishop Mignon of Albi, who went to Rome in defense of Loisy and brought him thitherward, the French Episcopate showed stony hearts and wooden heads. We expected better things of the Monseigneurs, particularly so of Le Camus of La Rochelle, who before wearing the miter outstripped Loisy. It is queer how often the forked hat serves also as colored spectacles to its wearer. The bishop sees quite otherwise than the priest.

"The Fourth Gospel," the last of the condemned books, labors to prove that John's Gospel is rather a treatise on the Incarnation than a life of Christ. The sermons, the dialogs, the miracles, the resurrection of Lazarus serve rather to explain the thesis of the Divine than to offer historical data. This view is not original with Loisy; it is quite a common opinion among scholars of our time, altho, probably, Loisy is the first Catholic to commit himself to it.

Let us conclude with an extract from a notice of the second book in the Hibbert Journal [January, 1904] and signed "*Romanus:*"

"The truth appears to be that the facts on which theology rests are, in themselves, indifferent to this or that theology; they may be made to support any or none. For faith and science differ in content as in origin. Their relationship to one another is negative; it is enough—but it is essential—that there shall be no contradiction between the two. M. Loisy has done for Catholicism what Harnack has done for that *Wesen des Christentums* which is common to Protestanism and Catholicism. He has done it with singular ability, with singular sincerity, and with singular success. He is the one writer of our time who has stated the Catholic position scientifically, showing its sufficient reason in history and in the human mind. From this point of view his writngs are of first importance; no criticism of Catholicism can be taken seriously which leaves them out of account. Whether they commend themselves to the authorities or the average opinion of his Church is a matter of small importance. Ultimate acceptance, not immediate popularity, is the test of truth" (p. 389).

If not mistaken, we fancy that "*Romanus*" is the Catholic layman who writes so well in the *Contemporary Review* under the pseudonym "*Voces Catholicæ.*" Well he says "ultimate acceptance." Rome repudiates Loisy. But if the distinguished French scholar followed his name with S. J. immediate acceptance would be pretty sure to follow, and Loisy might get the Red Hat, instead of the ban.

Within twenty years manuals of Catholic apologetics, notably by Jesuit authors, will appear, in which all of Loisy's positions will be held; based, too, upon his arguments. At the end of many propositions, however, will be a lot of objections, which will be made up of the now condemned propositions. They will run somewhat like this: The Abbé Loisy says so and so—a condemned proposition will follow. But under Pius X this was condemned. Therefore Loisy is wrong and his opinion must be rejected "*uti erronea, falsa, hæresi sapiens, piarum aurium offensiva, hæretica.*"

Yes, Loisy is cast out, but Loisyana will be accepted. For Loisy's ideas are those of the Zeit-Geist, which are common to thoughtful men. In fact, in many places Loisy acknowledges his indebtedness to Newman. Again, the great English Cardinal is regarded by Wilfred Ward, a devout Catholic ('Problems and Persons'), and with him coupling Sabatier and Harnack, as having "had already anticipted the deeper suggestions of these writers, supplemented them by a more accurate historical survey and pointed out their bearing on Catholic thought in a work ('Development of Christian Doctrine'), the full significance of which his contemporaries were not in a position to understand" (p. 51). Sabatier and Harnack, Newman and Loisy; two Protestants and two Catholics. Two are gone to their rest but live on in their works. Loisy and Harnack remain, let us hope, to heal by the unifying strength of the evolution of thought the unhappy breach which divides and distresses Christendom.

Rizpah

BY E. TALLMADGE ROOT

Why should my Lord, the King, inquire the name
Of such a dead dog? such a worthless flea?
Thy servant is a man of Gibeon.
Placed by my brethren here on guard. For when
Jehovah sent long famine on the land,
Because Saul's bloody house kept not the oath
Which Joshua to our wily fathers swore,
My Lord himself gave up seven sons of Saul,
And them we hanged before the face of God.
Then, to thy servant, said the Gibeonites:
"Watch thou, lest any pluck these bodies down."
Let not my Lord in wrath say: "None would touch
"The hated of Jehovah and the King!"—
For one did dare show kindness.
When I saw,—
Just as the first long day grew dark with night,—
That figure robed in sackcloth, quick I ran,
Stood in the path, and cried: "Back, on thy life!"
Then, lo! a woman's sob shook the strange form;
And as the parting cloud shows white and gold,
The swaying sackcloth to mine eyes disclosed
Fine linen and such gems as queens may wear.
"Wilt thou forbid me to approach my sons?"
"Daughter of Aiah," I exclaimed, "for thee
"This grim sight were not fit! To gaze on flowers
"Thine eyes were made; thy limbs, for damask couch.
"True, dead is Saul; and princely Abner, dead;
"But men there are who live—" I stopped, amazed.
So have I seen the lioness, at bay,
Glare, while she screened her whelps.
"Fool! let me pass!
"Two, yonder, are my boys!"
"Woman," said I,
"If one be taken, my corpse hangs for his."
"Now as Jehovah liveth," burst she forth;
"I swear that I will loose nor thong nor nail!
"I will but drive away the beasts by night,
"And birds of air by day, from their dear forms.
"Then, if I break my oath, strike thou me dead."
My Lord, what could I do? I let her pass;
For in my heart I thought: "Within an hour,
"From the first wolf that howls, back will she flee!"
O, King, see'st thou these big and welcome drops?
The rains for which this bloody offering prayed,
The autumn rains, are near. 'Twas harvest then,
First days of barley harvest, when they died.
See, still she keeps her vigils!
Stout my heart,
King David, tho ye call "hewer of wood
"And drawer of water" still; and I have seen
Thy lion-hearted men of Judah fight.
But never have I known courage like this!
No man of all mankind but what had fled,
Long moons ago, from yon accursed spot!
Fled from the grim realities of day,
And from the half-heard horrors of the night,
Lest sounds and sights and smells had set him mad!
But Rizpah spread her sackcloth on the rock,
And bared her dainty arms to sun and wind.
And with her slender wrists beat back brute might;
Till angry eagles quailed before her eye,
And lions fled rage fiercer than their own,
The fierceness of a human mother's love!
My Lord, Saul would not know the girl he made
The pretty plaything of his idle hours;
Nor Abner recognize the face for which
His soul turned traitor to his master's house.
Gaunt, haggard, withered, browned, unkempt and foul—
She that once matched the glowing, fragrant rose!
Yet to my mind, she seems more glorious,
Thus stripped of every grace that woman loves,
In the sheer grandeur of her motherhood.
Wo, wo is me! that I have spoken thus,
Who am but dust and ashes, to the King!
What saith my Lord? Have mine ears heard aright?—
Ho! Rizpah, ho! Thy vigils have an end!
Yet shall thy sons lie with the great of earth
Where troublers cease and where the weary rest!
For one hath told King David of thy deed;
And lo! he comes to give fit burial
To all the house of Saul.—Now weep, poor eyes!
Hands tense and torn, unclench! Relax, brave heart!
E'en hate and hell yield to a mother's love!

PROVIDENCE, R. I.

The Proposed Navy General Staff

BY PARK BENJAMIN

[The statements made in this article may be depended upon as coming from the best authority —EDITOR.]

IT is proposed that the civil power of the Secretary of the Navy shall be made more effective, in order that he may be better able to comply with the law which requires him to recommend to Congress an adequate naval force, and which holds him responsible for its provision, distribution and maintenance. It is further proposed to do this by creating by law a General Staff. The need originates in the natural outcome of a condition which has long been developing and which is now rapidly becoming acute. This is because of the recent extraordinary progress in the art of naval warfare and in every form of naval material.

The magnitude of the civil authority is ample. The units which make up the great military weapon which it must wield are of the best. But between power and weapon something is missing which prevents the latter being used to its effective capacity and which renders the control of it imperfect. As a consequence, the Navy to-day is being administered through expedients. Its individual units are working splendidly; but under a strain which cannot indefinitely be borne. Relaxation must come, and already there are signs of it. A dozen strong men hauling on a rope may lift and hold up a heavy weight. But sooner or later human muscles must tire and yield and then the weight will go down. We want something like a handy belaying pin on which to catch a turn of the rope and so permanently hold the load. We have not got it.

That is the imminent situation. The General Staff proposal is therefore not merely an appeal to Congress to recognize and provide for an urgent need, but a warning to the country of an impending peril.

The actual conditions are as follows: The Secretary of the Navy being a civilian, untrained in the military profession, and sometimes, on taking office, wholly ignorant of naval matters, must, of necessity, rely upon the knowledge of others, and be guided by their advice. This counsel, it might justly be assumed, is provided for him by law and permanently installed in his Department. Such is not the case. The law simply commands him to divide the "business" of the Navy Department among eight bureaus —and these are nothing but purveyors of men and material. To each bureau is assigned the provision of certain naval elements. The Bureau of Navigation finds and qualifies men, and the Bureau of Medicine conserves their health; the Bureau of Construction provides ships, the Bureau of Ordnance arms them; the Bureau of Engineering contributes their engines and boilers, the Bureau of Equipment gives them coal and all their multifarious furnishings; the Bureau of Yards and Docks maintains the places where they are refitted and sometimes built, and the Bureau of Supplies is the fiscal agent which, as directed, buys and pays.

Each Bureau Chief is supreme in his own department. Each receives and disburses great sums of money. Each finds in the performance of his own specific work enough, and sometimes more than enough, to exhaust his energies. No Bureau Chief has time now for duties outside of his immediate field —and as, in every branch of naval material, complexity is increasing, it is plain that to impose upon him new burdens is merely to invite him to neglect old ones fully as important. The Bureaus being independent of one another, the chiefs speak with equal and often conflicting authority. Each jealously maintains his own *imperium in imperio*. His tendency is always to consider all questions from the point of view of his own functions, to magnify the relative importance of his domain, and generally to take positions very much akin to those

assumed by the individual States prior to the adoption of the Constitution.

In brief, there is no co-ordination of the Bureaus save by voluntary action of the chiefs, short of the Secretary himself. And thus he, altho really a layman seeking counsel and help, finds himself forced into the position of an arbiter and, before he can decide how to act, called upon to pretermit his administrative duties in order to judge between the opinions of disputing experts.

It is only necessary to recall the recent wrangles over double turrets, and inclined armor, and submarine boats, and 7-inch guns, and submerged torpedo tubes, and battleship tonnage which have attended the effort to construct a Cabinet out of the Bureau Chiefs, to show the futility of diverting them from their proper employments. Nor can any redistribution of business help matters, nor give to any Bureau the right to control the others; and of course, no new Bureau can be created save by legislative act. Individual power and individual responsibility, both valuable in themselves, the Bureaus possess; but nothing co-ordinates them to a common end, nothing fixes the responsibility under the Secretary for the general efficiency of the fleet and its preparedness for war.

A homely illustration readily suggests itself. Any one desiring to build him a house, takes order as to its cost limit, and determines generally upon what he wants. Carpenters, masons, stone cutters, decorators, plumbers are all at hand and of high competency. Yet our house builder does not call them in advisory congress. If he did the carpenter might well advocate an edifice of wood, and the mason, with equal force, one of brick; the stone cutter would extol the merits of an ornamental façade, and the decorator the comforts of an elegant interior, and so the immutable laws of "business" would set every purveyor to purvey his utmost and always to capture for himself the biggest share of the building appropriation.

Wherefore our builder consults an architect—and then order reigns. On the ne hand, he is advised as to his outlay and the best results obtainable in accordance with his desire—on the other, the artisans are co-ordinated to best produce these best results. The Secretary of the Navy is our house owner and the Bureaus are the purveyors; but there is no one in the Navy organization to correspond to the architect. His functions are the functions of the General Staff; and just exactly as the architect enhances the power of his employer to obtain the desired house, so the General Staff enhances the power of the Secretary to obtain, provide for and manage the fleet.

It has been stated that the Navy is now getting along—tho under perilous strain—with expedients. By that is meant that some of the special functions—tho by no means all—which a General Staff would perform, are done by existing officials or committees. The Office of Intelligence, which gathers information regarding foreign navies and controls the naval attachés, contributes certain data—and the War College, where questions of strategy and tactics largely academic are discussed, takes up living issues in the same field. The heads of these institutions together with the Chief of the Bureau of Navigation (who details all the officers, enlists all the men, disburses over a million dollars a year and distributes all the ships), the Admiral of the Navy and a few other officers form a so-called General Board—a body unknown to the law, created by one Secretary and capable of abolition by any other. This to a limited extent sends advice upward to the Department. But it is powerless to send directions downward to the Bureaus or to see to it that they execute its plans after the Secretary has approved them. It has been a good makeshift so far as it has been able to go; but the distance has necessarily been very short.

The name "General Staff" has proved somewhat delusive and seems to have evoked many singular ideas from apprehensive people. It does not imply a coterie of favored marine warriors moored permanently at Washington and ready at a moment's notice to fill any "soft billet" which may present itself, or to grab the center of the stage in event of war, any more than it connotes the band of gilded citizens which trails behind the prancing Governor and falls from unaccustomed steeds. Nor does it involve new vice-admirals, nor rear-

admirals additional or otherwise, nor multifarious committees, nor the climbing of any living soul into office particularly choice and sinecure. Simply for purposes of family discussion within the Navy probably half a dozen detailed plans have at different times been privately suggested, and these have served the useful purpose of clarifying ideas and drawing the fire of chronic objectors to any naval progress at all; but, as a matter of fact, no plan whatever has been or now is officially advocated by anybody. It is simply asked of Congress that it will consider and in its wisdom meet the need. The advocates of a General Staff will be equally well satisfied whether the idea be embodied in one individual or in a plurality; whether in a new group of officials or in one already existing. They will submit carefully considered details if desired, or advice on any plans, or give any information they possess, as Congress may see fit to order.

Of course it will be asked how the Navy managed to get through two wars by the aid only of the Bureau system and without a General Staff. It did not. Providence during the Civil War raised up Gustavus V. Fox—officially Assistant Secretary of the Navy. He was a successful business man and had been a naval officer. He knew the Navy and it knew him. He assumed about all of the functions of a General Staff and some others—even to the extent of going down to the blockade and taking command when the spirit moved him. The Bureaus followed far in his wake. When the Spanish War broke out did we not immediately become panicky and evolve the "Strategy Board" as a direct substitute for a General Staff?

The object and purpose of the Navy General Staff—however it be made incarnate—is to present to the Secretary the needs of the service, as a whole; to maintain a definite, coherent and continued policy—for permanency is most essential—and to co-ordinate the work of the several Bureaus in all that affects the efficiency and conduct of the fleet as a military organization—this always under the direction of the Secretary of the Navy.

More specifically still, it has been suggested that the General Staff may advise the Secretary and determine subject to his approval:

1. The number and types of ships proper to constitute the fleet, the number and ranks of officers and the number and ratings of enlisted men required to man them—and the yearly increase necessary. This implies prescription of the speed, coal endurance, armament, displacement and draft of every class of vessel.

2. The location and dimensions of dry docks and the location and capacity of coal dépôts and the provisions for defending them.

3. The reserves of ordnance and ammunition needed to meet the demands of the fleet in war—and where supply dépôts shall be established.

4. The distribution of the fleet on home and foreign stations and reinforcements thereof; the supervision of the naval militia, all reserve and auxiliary forces in active service, and the determination of the supplies of war, ammunition, provisions and stores of every sort to the fleet and of the places and times for their delivery.

5. The preparation of plans of defense and campaign and of co-operation with the army.

6. General policy.

In none of these particulars will the General Staff encroach on the prerogatives of the Secretary on the one hand, or on those of the Bureaus on the other. It will not, as has been thoughtfully remarked, convert the Secretary into a "figure head" or the Bureau Chiefs into "tradespeople." It will augment and secure the ascendency of the civil power over the military power, and do this by the instrumentality of the military power itself.

A General Staff has just been successfully established in the Army. Similar provision for the Navy has the approval of the President, the Secretary of the Navy, Admiral Dewey, the military Bureau Chiefs and nearly all the naval officers. No project for the betterment of the Navy has been proposed which more fully deserves the cordial support of the people.

Mr. Moulton on Shakespeare Again*

BY HENRY A. BEERS, M.A.

PROFESSOR OF ENGLISH LITERATURE AT YALE UNIVERSITY

MR. MOULTON'S "Shakespeare as a Dramatic Artist," originally published in 1885, was a very stimulating piece of criticism. True, it seemed to many readers that the author carried his system of plot analysis by graphical illustration to a mechanical extreme. Literature is not geometry. The same feature is repeated in this new volume. Diagrams in the appendix depict rising and falling action, subactions "link circumstances," and the like. The shifting relations of the two pairs of lovers in "A Midsummer Night's Dream" are made plain to the eye by a series of parallelograms and triangles.

Still, all this is ingenious and, up to a certain point, useful. But one of Mr. Moulton's main contentions appeared to many others quite inadmissible. This was his claim to have invented, or expounded, a method of scientific, inductive criticism, workable by anybody, and attaining demonstrable truths with the sureness of a mathematical formula. But there is no such *organon* or instrument in literary criticism. You cannot criticise plays and poems by the book of arithmetic. Everything depends on the man who works the "method." A man as clever as its designer, gifted with his sympathetic insight and powers of reflection, will get valuable results with it. But some of his disciples, who have tried to apply the system, have reached conclusions sometimes trivial and sometimes misleading.

If this second book of Mr. Moulton's has not quite the freshness of the first, that is perhaps because we have grown familiar with his point of view, and now and then a little distrustful of the importance of his analyses. The point of view itself is often rather arbitrarily selected, as where "Henry VIII" is made to illustrate the antithesis of the outer and inner life—in other words, Browning's "apparent failure." It requires a sturdy ingenuity to read this into one of the "root ideas" of Shakespeare's moral system, or to prove that it constitutes the leading theme of "Henry VIII" in any greater degree than it does of a dozen of his other plays.

The besetting vice of Shakespearean criticism is over-subtlety. Mr. Moulton, in his search for a deeper or a more novel principle of interpretation, is always eluding the obvious. And yet the obvious is apt to be the true. Thus the time-honored comment on the three Roman plays is that "Coriolanus" represents a conflict of parties—Patrician *vs.* plebeian; "Julius Cæsar," a conflict of principles—republic *vs.* empire; and "Anthony and Cleopatra," a conflict of persons—Anthony *vs.* Octavius. But Mr. Moulton considers more curiously. He considers that this Roman trilogy represents the conflict between the old classical idea of the State and the claims of the individual, and that it exhibits the progressive development of the latter. If it be objected that Shakespeare was not historically in a position to understand the contradiction between the ancient and modern ideas of the relation of the individual to the State, the answer is easy: Shakespeare builded better than he knew. Shakespeare, it has been frequently pointed out, anticipated Hegel, Darwin and other thinkers. But this view of the Roman plays leads the author to the startling discovery that Coriolanus was not proud:

> "Hence the injustice of the common interpretation, which in this drama sees pride and its fall. . . . If we force ourselves to do justice to this hero, we must acquit him of the charge of pride."

He is actuated, it seems, by the purest devotion to principle, to the ideal of the State as opposed to the claims of the individual, represented by the plebs. As a proof that Coriolanus is not proud, Mr. Moulton cites his impatience under praise

* THE MORAL SYSTEM OF SHAKESPEARE. *By Richard G. Moulton.* New York: 1903, Macmillan.

and his unwillingness to show his wounds. But this is to lose sight of the distinction between pride and vanity.

Again, Coriolanus is not proud, since he is willing to serve under others, and is not personally ambitious—is not an office seeker. On the contrary, it is a high evidence of pride that he submits to take orders from the consuls, his official superiors, in the full and calm assurance of his own supreme military genius, knowing that where the MacGregor sits is the head of the table. Let it be granted that Coriolanus's pride is a noble pride, without taint of vanity or self-seeking. Still it is pride—a proud consciousness of worth; and, above all, it is the patrician pride, pride of rank, birth, caste, loyalty to the senatorial order. Coriolanus is a Tory. It will not do to explain his unwavering contempt for the people—

"Yon common cry of curs whose breath I hate
As the reek of the rotten fens"—

as due, not to aristocratic haughtiness, but to a "whole-souled devotion to principle."

This view compels the critic to regard the other patricians, even Volumnia, as trucklers and temporizers, infected with the spirit of compromise. If we understand Shakespeare's meaning in Menenius Agrippa, the humorous old patrician was a wiser man than his friend. His principles were equally senatorial, but his human sympathies were broader than those of the rigid, narrow and insolent soldier whom he idolized. With aristocratic politics he joined democratic manners. His skill in joke and anecdote (Coriolanus had no more humor than Charles Sumner or Salmon P. Chase) endeared him to the people like Abraham Lincoln, whose favorite poem asks "Why should the spirit of mortal be *proud,*" and who said that "God must have loved the plain people—he made so many of them."

Mr. Moulton is hard put to it to reconcile his theory of the hero's character with his action in returning against Rome at the head of a Volscian army. Was not this angry pride, hurt pride smarting for revenge? The word revenge is used by Coriolanus himself; but "this may be called revenge," comments the expositor, "but it is no less service"—*i.e.*, service to his new masters, the Volscians. Here we may ask what compelled him, then, to take service with the Volscians? Was it pure devotion to principle, or was it injured pride?

But, indeed, it is unnecessary to go any further than Plutarch, Shakespeare's authority, for the interpretation of this character, and Plutarch says of Caius Martius, "for lack of education he was so choleric and impatient that he would yield to no living creature; which made him churlish, uncivil and altogether unfit for any man's conversation." Oh, Coriolanus was proud, all right.

We have dwelt somewhat tediously on this point since it illustrates Mr. Moulton's tendency to run into paradox, from his desire to get deeper below the surface, or from his habit of choosing an original point of view and twisting everything into conformity with that. Anyway a paradox is better than a commonplace. It sets us thinking, even tho we dissent from it.

Any one can *fantasiren* upon Shakespeare if he will only let himself go. Did Portia mean to give Bassanio a hint in the song,

"Tell me where is fancy bred"?

Is "The Tempest" an allegory, and does Ariel personify the air? And if so, do his groans, when prisoned in the cloven pine, represent the sound of the wind in a cranny? Lowell and Dowden and Fanny Kemble have all allegorized "The Tempest" in different ways. It is a fascinating occupation.

Let us try our hand at this sort of thing for the nonce, and by way of showing what can be done with the "method."

It will be remembered that Lear says in his dying speech: "And my poor fool is hanged." Sir Joshua Reynolds and others thought that he meant literally the fool, and that either we are thereby indirectly given to understand that the fool had been hanged, or else that Lear, in the wanderings of his mind, confuses his fate with Cordelia's. But most of the commentators agree that "my poor fool" is a term of endearment and is meant for Cordelia. How can this ambiguity subtly apprize us that the fool *is* Cordelia? Notice that they are never on the

stage together. The Fool does not appear until after Cordelia has gone to France.

"*Lear:* But where's my fool? I have not seen him this two days.

"*Knight:* Since my young lady's going into France, sir, the fool hath much pined away." **(I, iv.)**

And he disappears (III, vi) before Cordelia's return. Both parts could therefore have been played by a single actor, and very probably were at a time when women's parts were taken by boys. Let me not be misunderstood when I affirm that, in a sense, Cordelia has never gone away at all. She has only disguised herself in the motley, sticks close to her father and "labors to out-jest his heart-struck injuries." Then the jester vanishes and the daughter reappears in her own person as a comforter; and this double personality is subtly suggested in the King's words: "And my poor fool is hanged." Is this any more nonsensical than a dozen other Shakespeare "interpretations": *e.g.*, that Prospero is James I?

New Haven, Conn.

The Plaint of Psyche

BY LILIAN MULDOWNEY

The way is long, and I am very weary,
The grove is dark, and I am sore afraid;
The olive boughs, in cadence low and eery,
With dismal harmonies the night pervade;
Unholy forms are lurking in the shade,
Their brows awry with menacing grimaces;
The timid starlight, shivering through the glade,
Betrays in mocking leer the hideous satyr faces.

Love, cruel Love, that fleetest at a breath,—
Soul, weary soul, that lovest Love till death,—
Heaven, pitying heaven, that hears the cry of sorrow,
Forgive, sweet Love, and ease, O heaven, the burden of the soul's to-morrow.

O'er weary leagues of wandering have I sought thee,
With drooping heart, through many a joyless day;
Tho dire the wrong of black distrust I wrought thee.
Hath grief no charm to wash the stain away?
A slave beneath remorse's withering sway,
Forever shall the iron scepter daunt me?
Shall sad repentance ever vainly pray
A single look benign from eyes that ever haunt me?

Love, cruel Love, that fleetest at a breath,—
Soul, weary soul, that lovest Love till death,—
Heaven, pitying heaven, that hears the cry of sorrow,
Forgive, sweet Love, and ease, O heaven, the burden of the soul's to-morrow.

The romping sprites of glad Arcadia's fountains
Forsook the dance to bathe my bleeding feet;
The brooding nymphs of dark Thessalia's mountains
Distilled for me the grape's ambrosia sweet;
Of all his fair dominion, is it meet
That Love alone forswear his name immortal?
Forever, lord, wilt thou disdain to greet
The crushed and humbled spirit lying suppliant at thy portal?

Love, cruel Love, that fleetest at a breath,—
Soul, weary soul, that lovest Love till death,—
Heaven, pitying heaven, that hears the cry of sorrow,
Forgive, sweet Love, and ease, O heaven, the burden of the soul's to-morrow.

Boston, Mass.

Literature

Rome and the Renaissance

THE present work * is something more than the story of the Italian Renaissance in art—architecture, sculpture and painting—at its finest, or, at least, most interesting period and upon its most appropriate stage; it is also a powerful psychological study, in which politics, morals and religion play their respective parts as well as art. Only those who have some degree of historic culture can form any conception of the author's marvelous knowledge of this strange epoch, or of the immense amount of research and erudition he has brought to his task. The work is, in the best sense of the term, a popular work; for Mr. Klaczko carries the burden of his learning so lightly, he has reduced his critical apparatus to such a minimum, that the ordinary reader will only have a sense of the transparent clearness of the exposition, and the simplicity and communicative vivacity of the style.

We have here not a consecutive history of Julius II, but rather a panorama of changing pictures, in all of which the majestic figure of the fiery-souled priest who projected and brought to completion so many magnificent achievements towers above the artists he has summoned to his aid. Among the latter the chief is, of course, Michelangelo.

The author takes a rather favorable view of the character of the *pontifice terribile*. He shows that altho the successor of the scandalous Alexander was as warlike as a feudal lord, he was as chaste as an anchorite also, and that, with all his fits of temper and acts of violence, he had never been guilty of an act of cruelty, had never avenged a personal injury, and had sought no other grandeur than that of the Church. Whether or not we agree with this estimate it must be admitted that he understood the greatness of his country and the beauty of art; for this, much should be forgiven him.

We are not sure that Mr. Klaczko has discovered any new facts in the career of Michelangelo, but he has combined, with a keenness of vision that nothing escapes, all that perhaps can ever be known of his life at Rome and his relations with Julius, and he has analyzed, as far as was possible, the character of this extraordinary artist and wonderful thinker, leaving on one's mind the strange impression that Buonarroti's genius was superior even to his works.

The most important chapters, perhaps, are those which treat of the "Old Basilica," the "Sistina," the "Upper Rooms' and the "Camera della Segnatura." We feel, after reading them, that a flood of light has been thrown on questions which have been repeatedly discussed for centuries, especially in the study he devotes to the old basilica of St. Peter, whose demolition cannot be sufficiently deplored in spite, or because, of the splendors of the new one. His analysis of the ceiling of the Sistine Chapel is as penetrating as it is fascinating, and, whether his interpretation of the Camera della Segnatura be the correct one or not, it is certainly replete with charm. He succeeds in stamping on the reader's mind his own feeling of the grandeur and originality of these works.

Then, we have, in addition, a complete picture of the Roman life of the period, some fine esthetic pages on the fashion in which the Renaissance ignored the true genius of antiquity, and a number of intricate problems which, if not solved, are, at least, stated with all the precision of which they are susceptible, such as the real date and meaning of a celebrated sonnet of Michelangelo (p. 52).

Mr. Klaczko, while he does not hide the defects of the truculent Pontiff's qualities, has for him a sentiment of mingled affection and admiration, in which he almost forces the reluctant reader to

* ROME AND THE RENAISSANCE. *The Pontificate of Julius II. Translated from the French of Julian Klaczko by John Dennie.* With 52 illustrations. G. P. Putnam's Sons.

join him. Speaking of the farewell address delivered by Julius to the cardinals, just before his death, he says:

"We must recognize the fact that most of the members of the Sacred College had been restive under the reign that was now about to end. The Ligurian parvenu, who for nine years had dragged them from one end of Italy to the other in his army, had transformed them into aides-de-camp, into generals, had forced them to lie in camp as he did under the fire of besieged towns, was scarcely a Pope after the heart of these effeminate, refined eminences of the south. Leo X would be very much more to their liking. But when they approached the dying man, one by one, to receive his blessing and to kiss his hand there was not a single one among them all who did not weep and sob aloud. . . . At that solemn moment, the rancorous *porporati* perhaps said to themselves that there was needed nothing less than this *pontefice terribile* to lift the papacy from the profound abasement in which a Borgia had left it."

The work is profusely and magnificently illustrated. This volume, while it must have a great attraction for every one interested in art, should have a special value for those who intend to visit Rome.

A Standard Dictionary of the English Language. A new edition, revised and enlarged. Also Abridged Cyclopedia with Atlas of the World. Two vols., quarto. New York: Funk & Wagnalls Co.

Every ten years a dictionary or an encyclopedia needs re-editing. The conclusion of this term brings us a new and enlarged edition of the *Standard Dictionary*. The value of this dictionary is generally recognized and it might have seemed one of those that would least need to have their revision hurried. But such is the rivalry of dictionaries that a publisher can take no chances, but must correct and enlarge before the public fairly recognizes that the work has begun to go stale. The English language has never grown faster than during these last ten

Details from Raphael's "La Disputa" (St. Peter, Adam, St. John, David, St. Lawrence). From "Rome and the Renaissance," by Klaczko. (Putnams)

years. The South African War has introduced a multitude of new words, and the Spanish War has made us familiar with another crop of Philippine words. Besides, the growth of science has been marvelous, and hundreds of new terms are introduced. He is a poor writer on philosophy, sociology, biology or physics who does not invent a dozen or two words. Even THE INDEPENDENT has every little while to create a new word, such as *symbolatry*, for which Dr. Schaff, and the *Standard Dictionary* after him, wrongly prefer *symbololatry*, a finicality of accuracy in derivation that would give *idololatry* for *idolatry*. This new edition adds some three hundred pages and 17,000 new words or definitions of old words. And yet it is impossible to catch every word that creeps into the language. We can mention a few that we do not find, such as *illiterate* (noun), *laplands* or *laplanders* (cooked in a fluted gem-pan), *covert-cloth, Landmarker, malaric* (e.g., mosquitoes), *doublé* (inside of book cover), *shingle-crib* (engineering term) and *trollop* (trounce). But it is nothing against a dictionary that it omits a hundred or a thousand words; the wonder is that it includes so many. The 17,000 new words and definitions mean about five a day for ten years, Sundays included. Besides these new words there is a good set of maps of the United States and the world, in colors separating countries and counties, added to the first volume, also a compact geographical encyclopedia. The Appendix has been thoroughly revised and a dozen new features added, with new colored plates and illustrations in great number. We heartily commend the work, whether bound in one volume or two. It will be remembered that as much preference as possible is given to the shorter spellings, while great care has been bestowed on the pronunciations and the definitions.

The Russian Advance. By Albert J. Beveridge. New York: Harper & Bros., $2.50 net.

This book is largely a republication of newspaper letters written by Senator Beveridge during his travels in the Far East—or, as we ought rather to say, the Near West—in 1901, and, while, of course, it is not in the same class with such comprehensive studies of Russia and Siberia as those of Wallace and Leroy-Beaulieu and Krause, it will be more useful for most readers. It is the sort of a book which ought to be put into the public libraries. For the very reason that it is so elementary in character and so naïve in its point of view it

ALBERT J. BEVERIDGE

will do much to remove the fogs of ignorance and prejudice which, from the continual emphasis laid upon certain features of Russian life and policy in novels and melodramas dealing with "Darkest Russia," pervade the mind of the average American. He will be as surprised as was Senator Beveridge to learn that the "Russian advance," like the expansion of the Anglo-Saxon race, is a natural and inevitable movement of the people, which statesmen can to a certain extent guide and control, but not altogether check; that the Russian officer does not always carry a knout in his hand, figuratively speaking, but treats his soldiers more as a father does his children; that Russian statesmen can and will talk politics and even have something to say in defense

of hereditary autocracy in comparison with our own system of boss autocracy; that the Russian people are sincerely devout and their church service is beautiful and impressive; that Irkutsk has a museum and an opera house (the town is only 133 years older than the one Senator Beveridge hails from). The observations of such a clear-sighted and impartial man as the author on the appearance and conduct of Japanese and Russian soldiers in the territory which they seem preparing to fight over are timely, and if more of our statesmen would follow his example our foreign policy would cease to be a matter of chance and guesswork, and Senators of the "Dodge Club" species would be less conspicuous. Such a book needs an index and better maps, which, by the way, should not be on Mercator's projection. In the case of the map of "Russia and the remainder of Europe and Asia," the "remainder" looks too small to put on the bargain counter, and one would certainly not realize that Siberia is only three times the size of India. It would be interesting to know just how much of the awe and terror inspired by Russia's extent of territory are due to the nautical expedient of the Flemish geographer of the sixteenth century.

The Divine Processional. By Denis Wortman, D.D. New York: Fleming H. Revell & Co.

A poem by Dr. Wortman, entitled "Reliques of Christ," prepared the way for this even more ambitious volume, which, if it had a little more story, would be an epic. The little thread of story which runs through the four first cantos represents the Strangers as having come to earth from some star world, courteously received and shown the wonders of this world. But nothing surprises them, as all they see is so inferior to what the heavens have made familiar. They are in the mood of Moore's Peri:

> "Oh, where was there ever a gem that shone
> Like the steps of Allah's wonderful throne?"

until, wandering over the world, they happened on Judea, and there they were startled by a new emotion. Their finer sense recognized some tremendous drama as having there been enacted. By degrees they discover its meaning, nothing less than the sacrifice of the Son of God. Here was something that excelled and surpassed all their previous experience or knowledge. They hear the voice of Nature in sympathy with the Divine Sufferer. At last they hear the voice of the Father God, who addresses them and addresses Nature and Man. The purpose of the introduction of the Voice of the Divine Father is not so much to justify the ways of God to man as it is to express the love of God and his part in redemption, through the gift of his Son and through his indwelling in Nature and Man. The blank verse is interrupted frequently by short lyrics, like the Greek choruses. The whole mood of the poem is tender and reverent, but also often surprisingly modern in its expressions and in its scientific or historic allusions and illustrations. Indeed, at times it almost passes what is conventionally allowed to poetry, and in this way reminds one of Bailey's "Festus." The feeling of the poem is broad, hospitable and optimistic in the truest Christian sense, and while we are not ready to say that Dr. Wortman has proved himself a new Milton, yet there is an originality and fervor about his verse that make it well worth the reading.

A Century of Expansion. By Willis Fletcher Johnson. New York: The Macmillan Co. 1903.

This new volume on expansion is the work of a newspaper man rather than a trained historian. For this reason it is more suggestive and less scholarly. It brings the large outline into great prominence, and gives less of accurate and vital detail. There is more brilliant and sweeping generalization, with a consequent loss of conservative and weighty judgment. The freshness that comes with original research is lacking, but the wide reading of secondary works has enabled the writer to give the book a broader scope. The work is, on the whole, not a great or indispensable one, but is suggestive and readable and opportune. The writer himself says that he has no ambition to do his work with completeness. He aims rather "to present the salient features of the great story, succinctly yet with sufficient comprehensiveness, at least, to suggest where

it does not instruct." To Mr. Johnson the history of American expansion "involves the history, in a large measure, of Constitutional development and interpretation, of domestic institutions, of foreign relations, and of our whole national life." He points out very clearly that it was the lot of the United States to set an example to the world, "of a new system of expansion, in which the acquired territory became in due time sovereign and equal parts of the sovereign nation." The result of this method has been that the acquired territory has prospered, even tho acquired "violently and dishonorably," as were Texas and California. In a closing chapter called "Retrospect and Prospect," the author holds that the "Monroe Doctrine does not, in either letter or spirit, bar us out of Asia." Asia, he contends, is left neutral ground between Europe and America, "in which the latter has equal rights with the former, in both peace and war." After thus suggesting this field for expansion, the author urges in closing that expansion should never be an end in itself, but merely "a means for working out our highest national destiny."

South Carolina as a Royal Province, 1719-1776. By W. Roy Smith, Ph.D. New York: The Macmillan Co., 1903.

This new volume on South Carolina is not a history for popular use. It can have little interest for any but the special student of American and English constitutional history, but for them it is of great value. The author has based his whole work upon original, contemporary documents, both in manuscript and in print. He has ransacked the archives of the State, and has made use of private collections as well. Every significant statement is confirmed by references of convincing weight. Having no desire for popularity, the author has planned and executed the work in the manner of the most approved scholarship. Dr. Smith holds that the real history of the American Revolution dates from the founding of Jamestown. From that time until 1775 there was in every colony an unceasing strife between the representatives of the people and the defenders of the royal and parliamentary prerogatives. It was a miniature of the constitutional struggle in the mother country. In this monograph the author seeks to trace the progress of this struggle in South Carolina, hoping that he may throw some light upon the American Revolution. In a dryly scientific presentation, unrelieved by any attempt to offer matter of human interest, the purpose has been attained. The history is not treated cronologically, but is developed by subjects. A brief chapter on the proprietary period is followed by a study of the land system, its origin and development, the frauds connected with it, and subject of quit-rents. Next the Government, in all its departments, is fully discussed, and there is an interesting and valuable study of colonial agents—those lobbyists in England in the interest of the colony. After two chapters on the militia and the financial history, there comes the most interesting chapter of the book, "The Downfall of Royal Government"—a straightforward story of the steps that led South Carolina to enter the struggle for Independence. The author gives New England more credit for initiative in the Revolution than does McCrady and other Southern writers. There is a list of authorities and an index. The latter is the work of the author and not machine made in the office of the publisher. There is an intelligent appreciation of the subjects of real value in the book.

The Apocryphal and Legendary Life of Christ. By James deQuincey Donehoo, M.A. New York: The Macmillan Co., $2.50 net.

All the extra-canonical literature purporting to tell anything of the life and words of Christ, from the first century to the seventeenth, is here classified and made into chapters of the apocryphal Life of Christ. The material so arranged are the apocryphal Gospels and the portions of the apocryphal Acts and Apocalypses which refer to the Life of Christ; the Agrapha; the heretical, forged and hostile Gospels, Acts and Apocalypses, and the traditions reported by Church writers down to the seventeenth century. These various Apocrypha are brought into 38 chapters, such as The Birth and Childhood of Mary, The Betrothal and Annunciation, etc. Brief introductions set forth the origin and character of each apocryphal work. Notes furnish cross-

references, divergent readings and illustrative matter. The value of the New Testament Apocrypha is not to tell the Life of Christ, but to testify to the Christianity that prevailed at the time these strange writings were produced. That purpose is not served by this arrangement, but because one often desires to know all that is said in apocryphal literature on a given point in the Life of Christ, and the difficulty of bringing this material together as found in the usual editions, and because there is here some material not previously accessible in English, this volume is an addition to the valuable, labor-saving works of reference.

The Journal of Montaigne's Travels in Italy by Way of Switzerland and Germany in 1580 and 1581. Translated and edited by W. G. Waters. New York: E. P. Dutton & Co. Three vols., $5.00 net a set.

Very few of the lovers of Montaigne's Essays are acquainted with his Travels, and the editor in his introduction to this edition would persuade us that this neglect is altogether unmerited. For the student of Montaigne knowledge of these volumes is necessary, since in them he will find the source of many of the curious bits of information which are used in the Essays, and to those who are interested in the social conditions of the latter part of the sixteenth century they are also essential, but to the general reader they are not so entertaining as the name of the author might lead him to expect. The Travels were not discovered and published until 1774, and they are mostly written in the third person from dictation to his valet. Like most traveler's journals, they deal largely with the kind of food and quality of beds to be found in the various inns, and the narrative often seems to have more in it of the valet than of Montaigne.

My Friend Prospero. By Henry Harland. New York: McClure, Phillips & Co., $1.50.

Those who enjoyed "The Cardinal's Snuffbox" will want another story just like it, and here they have it. Given an Italian garden as the *mise en scène*, with well manipulated clouds and sunset effects, and as characters no supernumeraries, but only those essential to carry the story—namely, a young and witty English gentleman, incognito, a high-born Austrian lady of surpassing beauty, incognita, a naive little Italian girl for them to talk through, and a bountiful *dea ex machina* to supply the necessary 6,000 pounds a year, how could the course of love fail to run as smoothly and gracefully as a scene of a light opera, undisturbed by the passions and perplexities of real life. The heroine is said to have been drawn from Princess Christine of Lahn and Dyck, who lives at Schloss Wischenau in Moravia, and is a friend of Mr. Harland.

The Country Boy. By Forrest Crissy. New York: Fleming H. Revell Co., $1.50 net.

This is a book of pleasantly written sketches of boy life in the country; a topic treated by many recent as well as older writers, but while these stories have neither the humor of W. D. Howells or the snap of W. A. White, they give, by the patient accumulation of accurate detail, the effect of a painting in the manner of the Dutch school.

Honor Dalton. By Frances Campbell Sparhawk. New York: Fleming H. Revell Co., $1.50.

"Doth Job fear God for naught?" asks the Satan of the old drama, thus insinuating that every man has his price. From this doctrine the author of "Honor Dalton" dissents, if not formally, at least in characters whose purpose and actions illustrate the opposite conviction. Tho weakened by verbosity and over much sentiment, the story is bright and interesting, and from the ethical standpoint worthy of respect.

Florestane the Troubadour. By Julia de Wolf Addison. Boston: Dana Estes & Co., $1.00.

A tale of France in the old days when love made knights of swains and religion made men soldiers of the Crusades. It is written in the prose ballad style, and the interest depends upon the delicacy and charm with which the author presents the familiar details of a romantic age.

Editorials

Whom the Gods Would Destroy

THERE is no longer any pretense of concealment by the great corporations of their firm purpose to defeat any political candidate whose determination to bring trust activities under legal restraint is known. The Wall Street opposition to Mr. Roosevelt was brought to a head when the Administration began its suit against the Northern Securities Company. The President's determination to bring corporate activity within the bounds of the law and equity is perfectly understood, and no one doubts his stubborn persistence in a course that he has decided to be right. The conflict is irreconcilable, and one party or the other must be brought to terms.

Let us inquire what results may reasonably be looked for if the corporate interests can place in the Presidential office a man who represents their methods, who thoroughly sympathizes with the notion that America is for the millionaires, and that the common people ought to thank God that they are, on the whole, so well taken care of. Can they really accomplish the purposes that they have in mind, or will events so develop as to make them curse their folly, and wish that they had permitted a man like Mr. Roosevelt to carry out a moderate policy of legal restraint that might have averted the deluge?

In the first place, what do the promoters and corporate financiers think would have happened if the wild schemes of "the Street" had not been checked by the Northern Securities suit? It is no secret that when this suit was brought plans were making for the organization of four more great "mergers"—namely, a Southern Securities Company, a Southwestern Securities Company, a Western Securities Company, and an Eastern Securities Company. Suppose that all of these iridescent bubbles had been floating in the financial blue last September. Does any sane man believe that the immerged properties, which came through those days of distress greatly reduced in value, would have been worth anything whatsoever, or that any confidence could have been maintained? This much, at any rate, we know—that level-headed business men, whose transactions are of world-wide reach, have admitted in conversation that the bringing of the Northern Securities suit, by stopping those crazy schemes in their inception, probably prevented the most destructive panic in our history.

Turn now to the political aspect. It is notorious that New York City, cosmopolitan as it is, and in touch with the life of the whole civilized world, is always curiously ignorant of the thoughts and passions of the millions of "plain people" living beyond the Alleghanies, on the prairies and the plains. This ignorance is sometimes unfortunate. Political power long since passed from the Eastern States to the Mississippi Valley. More than fifty-three per cent. of our population now dwells in the region that drains to the Gulf of Mexico. In that region the interests that men have at heart are still relatively simple, and there are still cherished the ideas of elementary justice which have their source in honest industry as a means of livelihood, and which are incompatible with gigantic schemes for "raking off" millions of dollars by the easy process of floating old properties under new names. Any man who can acquaint himself with the history of Grangerism, Populism and Bryanism, and then believe that the Western population will submit to the election of a President selected for his known antipathy to the Roosevelt program, and his avowed eagerness to serve the trusts at their bidding, ought to take his mind to a dime museum as an exhibit.

The situation, we believe, is a grave one. We do not desire to see the economic organization of the Western World swept by a cyclone. Far better for all concerned will it be if by cautious legislation and firm administrative measures the supremacy of popular sovereignty and of the law of the land over great industrial undertakings can be asserted, and

great properties be saved from indiscriminate destruction. The idea of the promoters that they can direct American politics from Wall Street, and that they have only to defeat the ambitions of Mr. Roosevelt in order to have the continent to themselves, is the sheerest lunacy. The American people will yet control the economic life in the interests of the multitude. They will do it quietly and without destruction if they can. They will do it radically and in a spirit of vengeance if they are driven to bay. The time for the corporation interests to resume their reason is now. "Whom the gods would destroy they first make mad."

The Chautauqua Postal Frauds

THE effect of the postal fraud disclosures upon the fortunes of the Republican party will depend upon the party's treatment of those whom the public, with reason, believes to be guilty. There is no doubt anywhere, we think, as to the attitude of the President and his assistants toward the dismissed bureau officers and their fellow-conspirators who have been legally accused in nearly fifty indictments. One indicted man has been convicted; the others will be prosecuted with vigor. A ruling party loses nothing by its detection and earnest prosecution of dishonest employees. This investigation, however, has pointed to the probable guilt of persons who have not been indicted, and a majority of whom cannot be, but are not beyond the reach of some kind of punishment. If the leaders of the party shall continue to hold these persons in places of honor and trust, and shall fail to inflict upon them such punishment as may still be lawful, a loss of strength at the polls will thereby be invited.

In the Bristow report there were passages that were read with much interest in Chautauqua County, at the western end of the State of New York. They have since become the basis of grave charges against a Justice of the New York Supreme Court, Mr. Warren B. Hooker, who recently represented the Chautauqua District in Congress, and is said to have been a friend of George W. Beavers, the former Superintendent of Salaries and Allowances, who is now under indictment. The substance of these passages was as follows:

That Maurice Hooker (a nephew of the Justice) was appointed a laborer in the post office at Fredonia, Justice Hooker's home, at a salary of $400 per annum, which he drew for a year and a half, but did no work in the office. The Jamestown Bar Association asserts that at that time he was attending school.

That the postmaster at Fredonia was directed, in 1898, to appoint one Frank P. Ball as laborer, at $600 per annum, and that Ball was carried on the rolls until the end of 1902, receiving $2,532, "for which he rendered no service whatever, being engaged most of the time in business at Dunkirk."

That the same postmaster was directed to appoint Minerva Jeffery a clerk in his office at $600 per annum. He says that she did no work there and that he never has seen her. Payment was made by checks that were sent to Washington. "An examination of Beaver's bank account," said Mr. Bristow, "shows that these checks were deposited to his personal account."

That in the neighboring post office of Dunkirk, John A. Link was appointed a laborer in 1898, at $600 per annum, and that he drew pay until June 30th, 1903, $3,100 in all, "without rendering service." "He was a barber, and he continued to work at his trade during all that time."

That the post office in Dunkirk occupied premises for which it had a lease for five years, beginning in 1898, at $450 per annum; that a lease of rooms in a new building, for ten years, at $1,350, was executed in 1901; that by successive cancellations and new leases within eight months thereafter the rent was increased to $1,500, and then to $2,000, to which the Government was committed for ten years. Said Mr. Bristow:

> "No additional service was provided for in any of the subsequent leases that was not included in the lease at $1,350. It will be observed that instead of using the authority given by Congress to make long time leases, in order that better buildings might be secured for less money, it has been used for the benefit of 'grafters,' who seek to pillage the public revenues."

In resolutions adopted at a Republican

mass meeting in Fredonia it is asserted that the building in question was erected and is owned jointly by Justice Hooker and Lester F. Stearns, a State Tax Commissioner; that it is occupied also by a telegraph company, a telephone company, and other tenants, and that its assessed valuation is only $5,500.

It is now reported that the money received by young Hooker has been paid back, in response to the Department's demand, and that a part of the other illegal payments has been collected from the postmasters.

The disclosures summarized above caused much excitement and indignation in Chautauqua County. Prominent Republicans directed the attention of Governor Odell to the charges, complaining because he, after the publication of the Bristow report, had designated Justice Hooker to sit in Brooklyn as a member of the Appellate Division, an appointment carrying with it a large increase of salary. The Governor's response was so unsatisfactory that at a Republican mass meeting in Fredonia resolutions were adopted in which he was denounced as the foe of reform. It was also asserted that the postmasters involved had been appointed upon the recommendation of Justice Hooker. Then the Bar Association of the county considered the charges and forwarded to Justice Hooker a resolution expressing its opinion that he should make some answer to accusations of so grave and serious a nature. A week later, having received no reply, the local association submitted to the Bar Association of the State a long memorial, setting forth the facts but making no accusation. At a meeting held last week, that memorial was referred to the Standing Committee on Grievances for investigation, against the opposition of some of Justice Hooker's friends, who asked that it be laid on the table.

We express no opinion as to the guilt or innocence of Justice Hooker. We are publishing the official statement of the Government, the substance of the memorial of his own local Bar Association, and the assertions repeatedly and emphatically made to his discredit by meetings of his own party at his home. We should be glad to publish also his reply to all this, but we cannot learn that he has made any.

Turning from the purely personal and local aspect of the case, we say that here are disclosures and charges the treatment of which by those who lead the Republican party cannot fail to affect in some measure that party's fortunes. Mr. Bristow's report shows that certain persons have been guilty of fraud. How are they to be punished? Are they to be punished at all? The postmasters who thus conspired to rob the Government, or consented to assist in robbing it; the men who drew salaries fraudulently for years; the other men who suggested and procured the appointment of them and are believed to have profited by their unearned pay—are they to suffer no penalty? Are not the offenders in this case to be reached in some way by the Post Office Department, the State of New York, or the leaders of the Republican party either at Washington or at Albany? If not, then the party will enter the campaign under some disadvantage in the greatest of our States, where its success must depend upon the support of independent voters. It cannot afford to carry such burdens in New York, or to have the people of other States know that it is carrying them there.

The Abbé Loisy

Five of the books of the Abbé Loisy have been condemned by the Pope. The decree says:

> "Let no one, therefore, whatever be his grade or condition, dare read or retain the aforesaid condemned and proscribed works in any place or any language whatever, nor read them hereafter, under the penalties indicated in the 'Index of Prohibited Works.'"

These books are: "The Gospel and the Church," "As to a Little Book," "The Religion of Israel," "Studies of the Gospels," and "The Fourth Gospel." Cardinal Merry del Val in his letter to the Archbishop of Paris announcing the decision states that the grave errors that abound in these works relate especially to primitive revelation, the authenticity of the Gospel facts and doctrines, the

divinity and the knowledge of Christ, the resurrection, the divine institution of the Church, and the sacraments.

A well informed ecclesiastic of the Roman Catholic Church provides us this week with an illuminating article on the subject. The question may be asked whether he is a good and loyal Roman Catholic. As with so many other questions the answer depends on the definition. Can a man be a good and loyal Roman Catholic and yet disapprove of a papal utterance? We suppose he can. The condemnation of Galileo had papal approval; loyal Catholics do not approve it now. The massacre of St. Bartholomew was honored with a papal medal; good Catholics now disapprove of it. The last Pope condemned a bit of biblical criticism about the three heavenly witnesses, and Leo himself regretted his blunder. Half the American Catholics believe that the same Pope made an error when he condemned what is called Americanism in the Church. The condemnation of Loisy's doctrines is not one of those *ex-cathedra* promulgations of doctrine which come under the definition of infallibility; and we may truthfully say that the declaration of Infallibility by the Vatican Council itself is regretted by many good and loyal Catholics. It is therefore clear that our able correspondent does not read himself out of the Catholic Church by his unveiled disapproval of the interdict in the case of the Abbé Loisy.

Of course, the great mass of the Roman Catholic writers, who sign their names, will declare our correspondent, and men like him, to be disloyal, and will tell them to get out of the Church. It is always so. The conservatives always think that the Church belongs exclusively to them, that reformers have no place in it. A certain denomination in this country has been called "the roomiest Church in America," and yet those who think it belongs only to themselves are just now telling Professor Briggs that he came into it for his own convenience, and that he ought to get out, just because he teaches that its orders do not have exclusive validity. Bishop Potter, we are glad to know, finds nothing schismatic in Professor Briggs's address, which we publish this week.

The process of theological or ecclesiastical reform is about this: Scholarly investigation raises a question; it begins to be talked about and discussed. Soon some one in the Church boldly adopts and publicly defends it; he is charged with disloyalty and driven out by ecclesiastical censure or by public sentiment. But the new view thereby gains vogue and credence, and a multitude of other men think it plausible, or probable, at least tolerable, but they hold their view privately and express it only in conversation, or in those ministerial clubs where men speak in confidence and where new views spread unseen. At last the whole Church is permeated with the new thought, and it is allowed or accepted with no question, except by a few paleozoics, who resist evolution despite the elevation of mountain chains or the intervention of glacial periods. Thirty years ago good riddance was said to Baptist ministers who ventured publicly to defend and practice open communion; now we never hear of the discussion, because the open communionists own the Church. A dozen years ago Professors Charles A. Briggs and Henry Preserved Smith were suspended from the ministry by the Presbyterian General Assembly for their teachings of the Higher Criticism; the battle is over now and the Church is full of the higher critics.

So is it, and so it will be still, in the Roman Catholic Church. The Copernican theory is taught in all Catholic schools. Loisy is condemned, but it was a sad blunder. He does not recant his teachings, because he still believes them true. That is, he exercises the right of private judgment, which in these days will have to be allowed to Catholics under penalty that their twilight intellects must ever flee the approaching sun, enamored of rest in eternal crepuscule. Neither the Catholic Church nor any other Church is *semper eadem et ubique*,—always and everywhere the same. It is different in Italy from what it was in the days of Dante. It is different in the United States from what it is, or has been, in the Philippines, and American bishops are going there to reform it. What the Abbé Loisy is condemned for teaching to-day will be taught in Jesuit seminaries twenty years hence.

College English

It has been evident for some time that English, as taught in our colleges and universities, is by no means all it should be. If it were, there would be no such utter confusion in regard to aims and methods, no such general dissatisfaction with results, as obtain at present. One professor, for instance, is bringing up his students to write magazine stories. Another declares that a student has no business to write anything at all—certainly nothing original. A short time ago a popular Rhetoric undertook to settle every difficulty by turning the usual order of topics end for end—and naturally had a great success for a while. At present Rhetorics and other systematic means of instruction are very much in disrepute; and the favorite medium consists of a mixture of pictures, questions and scraps of literature, which are supposed for some reason or other to stimulate the pupils' productiveness. In the meantime, however, while the teachers are entertaining themselves and the public with these ingenious and curious experiments, the ability to write good English appears to be declining, if not *pari passu* with the efforts made to educate and train it, at least in a manner to prove their futility. The Oxford or the Cambridge man seems always to have written his own language creditably without other training than that which he got from the study of Latin. And fifty years ago, when there were few or no English courses in our own colleges, the student was to all appearance as capable of expressing himself with facility and propriety as is the present undergraduate with his elaborate and complicated training.

Of this unfortunate state of affairs there is, in our opinion, but one explanation. A certain professor of English used to bewail the perplexities of his subject. "How am I to lecture on such a topic," he would exclaim, "where everything that is true is self-evident, and everything that is not self-evident is false!" And his complaint, tho exaggerated, contains a solid kernel of sense. The fact is that English is over-taught—or, rather, it is taught too exclusively for its own sake, without reference to other matters of much greater importance.

The fault is natural to the present policy of excessive specialization. The historian teaches as tho there were nothing else in the world save History, and his students were all to become historians; the physicist as tho there were nothing else save Physics and physicists. Every department tends to monopolize and engross its members, and looks at other departments askance as dangerous and intrusive rivals. As a result instruction becomes daily more one-sided, narrow and jealous, more widely estranged from life and more fatally prone to take refuge in the purely technical and recondite. And the spread of the elective system continues to aggravate the mischief. It is impossible that any subject should be taught as it ought to be—and particularly English. For English occupies a peculiar position among the other studies of a curriculum. It is valuable neither as method, like physics, nor for its information, like chemistry, nor yet as a mental discipline, like mathematics. It is serviceable merely as a means to an end, as a process whose materials must be supplied from without. To insist, therefore, upon teaching English as a closed subject, without reference to the real branches of knowledge whence its contents are to be extracted, is the hight of absurdity.

What our colleges and universities most need at present is some rational organization of courses, whereby every subject shall be properly associated with its fellows and restored, as a whole, to a fair participation in life. But from the very nature of things this requirement is indispensable in the case of English. In some colleges the work in debating is already carried on conjointly with history and political economy. And if matters could be so arranged (as they could at half the present expense and complication) that the student might utilize the material supplied in course toward the discipline of thought and expression, the problem of efficient English instruction would be well nigh solved. For the fact is that the college student has as yet nothing of his own worth writing; and the effort to reduce his crude and tenu-

ous ideas to shape and consistency tends, not only to fill him with a strong if mistaken sense of the inanity of literature in general, but also to breed in him vicious habits of thinking as well as of writing, since the one reacts inevitably upon the other. For this reason the so-called laboratory method, which insists upon galvanizing the student to original production, is probably the most mischievous of all these recent experiments, inasmuch as it must needs set a thoroughly false value upon undergraduate attainments in order to succeed at all. In our opinion the translation of Latin, or of some modern language, whose idiom is not too like our own, offers the best elementary discipline in writing, since the happy alliance of idea and form just meets the student's peculiar deficiencies and sets him a task well adapted to his needs. Such, whatever may be thought of it, is the sort of training on which English letters have grown and flourished. We shall have something further to say on this subject.

Chemical Fire-Extinguishers

DURING the fire in the Iroquois Theater, when the flames were just creeping up the hangings on the side of the stage, one of the stage men seized a hand-grenade and threw it upon the flames, with no other result, he says, than to get his eyes filled with salt water. This emphasizes the fact, which has long been known by those who have examined into the matter, that the chemical fire-extinguishers which are so carefully fastened up in public places, and upon which so much reliance is fixed by the public and the proprietors, are in most cases of little more value as a preventive than is the asafetida bag tied around the neck of a school boy as a prophylactic against all manner of contagious diseases. In fact, not so much, for it may be that in the latter case the imagination of the individual may assist in warding off disease; while it is not known as yet that faith or mental power will do anything toward extinguishing a fire which is under good headway.

Chemical fire-extinguishers of the hand-grenade order are supposed to act in three different ways; first, by the development of gases capable of extinguishing a flame; second, by coating the inflammable material with an incrustation of salts of some kind; third, by extinguishing the fire by the action of the water which they contain. The best chemical fire extingishers are composed of solutions of carbonic acid gas absorbed by the water under pressure; as soon as the pressure is relieved by the breaking of the container this heavy gas spreads through the vicinity, and since it is in itself a non-supporter of combustion and shuts out the air, all fire in the region through which it spreads is necessarily extinguished. The action, therefore, of a hand-grenade charged with carbonic acid gas under pressure is very much more efficient than the action of those where the solution has to be applied to the flame itself in order to extinguish it, because it is then impossible to throw the contents directly upon the source of the fire, as in the case of blazing drapery or curtains, and besides it is not every one who is cool enough in such an emergency to throw straight, even if he knows exactly where the root of the flame is.

Very few hand-grenades upon the market are thus charged with carbonic acid gas under pressure. Many of them attempt to reach the same result in a much cheaper manner by using some salt which, by the action of fire, will develop gases capable of quenching the flame. Of these salts the most important are the ammonium salts and bicarbonate of soda. All ammonium salts decompose with heat, producing non-combustible gases, and bicarbonate of soda gives off carbonic acid at high temperatures. These are useful, therefore, in case the contents of the vessel can be thrown directly upon the fire.

But both the salts of ammonia and bicarbonate of soda are somewhat expensive, and since fire extinguishers are generally bought, not by chemical analysis of their contents but on account of the beauty of the receptacle or the eloquence of the agent, it has been found more profitable by the manufacturers to fill them—we refer to the grenades, not the agents—with brine or the liquid refuse from some chemical manufactory. Even in this case the extinguishing power of such a solution is greater than that of so much water, because of the

partial volatilization of the salts at high temperature and the effect, already mentioned, of coating the inflammable material with the residue left on evaporation and, to a certain extent, rendering it incombustible. Such hand-grenades, also, have the advantage over water of always being ready for use and of not freezing in a cold building. Fire-buckets, it is found in practice, cannot be kept filled with water without more attention than is generally given to such precautions, and the buckets themselves—no matter how red they are painted nor how much they are decorated with prohibitory legends—will be carried off.

A form of fire-extinguisher now extensively sold under various fancy names substitutes for the solution a dry mixture of salts, usually in a long tin tube. The contents generally consist of common salt and bicarbonate of soda, of course in their cheapest commercial forms. Such a fire-extinguisher, making a liberal allowance for the cost of the tube and the brilliantly colored wrapper with the picture on it, probably costs the manufacturer about fifteen cents; it is sold for two dollars, altho if you work hard you can beat the agent down to twenty dollars a dozen. The mixture is, of course, fairly effective for extinguishing a fire if thrown directly on the burning material, and at a reasonable price such extinguishers are good things to have around.

The most efficient of the chemical fire-extinguishers are modifications of the old Babcock fire-extinguisher, and consist of a solution of bicarbonate of soda with a bottle of sulphuric acid so arranged that it can be broken by turning a screw or by simply inverting the apparatus. A short hose is attached, and without much skill on the part of the operator a stream of water, charged under pressure with carbonic acid gas, can be directed on the fire. The hand-grenade is apt to be thrown wildly, and often on account of the smoke the source of the fire cannot be seen; but with this form of extinguisher the stream of water from the hose can be directed on the remnants of the fire as the smoke clears away. If the fire is under such headway that the contents of one of these does not extinguish it, it is time to run any way, and turn over the job to the fire company.

The method of selling these fire-extinguishers in country towns is to build a large fire of boxes and excelsior in one of the principal streets, which, of course, immediately draws a crowd. After the flames have spread sufficiently to give the whole pile the appearance of a house afire, a well-directed hand-grenade thrown by the operator extinguishes the flames instantly. The trick consists essentially in knowing just where the fire is situated and getting the contents of the grenade exactly upon that point, and in most such spectacular fires a quart of water as carefully placed would produce precisely the same result. However, these traveling agents do a great deal of good in their missionary work by arousing people to appreciate the importance of having some method at hand in houses and public buildings for the quicker extinguishment of incipient fires, and it is undoubtedly a good thing that people should not consider a public building properly furnished until it has at least "nine green bottles hanging on the wall."

The Mosely Educational Commission

It is a common saying that the chief advantage of foreign travel is that it makes one so glad to get home. This seems to have been the effect of their visit to America on the Mosely Commission. The Chief Inspector of Secondary Schools in Liverpool began a recent address with the statement that "any one who went to America, where he had been for the last two months, came back with a feeling of thankfulness that he lived in England." Other members of the Commission agree with him in thinking that England has less to learn from America on school matters than they thought before they went; and, while they admit that we are ahead of the old country in some points, still it would be very risky to attempt to imitate us in these respects.

This feeling of self-satisfaction is eminently British, and no doubt a very comfortable mental state, tho it may be

doubted whether it was exactly the result desired when Mr. Mosely invited this distinguished body of thirty-one educators and school officials to study the American schools at his expense, to see in how far the prosperity and progress of the United States were due to its school system. Still he had much the same experience with his Industrial Commission, most of the members of which seem to have concluded that tho the American workingman gets higher wages and more luxuries, he is not, on the whole, any better off than the English workingman.

What seems to have struck the Mosely Commission most forcibly about our school system was that there is no "system" about it. They found some "universities" inferior in grade to some colleges, and some "colleges" with lower standards and poorer equipment than some high schools, and came to the conclusion:

"Of the American college and the American degree may be said, *mutatis mutandis*, what has been said of the Etonian tutorial system, that no one but Etonians can understand it, and they cannot explain it."

They find a lack of definite educational ideals and fixity of purpose, which seems to them to lead to chaotic and desultory training and waste of energy. At the same time they recognize that this flexibility and fondness for experiment has its advantages. They say:

"There is no doubt that we need more freedom in this direction, and that our ancient Universities would do well to recognize a wider and more varied standard of culture."

Two of their criticisms seem to us very sound and worthy of our attention. One is that our colleges and high schools attempt too much, and so run the risk of not doing anything well. This is certainly a noticeable tendency in American institutions; each wants to have everything that every other has. No matter with what definite and peculiar aim a school may have been established, it tends toward the common type. The agricultural and mechanical colleges add literary and classical courses, and the old-fashioned college takes on technological features.

The other vulnerable point which they point out in our educational practice is that the teaching in the secondary schools and colleges aims too exclusively toward intellectual cultivation rather than the formation of character; and, accordingly, teachers are chosen more for their attainments than for their personality. Admitting that one essential, at least, for a professorship in a university is profound knowledge and the ability to conduct and stimulate research, still it is certainly not so important that the teacher in the lower grades should be an eminent specialist, as it is that he be a man of wide knowledge and sympathies, and of sound and sane influence. The tendency to disregard this has led to the displacement in many places of men who were in the prime of usefulness, tho not in the prime of life, in favor of young men fresh from the university, who, however superior in their training, are yet deficient in some elements of character quite as important in those who would be "guide, philosopher and friend" to young men.

Of the greater liberality of our rich men to educational institutions, whatever may be the cause, and the greater willingness of our people to submit to heavy taxation to support the schools, the Mosely Commissioners speak with great admiration. The London School Board is commonly denounced as extravagant because it expends $22.90 per head for the education of children under 14, while Boston cheerfully pays $27.50 for the same purpose. In England only 5 boys and girls per 1,000 receive secondary education, while in the United States, as a whole, black included, the average is 10 per 1,000, and in the progressive States of the Mississippi Valley it is 20 per 1,000.

Our custom of saluting the flag seemed to our visitors "a theatrical display," and such a sentimental procedure evidently struck them as unfavorably as it did the school boys in Kipling's story. But they realize the advantage of it in promoting a feeling of national unity among a population so largely foreign, and the *Times* expresses the opinion that the practice might well be imitated in England and in the King's dominions beyond the seas, where the flag waves over such a multitude of nationalities.

The *Times* also seizes from the Mose-

ly Commission a weapon to defend the Education Act, and says:

"To a citizen of Boston, or of Chicago, or of Philadelphia, it appears incredible that we in this country could suffer our educational system to be clogged and hindered by the trivialities of Dr. Clifford and the passive resisters, or by the ridiculous pretenses which have been advanced in support or in extenuation of their vagaries."

In reply to this it may be confidently asserted that if any attempt were made in this country to put schools supported by public money under the control of a State Church, with denominational requirements for teachers, it would meet with a resistance anything but passive.

The Referendum Upheld

About the last objection that one would imagine could be made against the plan of direct legislation by referendum is that it violates the Constitution of the United States, which guarantees a republican form of Government to the States. One has to pummel his brains to discover anything unrepublican in allowing the people to vote whether they want a law or not; but the objection made is that, being democratic, this cannot be "republican," as if there were, in this land of town-meetings before we had constitutions, any conflict between the two. But the question has been brought to the Oregon Supreme Court, which was asked to decide on an amendment to the State Constitution providing for direct legislation. The court declared, of course, that the Initiative and Referendum amendment does not destroy the republican form of Government, nor substitute another in its place, but that the people have simply reserved for themselves a larger share of legislative authority without overthrowing representative government. It is incredible that the United States Supreme Court will reverse this decision. Three other States, Massachusetts, Missouri and Nevada, last year passed amendments providing for direct legislation.

A Letter of General McClellan

A letter of Bishop Keiley, of Savannah, in *The Baltimore Sun*, tells a curious story about General McClellan which, if true, would make him guilty of treason while in command of the Army in 1862. Bishop Keiley says that he more than once was told by General Longstreet that immediately after the battle of Antietam, or Sharpsburg, when he was in General Lee's tent, the General handed him a letter he had just received from General McClellan, which proposed an interview between himself and General Lee. Generals Lee, Longstreet and Cobb judged that there was no construction to be placed on the letter but that General McClellan wanted them to end the war then and there by having the combined armies march to Washington and restore the Union. General Lee felt that the proposal was not properly sent to him, but belonged to President Davis, to whom he referred it, declining the interview. It would be interesting to know whether General McClellan had President Lincoln's consent to such an interview with General Lee. If not, and if his purpose was correctly divined in his extraordinary request, it was nothing less than the rankest treason, and the fact thus divulged justifies the judgment which held him to be only half-hearted in the performance of his military duties.

President Hadley on Public Office

The full report of President Hadley's address relieves it, as we hoped, of all serious criticism. He advises every man to connect himself actively with the political party which best meets his views, and not to accept any lucrative office until he has means enough to be independent, or some business or professional career to which he can return for support. In that way he can afford to give up an office if the position of the party is one which he disapproves, and will not be tempted to stick to it for support for his family; or if he is defeated as a candidate the financial loss will not be a serious one. Having thus obtained "the necessary minimum for self-support," President Hadley says:

"I should advise him to connect himself with the party whose attitude, on the whole, most meets his view of what the country is going to need in the long run in the way of measures and men. When he is in full sympathy with what that party is doing he should identify himself with it as prominently as possible. When he thinks it is doing badly he

should keep out of those offices where he will be forced to support measures which he disapproves. . . .

"If it happens that a man can find within the councils of his party a leader somewhat older than he is, and whom he trusts thoroughly and to whose fortunes he can attach himself, I believe it to be a good thing. The fact that this sort of attachment between a leader and followers is so often used for bad ends in American politics should not blind us to its rightness and excellence when it is used for good ends.

"The man who becomes a free lance in either politics or religion habitually loses more in the way of influence for good than he gains in the way of independence from evil. His error is almost as great as that of the man who so completely sinks his individuality in the party that he is not able to improve its standards or insist that it shall become a means of service to the nation."

President Hadley's views are both practical and ethical. His good sense holds him from going astray, and we observe that he did not sign a paper condemning the Administration in the Panama matter which bore the signatures of some New Haven men of distinction.

Spencer and the Decimal System

The clause in Mr. Spencer's will providing for the future publication of his articles in opposition to the metric system shows that neither the arguments nor the facts brought against his position changed his opinion. It will be remembered that he opposed the metric system on the ground that the duodecimal division, or counting by twelves, is superior to the decimal arithmetic now in use. In this he was probably right, but a change of the method of numeration and calculation in use all over the world since the fall of the Babylonian empire is too remote for serious consideration, and has no bearing on the metric system, which attempts the comparatively easy step, already accomplished in most countries, of bringing our weights and measures into harmony with our arithmetic. Whether the metric system is adopted in English speaking countries or not, some decimal system is inevitable, as is shown in the United States by the division into hundredths of the mile and the inch and the practical displacing of the bushel and "long ton" by units divisible by ten. England is also moving in the same direction. Last year the Liverpool Cotton Association dropped the old binary system of quotation by halves, quarters, eighths, etc., and adopted the decimal method of quoting by tenths. The British Government has now gone a step further, and authorized the use of a weight of 50 pounds in place of the present so-called "hundredweight" of 112 pounds and the "half hundredweight" of 56 pounds. The Liverpool merchants and chambers of commerce in other places have petitioned for this reform for many years. It may not be long before the English will find out the falsity of the statement made by Mr. Spencer that it is easier to calculate in their present system of farthings, pence, shillings, pounds and guineas than in a decimal coinage, like our dollars and cents.

Taxing Suffrage

One of the worst provisions of law as related to suffrage is that which in some States makes the previous payment of a poll-tax a condition of the right to vote. The purpose of the law is to restrict suffrage to those who care enough for the right to pay one or two dollars a year for it. It is thought that in that way the ignorant and incompetent will be shut out, and those shall vote that have the money. It is in the line with the laws often proposed, and actually still in force in one or two States, as in Rhode Island, under which property conditions are made for the suffrage. The best way is the most democratic, which attempts not to exclude, but to include, as many as possible, and then make them fit to vote. We observe that the Virginia papers are much disturbed over the working of the poll tax provision in that State. The law has acted as a boomerang, and has excluded a vast multitude of white men who failed or forgot to pay the tax and so are not registered. As one of the Virginia papers says, it is like the working of the scheme to introduce sparrows into New York to eat the worms. Now we are looking for some sort of big worm to eat the sparrows.

Service Pensions

Doubtless this is a rich country, or our lawgivers would not be rivaling each other with schemes to exhaust our surplus receipts. Several men in both Houses

of Congress are proposing bills to expend twenty-four million dollars for good roads; and scarcely are we over the feeling of surprise before half a dozen more are racing to claim the honor of their names for a universal service pension bill, which shall pension all soldiers of the Civil War who have thus far escaped the annual pecuniary gratitude of their country. It may cost an added hundred million dollars, or two hundred—nobody knows. Such a law does not seem necessary. Those who have been at all incapacitated through sickness or wounds received in service are already provided for, as also their widows. We are not at all pleased with the activity in this direction of the Grand Army of the Republic, which might be doing better service than everlastingly besetting the Treasury. It looks a good deal like one of the schemes to prevent the reduction of taxation. What the country needs is economical, but not stingy, support of the public service, and then the steady reduction of the national debt, and the coincident reduction of the tariff and of internal taxation. Happy is the land that has no debt.

THE INDEPENDENT, like all the other papers, and trusting the same information, spoke of the asbestos curtain in the Iroquois Theater as having proved to be no protection whatever, and to have collapsed under the heat. We have a communication from the manufacturers, who declare that investigation made since the fire shows that it was not lowered, but that by mistake the drop curtain was lowered and burnt, and that it was pieces of "burlap-backed" screens covered with mineral paint that were mistaken by reporters for the asbestos curtain, and that the latter fell when the supports were burned away, unconsumed, and was frozen solid afterward. They have recovered pieces of it that show that it fully resisted the fire, and they declare that if it had been lowered it would have shut off the flames and no lives would have been lost. We are glad to publish their statements.

It may well be a matter of interest to THE INDEPENDENT that the British Government has released Col. Arthur Lynch from prison, to which he was condemned for life for treason, as he had taken arms with the Boers against Great Britain. Colonel Lynch wrote several interesting articles for THE INDEPENDENT on his experience in South Africa, and was elected to Parliament by an Irish constituency, but when he returned from France to claim his seat he was arrested. There was no possible question that he had fought against his country. We are not sorry that President Roosevelt interested himself in his release, which is a gracious act toward Ireland.

This is what President Woodrow Wilson, of Princeton University, said in an address at Montclair, N. J., the other day:

"Because of our Americanism we had no patience with the anti-imperialist weepings and wailings that came out of Boston, not because we didn't think them entitled to their fair opinion, but because we knew that the crying time was over and that the time had come for men to look out of dry eyes and see the world as it is."

President Wilson is not quite exact. The weepings did not represent so much Boston as sub-Boston and sub-Springfield and sub-New Haven—the Gamalielites of the lower caves where grope the eyeless amphibia, and out of which wail the gusty subbings and sobbings which imaginative souls take to be the voices of Themis and the Erinyes.

The proposed marriage of the Archduke Frederick Charles, nephew of the Austrian Emperor, with the daughter of a university professor, is forbidden as a misalliance. We do not see why. A university professor ought to be quite as good as a grand duke—and, doubtless, the professor's family has had much less scandal in it.

The election of William E. Huntington, D.D., who has since 1882 been Dean of the College of Liberal Arts of Boston University, as President of the University, is a happy conclusion, and it protects the institution from the threat that it might be captured by flibbertigibbet mischief-makers.

Insurance

Interesting Decision on Suicide

A DECISION has recently been rendered by the Supreme Court of Ohio, in which it is held that the suicide clause in insurance policies is without effect. The case inspiring the decision was that of Lucas Hanner, administrator, against the Ætna Life and the National Life. According to the evidence, one Charles Hanner insured his life for $15,000, and two months afterward he committed suicide in the city of Chicago. His policies expressly stipulated that suicide within two years would vitiate the contract, but concurrent decisions rendered by both lower and higher courts are to the effect that these clauses are void in law.

The Berkshire Life Insurance Company and Its New President

THE Massachusetts insurance commissioner, who has examined the accounts, property and affairs of the Berkshire Life Insurance Company, of Pittsfield, Mass., has made a report which is highly complimentary to that company. He has characterized as wise the conservative management of the company and has expressed satisfaction as to the company's observance of the law as to the reserves for premiums and other liabilities. Satisfactory progress in the volume of business transacted by the company has also been made during the year just closed. No exception is taken as to the company's methods, which are reported to be systematic and painstaking. The policy holders receive liberal treatment and all just claims are promptly paid. The officials are entirely competent. The assets of the company exceed $12,000,000. William H. Swift, of Pittsfield and Chicago, and D. A. Kimball, of Stockbridge, Mass., were recently elected directors. Mr. James W. Hull, the new President, was Secretary of the Berkshire Life Insurance Company from February, 1872, until December 21st, 1903, and held the office of Treasurer from April, 1878. Mr. Hull was elected President of the Berkshire on December 21st, 1903.

Insurance Statements.

PROVIDENT SAVINGS LIFE ASSURANCE SOCIETY, NEW YORK.

The Provident Savings Life Assurance Society, of which Edward W. Scott is President, may well be proud of its record for 1903. Forty-two million dollars of assurance written, a gain of nearly $7,000,000 over 1902; income of $4,205,081, an increase of $83,747; assets of $7,310,138, more than $1,000,000 greater than a year ago; a surplus of $1,030,999, as against $983,676 at the beginning of 1903—these are some of the notable features of the twenty-ninth annual statement, which is just published, and which may be read in detail on another page. The amount paid to policy holders during the year was at the rate of nearly $1,000 for every working hour of every business day. The total assurance now in force is $105,000,000, and the amount paid to policy holders and now held for their benefit is $30,000,000. Not a single death claim which is due remains unpaid.

ATLANTIC MUTUAL INSURANCE COMPANY, OF NEW YORK.

In conformity with the company's charter the trustees of the Atlantic Mutual Insurance Company have issued their financial statement for the year 1903. Interesting items in this statement are as follows: Total marine premiums, $3,974,516; income from interest, rents, etc., during the fiscal year, $448,108. Losses paid during the twelve months covered by the report, less salvages and reinsurances, were $1,177,016. Six per cent. interest on the outstanding certificates of profits will be paid to the holders thereof or their legal representatives on and after Tuesday, the 2d of February next. A dividend of 40 per cent. is declared on the net earned premiums of the company for the year ending December 31, 1903, for which new certificates will be issued on and after Tuesday, May 3d. A. A. Raven is President of the Atlantic Mutual Insurance Company.

THE TRAVELERS INSURANCE COMPANY, OF HARTFORD, CONN.

During the year just closed the Travelers Insurance Company has added over $3,000,000 to its resources, which now amount to over $40,100,000. The reserves to insure the payment of Life Policies and to protect Accident Policies have been increased $3,180,000, making the reserve funds at the close of the year $34,460,000. The total cash income from all sources amounted to $11,670,000, which was an increase of $1,460,000 over the previous year. Payments to policy holders amounted to $4,200,000, making total payments by the company since organization of $54,000,000 in round numbers. Seventeen thousand one hundred accident claims were paid during the past twelve months. Sylvester C. Dunham is the President of the Travelers Insurance Company.

THE PRUDENTIAL INSURANCE COMPANY OF AMERICA.

The following figures are taken from the report of the Prudential Insurance Company of America:

Life insurance issued and paid for during 1903, including ordinary insurance ($102,822,648), over	$293,000,000
Assets, end of 1903, over	$72,000,000
Income during 1903, over	$39,000,000
Paid policy holders during 1903, over	$11,000,000
Surplus, end of 1903, over	$10,000,000
Number of policies in force, over	5,000,000
Increase in paid-for insurance in force, over	$129,000,000
Making the grand total of paid-for insurance in force over	$931,000,000
Total payments to policy holders in twenty-eight years, over	$79,000,000

The President of the Prudential, whose items are written in millions, is John F. Dryden, United States Senator from New Jersey.

THE NATIONAL LIFE INSURANCE COMPANY (MUTUAL), OF MONTPELIER, VT.

The fifty-fourth annual statement of the National Life Insurance Company shows that the company has now assets of $28,363,797.97. The surplus of the company has reached in total to $2,928,310.16. The following are interesting increases during 1903:

Increase in insurance	$7,391,080
Increase in assets	3,028,768
Increase in income	475,417
Increase in surplus	343,546
The amount of insurance isued during 1903 was	20,822,389
The total amount of insurance in force is now	125,692,778

Joseph A. De Boer is President of this company, James T. Phelps is Vice-President, and James B. Estee is Second Vice-President.

SPRINGFIELD FIRE AND MARINE INSURANCE COMPANY, OF SPRINGFIELD, MASS.

This company, which was organized in 1849, according to its annual statement just issued now has a net surplus of $1,620,489.94 and a surplus as regards policy holders of $3,620,489.94. The total assets of the company have now reached $6,282,402.15. The increase in assets over last year has been $254,989.09. There has been an increase of $202,804,48 in the reinsurance reserve of the company and an increase in net surplus of $108,419.44. The President of the Springfield Fire and Marine Insurance Company is A. W. Damon.

THE AMERICAN FIRE INSURANCE COMPANY, OF PHILADELPHIA, PA.

The ninety-fourth annual statement of the American Fire Insurance Company, of Philadelphia, shows total assets of $2,832,840. Last year the amount was $2,534,984, so that there is a gain of $297,856. The reinsurance reserve has increased $101,349 and is now $1,812,129. The net surplus, which is $354,025, is $174,204 greater than it was one year ago. The President of the American Fire Insurance Company is Thomas H. Montgomery. John H. Packard, Jr., is Vice-President and Secretary.

PENN MUTUAL LIFE INSURANCE COMPANY, OF PHILADELPHIA.

The fifty-sixth annual statement of the Penn Mutual Life Insurance Company, of which Harry F. West continues as President, again shows a gratifying increase of over $6,000,000 in assets, the gross assets on January 1st, 1904, having been $61,116,235.48. The total surplus, as shown by the company's last statement, reaches $7,423,468, which is a gain of $681,539 for the past year. New insurance written during the same period was $69,728,754. This was $95,977 in excess of last year.

ÆTNA LIFE INSURANCE COMPANY, OF HARTFORD, CONN.

The fifty-fourth annual statement of the Ætna Life Insurance Company, of which Morgan G. Bulkeley, formerly Governor of Connecticut, is President, shows great gains in business during the past year. The increase in assets was $4,661,633, making a present total of $68,155,179 in this department. There was an increase of $1,742,074 in total income, account, and an increase in life insurance in force of $12,002,866 and of accident insurance in force of $9,067,034.

NATIONAL FIRE INSURANCE COMPANY, OF HARTFORD, CONN.

The statement of the National Fire Insurance Company, of Hartford, Conn., dated January 1st, 1904, shows a net surplus to the credit of the company of $1,823,258, which is a net gain over last year's figures of $272,456. The total assets of this company are $6,463,828, an increase of $258,434. The President of the National Fire is James Nichols.

THE MANHATTAN LIFE INSURANCE COMPANY.

The annual statement of the Manhattan Life Insurance Company shows that the company has made substantial progress. The total assets of this company are now $17,807,225.07. The surplus is $1,879,430.69. The total payments to policyholders since organization and amount now held for their benefit are $69,987,665.99. The President is Henry B. Stokes.

THE MUTUAL BENEFIT LIFE INSURANCE COMPANY, OF NEWARK, NEW JERSEY.

The fifty-ninth annual statement of the Mutual Benefit Life Insurance Company, just issued, shows an increase in total receipts of $998,415; in assets of $4,625,162, and in surplus of $328,843 in 1903 over 1902. Mr. Frederick Frelinghuysen is the President of the Mutual Benefit Life Insurance Company.

SUN INSURANCE OFFICE OF LONDON.

The Sun Insurance Office of London has just completed its 194th year of active business. The Trustees of the funds of the office in the United States are John J. McCook, Herbert L. Griggs and James May Duane. The statement of the condition of the United States branch, just issued by these gentlemen, shows an increase in reserve and surplus. The assets of the company are $2,911,882.

Financial

Financial Items

THE Steel Corporation's profit-sharing plan is still in force. This year the subscription price of preferred shares is $55; last year it was $82½, and 48,933 shares were taken by 27,379 employees.

....Valentine P. Snyder has been elected a director of the Audit Company, of New York, to succeed T. Jefferson Coolidge, Jr., and Cornelius Vanderbilt a director to fill a vacancy.

....J. P. Morgan & Co., of this city, are offering for sale five-twenty four per cent. collateral trust gold bonds of the Louisville & Nashville Railroad Company at 96½ and accrued interest.

....It is estimated that the cost of making steel rails at the Corporation's mills will be reduced from $14 to $12 per ton by the new scale of wages. The combination selling price of $28 is still maintained.

....According to the figures of the *Daily Stockholder,* this year's January payments by corporations for interest and dividends ($115,565,000) exceed all previous totals except that of 1902, which was $118,199,000.

....In December the output of pig iron was only 898,000 tons, against 1,570,000 in December, 1902, and 1,596,000 in September last. The weekly output on January 1, was 197,931 tons, the smallest since September, 1897.

....The Board of Trustees of the Provident Loan Society, of New York, has decided to increase the amount of certificates of contribution from $500,000 to $1,000,000. These certificates bear interest at the rate of 6 per cent. annually.

....During the last three calendar years the railroad companies of this country have given very large orders for equipments—497,623 freight cars, 8,648 passenger cars, and 12,288 locomotives. There was a marked decline, however, in the second half of 1903.

....The last of twenty suits against the New York Central Railroad Company for deaths in the Park avenue tunnel disaster was settled last week for $40,000. For accident and death claims growing out of this collision the company has paid about $1,200,000.

....Attorney-General Cunneen has ruled that the $7,000,000 of Philippine land purchase bonds are not a legal investment for the savings banks of the State of New York, because the faith of the United States is not, in a strict sense, pledged for the payment of interest and principal.

....The annual statement of the Fidelity Trust Company of Newark, N. J., of which Uzal H. McCarter is President, shows total assets of $25,929,168, a gain of nearly $6,000,000 during the past year. The surplus is $6,500,000, a gain of $3,000,000. Deposits now amount to more than $16,000,000.

....For the $10,000,000 of 3½ per cent. gold bonds sold by the City of New York last week the average price obtained was 100.23. Many awards of small lots were made. The largest award was $4,400,210, to Harvey Fisk & Sons and Farson, Leach & Co., whose joint bid, at 100.077, was for the entire issue or any part of it. The average price is the lowest received for several years.

(Continued from page 225.)

MASSACHUSETTS MUTUAL LIFE INSURANCE COMPANY, SPRINGFIELD, MASS.

The fifty-second annual report of the Directors of the Massachusetts Mutual Life Insurance Company records the transactions of another prosperous year. The new business secured was ample in amount and of excellent character; and the total outstanding insurance shows a notable increase over the previous year. The gross assets of the company on December 31, 1903, amount to the great sum of $33,590,999. The surplus of the company was shown to be $2,647,491. The reserve, according to the Massachusetts standard, was $30,314,692.

The new policies issued represented risks assumed amounting to $24,317,223, and the total insurance in force on the 31st of December was $169,668,456—a gain of $10,964,654. The premium receipts were $6,136,254, a gain of $408,565, and the receipts from interest and rents were $1,394,497, an increase of $159,064.

There was paid to policyholders or to beneficiaries, for death and endowment claims, dividends and cash surrender values $3,348,047, an increase of $364.991.

John A. Hall is President of the company.

The Independent

VOL. LVI NEW YORK, THURSDAY, FEBRUARY 4, 1904 NO. 2879

Survey of the World

The Field of Politics

Mr. Bryan's demand for a reaffirmation of the Democratic currency platforms of 1896 and 1900 has not been favorably received by a majority of his party. At present it does not appear that he will be able to control on that issue even one-third of the delegates in the July convention. A canvass of Democratic Senators and Representatives in Congress shows 162 against reaffirmation, 7 in favor of it, and 42 who are non-committal. State Legislatures in the South are almost unanimous in the negative. Prominent Democrats who have supported Mr. Bryan continuously in the past, now say that while they are still faithful to his silver doctrine, they think it should not be made an issue this year. Leading politicians of the party in New York permit the publication of their conviction that overwhelming defeat awaits them if he induces the convention to accept his views. Mr. Williams, Democratic leader in the House, when asked, on the 26th ult., in the course of debate, whether he wished to return to "sixteen to one," replied that he believed his party had been right in 1896 and 1900, but conditions had since changed. Great deposits of gold had been discovered, and Providence had solved the problem. "The silver question," said he, "has been relegated to the rear, and now exists only in memory."—In New York, on the evening of the 26th ult., Mr. Bryan spoke for two hours to a crowded house on "The Moral Issue." He had invited the clergymen of the city to attend, and more than one hundred of them were present. The address was of a political character. Mr. Bryan protested against the influence of money and commercialism in politics and upon questions of national policy, denouncing corruption at the ballot box, in municipal councils and in Legislatures. Incidentally he asserted that his party in 1892 had collected from corporations a campaign fund of more than $1,000,000 (one Trust giving $175,000), and that the result was "the most plutocratic Government the country has ever known." A part of his speech was upon bimetallism and the proposed reaffirmation of the old platforms. "If we are to have bimetallism at all," said he, "what other ratio is there than the present one that is seriously supported?" On the following day he said that he did not regard the currency question as the issue of supreme importance at present:

> "There is a broader and more pressing issue. I have believed, since the campaign of 1900, that the great question is: Shall the money-changers rule the United States? That question includes all the issues—the currency, labor, Trusts and the rest. Free silver is only one of the relief measures."

When Mr. Cleveland was asked to comment upon Mr. Bryan's attitude, he made only this brief remark: "He's got the stage; let him go it."—Reports published by journals that oppose the nomination of Mr. Roosevelt indicate that the movement in support of Mr. Hanna is more persistent in Indiana than elsewhere. Senator Platt, of New York, says, however, that the delegates from Indiana, Illinois and Ohio will be instructed for Mr. Roosevelt; also those from New York, if he has "anything to say about it."—The controversy over the post office at Indianola, Miss., appears to have been settled by the appointment of W. B. Martin, a white man and a Democrat, who was the bondsman and has been the

firm friend of Mrs. Cox, the negro postmaster, who was virtually driven from the office by the white people of the town. Mrs. Cox's term has expired. She positively refused to accept a reappointment, and asked that the place be given to Mr. Martin. The office, closed some months ago, will now be opened.—Hostilities between the Republican factions in Delaware have been resumed. Mr. Addicks intends to be elected Senator to succeed Senator Ball, who now predicts that there will be two contesting delegations at the Republican national convention.—At the annual dinner, in New York, last Friday evening, of the Pilgrims, an association designed to promote Anglo-American friendship, an Atlantic cable was leased for a time, in order that there should be quick communication with the British Pilgrims, who were dining in London. Pleasant messages of esteem and congratulation were interchanged by Bishop Potter and Lord Roberts, Ambassador Durand and Ambassador Choate, Lord Beresford and Admiral Rodgers, General Nicholson and General Corbin, and other representatives of the two associations.

Important Projects of Legislation

A short bill, but one of great importance in the field of Trust legislation, was introduced in the Senate on the 29th ult. by Mr. Foraker, and referred to the committee of which Senator Elkins is chairman. It provides that nothing in the Interstate Commerce law of 1887, or in the Sherman Anti-Trust law of 1890, or in any law amendatory of either of these

"—shall hereafter apply to foreign commerce, or shall prohibit any act or any contract in restraint of trade or commerce among the several States, *provided that such restraint be reasonable;* or shall hereafter authorize imprisonment or forfeiture of property as punishment for any violation of such Acts, except for perjury or contempt of court."

Some say that this proposed modification of the Sherman law would leave no ground for such suits as the one against the Northern Securities merger. Mr. Foraker asserts that his purpose is so to change that law that it shall represent the real intent of the authors of it and of the Congress that enacted it. Newspapers of the Opposition insist upon associating the introduction of the bill with the presence in Washington last week of Mr. J. Pierpont Morgan, Mr. Cassatt, President of the Pennsylvania Railroad Company, Mr. Stillman, President of the National City Bank (in which Standard Oil interests are prominent), and Mr. Frick, of the Steel Corporation.—Mr. Sulloway, chairman of the House Committee on Invalid Pensions, has introduced a bill granting pensions for service only, and the prediction is confidently made that it will be passed. It grants pensions to all surviving Union soldiers of the Civil War who were in the service for ninety days and are 62 years old, at the rate of $8 per month; at the age of 66 years the rate becomes $10; at 70 years it is to be $12. Pensioners now receiving less than these rates have their allowances correspondingly increased; the rate for widows is increased to $12, and $2 is added for soldiers who served two years or more. Estimates of annual cost range between $15,000,000 and $60,000,000. According to the calculations made some years ago by Colonel Ainsworth, of the War Department, the cost would be about $60,000,000 at the present time and would decline to $44,000,000 in 1910. Reports that the President approves the bill have not been confirmed by evidence.—The House bill for the Navy will carry a large appropriation. Secretary Moody suggests the construction of one battle ship, one armored cruiser, three protected cruisers and four fast scout cruisers. The Department plans to spend ultimately $12,000,000 upon the naval station at Guantanamo Bay, and $9,000,000 for a similar station at Subig Bay, near Manila. It is also proposed that $1,500,000 be spent for a fortified coaling station on Kiska, one of the Aleutian islands.—In connection with the Northwestern land frauds eleven persons who testified at the trial in Oregon of A. B. Thompson (recently acquitted) have been arrested for perjury and for frauds like those for which he was indicted. The investigation concerning land frauds in Louisiana has yielded 350 indictments. Among those so accused last week were James L. Bradford, Gen. George Baldey and Francis Lory, Jr., prominent lawyers who have held Federal and State offices.

The Panama Controversy

There was an interesting debate in the Senate last week upon a resolution of inquiry prepared by the Democratic caucus and introduced by Mr. Culberson. This resolution, in its original form, asked the President whether all the official correspondence concerning the Hay-Herran treaty, the revolution in Panama, and the new canal treaty now pending, had been sent to the Senate; if not, the President was required to send all that had been withheld. The usual phrase, " if, in his judgment, not incompatible with the public interests," was intentionally omitted. The Republicans insisted that it should be inserted. After two days' debate, it was added to the resolution by a vote of 39 to 20, and the resolution thus amended was adopted without opposition. During the discussion, Mr. Spooner contended that the Senate had no right to demand the submission of executive correspondence by the President, who, he said, should be addressed courteously. Not a scrap of paper, Mr. Spooner believed, would be withheld, because the Government had nothing to conceal; but the President had a right to use his discretion concerning diplomatic correspondence, which might contain something offensive to other Powers. Mr. Cullom remarked that the Democrats were merely seeking partisan advantage. On the other hand, the supporters of the resolution argued that it was within the rights of the Senate, altho one of them admitted that there would be no remedy if the President should decline to send any of the papers. Mr. Aldrich suggested that the resolution should exclude papers relating to negotiations which might be in progress, designed to satisfy Colombia. Whereupon Mr. Gorman said he was delighted to hear that such negotiations had been or might be undertaken.—Mr. Stone introduced a resolution providing for an investigation of published charges that M. Bunau-Varilla and others in this country had promoted the revolution and had obtained official information as to the course which our Government would pursue. He intimated that he would vote for ratification of the treaty, but under protest unless these charges were cleared away. Mr. Bacon spoke in support of his resolution for a treaty to adjust our differences with Colombia, or for a submission of these differences to arbitration, so far as they related to the treaty of 1846. He had heard, he said, that Colombia would be satisfied if we should spend $10,000,000 in making a railroad from the canal to Bogota. —Mr. Simmons was the first Democrat to announce an intention to vote for ratification. He could not, he said, reconcile all of the President's acts with his own notions of right and law. The President's course, he thought, " was, to say the least, hasty, rash, improvident and dangerous to the peace and welfare of this country." He was not defending that course.

" What has been done in Panama has been done and cannot be undone. It was not done by the Democratic party, nor could that party have prevented it; and therefore it is in no way responsible for its doing. If what has been done in Panama can be undone at all by this Government, it can only be undone by doing a greater wrong to Panama than has already been done to Colombia. The defeat of this treaty will neither undo nor remedy that wrong."

Replying to a request from a business association in Texas that they vote for the treaty, Senators Bailey and Culberson say that they cannot do so.—A memorial representing conservative opposition to the treaty and the action of the Government, signed by a considerable number of Yale professors and other prominent residents of New Haven, has been presented by Senator Hoar. On the same day, Senator O. H. Platt presented another memorial, in which thirty Yale professors and fifty other prominent citizens of New Haven, including the President of the New York & New Haven Railroad Company, uphold Mr. Roosevelt's course and ask for ratification of the treaty.—At a public meeting of the Aldine Association, in New York, the Rev. Dr. Newman Smyth attacked the course of the Government, asserting that we had acted as a lawless Power. General A. C. Barnes described and commended the Mandingo Canal route, asserting that it was better than the one between Panama and Colon, and

that a canal there would cost only $100,000,000. This is the route where a tunnel 5½ miles long and 166 feet high, through the solid rock, would be required.

On the Isthmus

In the Panama Constitutional Convention a clause proposed by Dr. Amador, authorizing the United States to intervene for the restoration of peace and order, if these should be disturbed, was the subject of bitter debate, and was adopted by only a bare majority. It was denounced at public meetings. Clauses have been passed which prohibit gambling (now authorized by concessions), provide that $8,000,000 of the canal money shall be laid aside for the future benefit of the republic, and validate all acts of the Junta, including the ratification of the Canal treaty. After a heated discussion the following clause concerning religion was approved:

"The profession of all religions, as also the exercise of all forms of worship, shall be free, without other limitations than respect for Christian morality and public order. Nevertheless, it is recognized that the Catholic religion is that of a majority of the inhabitants of the Republic, and the law will provide assistance toward the founding of a seminary in the capital and missions for savage tribes."

Ministers of religion are exempted from charges for and employment in the public service, civil or military.—The unfriendly Indians of the San Blas coast, resenting the presence of the gunboat "Bancroft" in adjacent waters, set out in the night, on the 26th ult., to surprise and capture her, 200 of them approaching in 20 canoes. The searchlight and a rain of bullets from a rapid-fire gun, so aimed that it would do them no harm, sent them back to the shore. A large delegation of friendly Indians from Darien recently visited Panama to complain, but were speedily conciliated by a banquet.—Reports from Bogota say that the Government, having been assured by General Reyes that the United States will at present protect only the canal and railway zone, has decided to invade the Isthmus. This decision is regarded by some, however, as designed merely to prevent the overthrow of the Marroquin Government, which has lost popular support. At the State Department in Washington it is said that if General Reyes gave such assurance he did not rightly understand the attitude of our Government, which has not changed since notice was given that no troops with hostile intent would be permitted to enter the territory of the Republic. Joaquin Velez is said to be now the foremost candidate for the Presidency, General Reyes having lost a considerable part of his following. The local Government of Bolivar, where General Reyes has much popularity, is at variance with the central Government, which is assisting Velez.

Explosion in a Coal Mine

An explosion, causing great loss of life, occurred on the morning of the 25th ult. in the Harwick mine of the Allegheny Coal Company, at Cheswick, near Pittsburg. The usual inspection was made at 5:30; at 6 the day workmen went into the mine; at 8 o'clock an explosion of great force blew the cage out of the shaft, wrecked the buildings at the entrance, and killed two boys who were at work there. In the mine 180 men had been at work. All of them, one excepted, were killed. It was ascertained on the following day that death must have come instantly. By the terrible force of the explosion of gas their bodies had been driven through the dark passages and shockingly mangled. At the mouth of the shaft, where hundreds of their bereaved relatives anxiously waited for many hours in the bitter cold, there was scarcely any smoke or other sign of the terrible accident that had taken place. There were brave men who volunteered to go down into the gas-choked galleries. One of these was Selwyn M. Taylor, a wealthy mining engineer, known far and wide. He was one of the first to go down, and while looking for the miners, hoping that they could be saved, he was killed by the gas. His yacht was waiting for him, off the Florida coast, and he had intended to go South with his wife on the following day. Another volunteer, David Lysle, who came from a neighboring mine, lost his life while searching for the dead. All the rescuing parties were in great danger, because a long time passed before the air could be purified.

Only one miner was brought up alive. Among the dead was an unknown stranger. The number of those killed, including Taylor and Lysle, was 184, and not more than half the bodies could be identified. There had been gas in the mine, and it is thought that the explosion was caused by defective tamping for a blast. In the little mining village there are now more than 100 widows and four times as many orphans.

The Islands Governor Taft arrived in Washington on the 27th ult., and was escorted to the War Department Building by a troop of cavalry. He thinks the military force in the Philippines can safely be reduced to 10,000 men. This week he begins his term of service as head of the War Department.—It appears that Lieutenant Campbell W. Flake, who was killed near Cotta, in the Lake Lanao district of Mindanao, was shot by treacherous Moros while he was engaged in a conference with their leaders. The capture of Cotta by assault immediately followed his death. Twenty Moros were killed.—At Manila, General Lucban, the instigator of atrocities in Samar, has been arrested upon a charge of conspiracy.—The American capitalists who obtained the street railway franchise in Manila, intend to invest $4,000,000 in a trolley system, and to use 40 miles of track.—Alonzo R. Cruzen, formerly Collector of Customs at San Juan, Porto Rico, sailed from that port last week for the States. Remarks made in conversation indicated his purpose to begin a campaign in Nebraska as a candidate for the United States Senate. Mr. Cruzen's resignation, which is said to have been a result of the investigation of the charges against military and naval officers for smuggling, was accepted in December. Replying to a resolution introduced in the Senate by Mr. Carmack, Secretary Shaw has declined to send to the Senate the report of a special agent of the Treasury concerning Collector Cruzen, saying that it is a confidential statement, the disclosure of which would be incompatible with public interests.—A beginning of work upon the projected electric railway from San Juan to Ponce has been thus far prevented by litigation concerning the bond required by the terms of the franchise.

British Army Reform The War Office Reconstitution Committee, appointed three months ago, has made its report and its recommendations will be put into effect very soon, perhaps even without waiting for the approval of Parliament. The most important changes are the abolition of the office of Commander-in-Chief, now held by Lord Roberts, and the substitution of an Army Council or General Staff on the plan of the German military organization, which has also recently been adopted in this country. There are three divisions, a defense council, an army council and an inspector-general. The duty of the last is to examine and report on the efficiency of the military forces. The object of the changes is to decentralize the command by placing the Army Council under the direct authority of the civilian Secretary of State for War, divorcing the administrative from the executive department, and making the individual members responsible for different branches of the service. A very important feature of the report, tho not made prominent, is the admission to the permanent Defense Committee of representatives of the colonies, such as Sir Frederick Borden, the Canadian Minister of Militia. The report states that the inefficiency of the War Office, so clearly shown in the South African campaign, is due to the fact that it "has no thinking department." Emphasis is laid on the following recommendation:

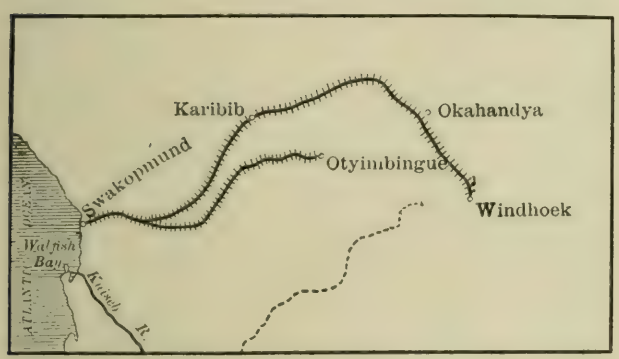
"New measures demand new men. We therefore attach special importance to the appointment of military members not hitherto closely connected with existing methods, and who, therefore, are not likely to be embarrassed by the traditions of a system which is to be radically changed."

Macedonia The scheme for reform in the administration of Macedonia as dictated by the joint Powers, Russia and Austria-Hungary, has been accepted by the Porte, and the first steps have been taken to put it in operation. This provides for the appointment of an Italian general to reorganize the

gendarmerie, and permit the Powers to send civil agents through the country to question the inhabitants as to their grievances and wishes. The inhabitants of the destroyed villages are to be exempt from taxation for one year; amnesty to be granted to all concerned in the recent troubles except those guilty of dynamite outrages and attacks on railways, and neither race nor religion to be a barrier to official employment. Lieutenant-General Emilio de Giorgis, an Italian officer of distinction, who is 60 years old and has been twice on the General Staff, has been selected to command the new *gendarmerie.* A proclamation of general amnesty to the Bulgarian and Macedonian revolutionists has been issued by the Sultan, but will not go into effect until the Porte is assured that there will be no repetition of the outbreaks and that Bulgaria will cease to interfere. No such assurance can, however, be given, since the leaders of the revolution, Sarafoff and Guerjicoff, declare that Turkish rule is preferable to Austrian or Russian control, because under the former they may easier reach their goal of Macedonian independence. A revolt is proclaimed for March 28, and already Bulgarian soldiers are reported to be crossing the frontier. Seven battalions of Turkish troops have been ordered to Monastir. At a secret session of the Bulgarian Sobranye an extraordinary credit of $5,000,000 was voted to the Government for an unknown military purpose.

Japan and Russia

Exactly what has been doing in Russia during the past week is not known, nor will it ever be unless Russian statesmen are like their French allies in their fondness for publishing memoirs posthumously. No reply has yet been returned to the last Russian note, and the reason for the delay is not disclosed, altho the facts that the Empress of Russia is in a critical condition of health and the Viceroy Alexieff has been confined to his room by illness have been alleged as explanations. Russia repudiates the suggestion that there is anything offensive to her in the recent action of the United States opening the Manchurian ports of Mukden and Antung. The Korean Cabinet is now friendly to Japan, and it is reported that the Korean port of Wiju on the Yalu River will be opened.—The Japanese naval preparations actively continue. Twenty-eight transports and 35 war ships are lying at Saseho and 40 transports at Tsushima, already filled with troops ready for the invasion of Korea, according to some correspondents. The military authorities have taken possession of the Japanese railroad running from Fusan on the coast to Seoul, the capital, and large numbers of Japanese laborers have been transported for work there. These could be easily converted into soldiers whenever needed. There have been some riots in Korea, but of no great importance.—The Russian military strength in Siberia and Manchuria, east of Lake Baikal, consists of 3,115 officers, 147,479 men and 266 guns, including the railway guard. The infantry number 2,100 officers and 105,829 men; each regiment with one company of mounted infantry. There are 188 squadrons of cavalry with 603 officers and 21,914 men, 87 squadrons of these being Trans-Baikal Cossacks. The artillery consist of 36 batteries, each composed of six officers and 242 men with six to eight guns. The engineers comprise 22 companies, with 88 officers and 3,745 men, including two submarine mining companies and a balloon section. The transport division is composed of 60 officers and 5,423 men. Four armored cruisers are at Vladivostok and all the rest of the fleet at Port Arthur.



The Herero Outbreak

At the last report from Lieutenant Zülow, sent by messenger to Karibib, January 21st, he is still holding Okahandja with a force of 200 men. An attempt was made to raise the siege by a small corps with a machine gun from Windhoek, but it was repulsed with loss, and the capital itself is surrounded by several thousand natives and in danger of falling into their hands. It is reported that the Kaffirs have joined the Hereros, and so over 20,000 men are in arms against the whites. Families caught on the farms have been horribly slain, and captured soldiers are tortured and buried alive. The German gunboat "Habicht" was sent from Cape Town and has gone as far as possible up the Swakop River.

The Reichstag passed the supplementary credits asked for by the Government to send troops, altho Herr Bebel declared the Hereros are, like the ancient Germans, defending their soil against the Romans.

German Southwest Africa

In the great African land-grab of twenty years ago Damaraland fell to the Germans chiefly because no other country had thought it worth while to lay hold of it. In the extreme aridity of its climate, due to the off-shore winds, it differs decidedly from Southeast Africa, and for ten miles back from the coast it is barren sand. Beyond this there is a belt of rocky highlands or steppes, some forty to fifty miles wide, and then mountains ranging from 3,000 to 7,000 feet above the sea level. Most of the country will never be used for anything except grazing, as it is now, altho there are numerous fertile valleys hidden in the mountains which will support a considerable population, and other districts can be brought under cultivation by irrigation. Since the settlers are necessarily isolated in these areas of arable land and cattle ranches, they are always, like the early inhabitants of our Western States, in danger from the attacks of the natives, to whom a chance of driving off cattle and ravaging a ranch is too strong a temptation to be long resisted. It was Bismarck who saw the possible importance of this region, the largest on the coast left unclaimed at the time, and in 1884 he extended the protection of the German Empire to Lüderitz, a Bremen merchant, who, the year before, had purchased from the natives 215 square miles near Angra Pequeña. Later the German interests were extended northward, altho the British held the only good harbor there, Walfish Bay, and 430 square miles of the vicinage just south of the Swakop River. Just north of this the Germans constructed the artificial harbor of Swakopmund, and in the last three years have constructed a railroad from this port to Karibib and Windhoek. The Government spends over $2,000,000 a year on this colony, and yet the white population is only about 4,000, two-thirds of them male, and not more than half of them Germans. Since the war a thousand or more Boers have trekked into it from the Transvaal. The area of German Southwest Africa exceeds that of Germany by one-half.

The Scene of the Herero War

The Hereros

The Hereros or Damaras, who have recently gone upon the warpath and massacred the settlers in German Southwest Africa, belong to the Bantu family, which extends over the larger part of Central Africa. The name "Hereros" is said, from philological reasons only, to mean "cheerful men." They are a purely pastoral people, with no settled villages and almost no property except the cattle they herd on the open range. Their food consists of milk and nuts, with the flesh of such of their animals which die a natural death or are killed on some festival occasions. Their bodies are smeared with grease and red ocher, and their clothing is made from skins. The boys are circumcised, and in both sexes on reaching puberty the upper front teeth are filed and lower front teeth are knocked out. In appearance they are nearer the Caucasian type than other South African negroes, for they have higher foreheads, longer noses and less protuberant lips. Tho warlike in their inclinations, they were not able to stand against the encroachments of the Hottentots on the south, who by 1850 had driven them into the extreme northern part of Damaraland, when Chief Kamaherero succeeded in turning the tide, and in 1865 successfully held Otyimbingue against four attacks of the Hottentots, who lost 1,500 men in the final assault. In insur-

ing peace and stability to his kingdom Kamaherero was greatly aided by German missionaries, and in 1885 granted to Germans the right to settle in his country and develop mines. This concession was revoked in 1888, when the settlers were forced to flee to the British port of Walfish Bay until they could be protected. In 1897 the Zwartburg Hottentots rose and attacked the cattlemen, but were dispersed by the German troops.

Anti-Alcoholic Crusade in France

The "First Anti-Alcoholic Congress of France" recently convened in Paris. It consisted of about five hundred representatives, men and women, including pastors and priests, officers in the army, university and lycée professors, judges, physicians and others from the leading and influential circles. Even the Social Democrats participated, with the pronounced purpose that they owed this to the welfare of the workingmen. The reasons for the inauguration of this new crusade against alcohol on a national scale are found in the data and facts which several of the addresses at the convention made prominent. Since the year 1871 there has been absolutely free license in France to sell intoxicants. As a consequence public houses have increased to such an alarming extent that there is now one such breeding place of intemperance for every 81 inhabitants, while in Germany there is only one to every 187, with Sweden and Norway representing the other extreme, the former with only one to every 5,000, and the latter one to every 9,000 souls. With the increase of saloons the percentage in the use of alcoholic beverages has also grown in France. In 1830 it was only 6.75 liters for each person, but in 1900 it was 13.71. Another factor that has developed drunkenness in France is the fact that the peasants have been permitted by the authorities to make as much intoxicating drink as they desired for their own use. It has been statistically demonstrated that more than one million small farmers have made use of this legal permission, called "*bouilleurs de crû.*" One of the consequences has been that the use of intoxicants has increased much more rapidly in the villages and country towns than in the large centers of population. In this way several of the best provinces, notably Normandy and Bretagne, have been headquarters of King Alcohol. Women and children drink as do the men, and an alcoholic drink has become to be a regular part of the breakfast. Thousands of peasants secretly sell the product of their stills to the city, and in this way have defrauded the Government of millions of revenues. The State has been afraid to attack the growing evil because the half million sellers of intoxicants wield tremendous political power that may endanger party power. Attempts have been made to have Parliament act, but on every occasion at least two hundred votes have promptly been cast against the abridgement of any of the saloon rights. It is this condition of affairs that has brought about the new movement independent of party or state authorities. It is particularly gratifying that the army officers are taking such a prominent part in the anti-alcoholic crusade, and it is largely through their influence that no liquors are allowed to be served in the barracks. None has been more prominent than General Galliani, now in Madagascar. Indeed, the propaganda has prospered more in the army abroad than at home. The different local societies that united in constituting this first national convention work according to different methods, some trying to work through local legal enactments, others through abstinence vows, others through the spread of literature, etc. They do not even all agree in demanding total abstinence. The strongest organization of this tendency is the "Society of the Blue Cross," which is a confederation of fully one thousand local temperance societies, with a total membership of fifty thousand. It has been found very difficult to enlist the co-operation of the Catholic priests, chiefly for the reason that the manufacture of the finest liqueurs in the country is in the hands of the cloisters and the monks, and the Church adds millions every year to its revenues from this source. This first convention had more of an educational purpose, a definite mode of procedure and a clearly outlined program having been left for future meetings to settle.

A Proposition for Christian Union

BY AMORY H. BRADFORD, D.D.

MODERATOR OF THE CONGREGATIONAL NATIONAL COUNCIL

IN many efforts for the unification of Christendom the mistake has been made of trying to unite those who are farthest apart, instead of those who are nearest together. There is most hope of success where there is least resistance. Therefore, union between Presbyterians, Congregationalists and Baptists seems to me comparatively easy of realization. The object of this article is to point out a few facts in support of this statement.

First consider the case as it lies between Congregationalists and Presbyterians. That there are, or appear to be, fundamental differences will not be doubted. The Presbyterian polity represents authority outside the local church; the Congregational insists on the autonomy of the local church. These principles seem to be antagonistic and yet the differences are not as wide as they seem. Congregationalism stands for government of the local church by the local church, whereas Presbyterianism recognizes the local church in its representative assemblies. The latter polity is not one in which the local church is neglected, but one in which it has full and fair representation. It is not without a large element of independency. Moreover, in its practical working, that communion has been steadily growing toward a distinct recognition of the rightful liberty of the local congregations. The Church courts still have a semblance of authority over them, but little more than a semblance. Individual churches call their own ministers and manage their own business as they like, and would give short shrift to any dictatorial spirit in Synod or Assembly. Authority over the weaker churches continues because it is exercised in so mild a form; it is sometimes, tho seldom, asserted over influential congregations. There must be organization and co-operation for the administration of missions and benevolent enterprises, and no change is probable in the conduct of such work; but, as I study movements within the Presbyterian body, the tendency toward independence in regard to all matters of creed, and in regard to all that concerns the relation of the local church to the individual, seems to be increasingly left with the separate congregations.

When we turn from the Presbyterian to the Congregational body we find a similar gravitation. There is no tendency to diminish emphasis on the independence of the local church so far as it has to do with the statements of doctrine, tests of membership, ritual, etc. On the other hand, there is a decided movement toward Presbyterianizing the body for the administration of its benevolent and missionary enterprises. Presbyterianism stands for Puritanism of the Scotch type; Congregationalism stands for Puritanism of the English type. There was a time when those differences were more distinctly accentuated than now. At the beginning of the Puritan Revolution the Presbyterians declared for the union of the Church and State, but that heresy went down before the sword of Cromwell. It still has a formal sort of recognition in Scotland; but nowhere else, that I remember, is the Presbyterian community in alliance with the State.

What changes would be needed in order that there might be union between the Presbyterian and Congregational bodies?

No change in doctrinal statements would be required. The Presbyterians would need only to leave questions concerning creed, ritual, church membership to the local church, and then press on to perfect their organization for the extension and administration of missionary enterprises. Congregationalists, on the other hand, while retaining their historic independence, would have only to recognize that there must be wide co-operation if they are best to accomplish the best results for the Kingdom. Thus the Presbyterian principle would prevail in all aggressive work, and the Congregational in all that concerns the local church. In

short, both bodies would have only to anticipate the end toward which they are swiftly and inevitably tending.

Of course, on both sides many would repudiate these suggestions as impracticable, but I cannot think that the day is far distant when those who are as near to one another as the Presbyterians and Congregationalists surely are will recognize that they belong together. If the ecclesiastical leaders were as anxious for unity as the rank and file of the people it would not be difficult to reach an understanding. There is no shorter step in Church unity than that over the narrow chasm which now divides these two great denominations. If each would make a slight concession, which would not involve a question of moral principle, the scandal of many churches where only a few are needed, especially where those churches stand for the same traditions and truths, would no more disgrace the Christian name.

The division between the Congregational and Baptist bodies ought to be closed still more easily. All Baptists are Congregationalists. Both communions have fought for the same principles and have essentially the same history. All that separates them concerns the subjects of baptism and the method of baptism. On what basis could this division be healed?

My proposition is very simple. Let them unite on the basis of the individual conscience. At present the mode of baptism and the subjects of baptism are made a denominational issue. Why not leave both questions to be settled by individuals? Those who believe in immersion should be immersed; those who believe in sprinkling should be sprinkled. Parents who believe that the New Testament authorizes baptism of children should have their children baptized. On this basis no one would give up anything. We would simply cease to impose the collective conscience on the individual conscience. In the church of which I am the pastor there is a baptistery, which is frequently used by those who prefer immersion to sprinkling. The preference of the individual is always respected. Again, we baptize children where parents believe such a course to be sanctioned by the New Testament, and, on the other hand, we have a form for the Consecration of Children. The first infant presented for the reception of this rite was the child of a Baptist, who would never have been willing to have him baptized. In one church, at least, therefore, the preferences of the minority are respected and provided for. If Baptists would take exactly the same position unity would be accomplished. They would baptize by sprinkling where the individual conscience demands that; they would baptize children when parents conscientiously believe that to be the right course. In short, the responsibility for deciding all such questions would be placed on the individual conscience. Then all differences between the two denominations would disappear. I may be told that those differences are more deep-seated than I imagine. Possibly. But when I remember that a large proportion of the Baptist ministers of my acquaintance have already become open communionists, and when I also remember that most of the intelligent laymen whom I know have long practiced open communion, I cannot believe that the difficulty is as great as some may imagine. In the spring of 1903 President Day, of Syracuse University, who had been supplying the Central Baptist Church in that city, was unanimously invited by that church to conduct the communion service, and the invitation was accepted. Thus one more church abandoned the exclusive policy of the past. Not long ago at dinner in the home of one of the most distinguished Baptist educators in the United States fifteen ministers were at the table, fourteen of whom were Baptists and one a Congregationalist. This subject came up for consideration, when I ventured to suggest that all that separates the denominations should be left to the individual rather than be made an occasion for corporate action. Of the fourteen Baptist ministers present, and all were men of great prominence, thirteen agreed with me in the suggestion which I made. A year or two later I was at dinner in the home of a very eminent Baptist layman. Both clergymen and laymen were present. The question again came up, and this time there was no dissenting voice. I cannot believe that the difficulties in the

way of realizing the plan here suggested are insuperable. Some problems which have to do with the administration of institutions of learning and benevolent societies, of course, would require careful consideration.

It is possible that in all three denominations the question of name might be a hard one to settle, but surely a name, however dearly it may be loved, ought not to be allowed to prevent the taking of such a long step in the direction of Christian unity.

The effort to secure co-operation and unification should be along the lines where Providence has so clearly indicated that it ought to begin. Indeed, Providence is already slowly but surely forcing such a union. Individuals may hinder this movement, but they cannot long obstruct it. Presbyterians are already becoming Congregationalists so far as to insist on leaving to local churches all that concerns the local church, and Congregationalists are demanding more compact organization for benevolent work. Many of the more prominent Baptists, both in this country and abroad, are open communionists. I have myself received communion from Mr. Spurgeon, he knowing that I was a Congregational minister.

What recommendations do I make as to union between Baptists and Congregationalists? Simply this: Let the Baptists decide to do what is already a common practice in at least one Congregational church, baptize with little water those who believe in that system and with much water those who prefer the more. And let them leave to parents to decide as to the baptism of infants. Let Congregationalists be willing to immerse those who prefer immersion, and cease to emphasize the importance of infant baptism, always insisting on the sanctity of the individual conviction. Indeed, no Congregational churches now insist on infant baptism. If a few representative churches would set the example of leaving the responsibility of deciding these matters where it belongs others would soon follow; and if those among the clergy and laity who already believe in the feasibility of this plan would publicly commit themselves to it, not in an aggressive or dictatorial way, but in a spirit of love, their influence would have immense weight.

The desirability of the unification of Christendom is hardly a subject for debate. It is urged in the interests of economy, of brotherhood, of Christian efficiency. It is feasible, and the greatest hope of its speedy realization is to be found in the way of the least resistance. It cannot be very long before Providence will force Presbyterians, Baptists and Congregationalists into closer relations. Would it not be well for those communions to anticipate what has already been so clearly indicated to be the part of wisdom, and thus prepare the way for union with others who are separated from them by principles no more sacred, and but slightly more difficult of adjustment?

MONTCLAIR, N J

The Cebu Diocese in Prospect

BY BISHOP THOMAS A. HENDRICK, D.D.

[Bishop Hendrick was appointed to the Catholic see of Cebu, Philippine Islands, last summer. Until then he had been pastor of a church in Rochester, N. Y. He visited Rome to be consecrated and to receive instructions for the rule of his diocese, and he is now on his way to San Francisco. He will sail for the Philippines about the middle of February.—EDITOR.]

IT is hard to get reliable figures concerning the population of the Philippines, but so far as I can estimate with the statistics at hand, the native clergy of the archipelago are far outnumbered by those of Spanish birth. In the diocese of Cebu there are, I understand, 300 priests. Out of this number, only about 75 or 100 are Filipinos. The work of a diocese of 1,745,000 souls, as Cebu is, cannot be carried on with so small a force of clergy as 75 or 100, and I shall endeavor to persuade the Spanish priests to stay in the diocese.

BISHOP THOMAS A. HENDRICK

The Cebu diocese consists of about 25 islands southeast of Luzon. Bishop Rooker's diocese—that of Jaro—is also the southern portion, with the difference that he has those islands to the west, while the diocese of Cebu includes those to the east. The island of Negros we divide between us.

The northern portion of Mindanao is included in the Cebu diocese. The rest of the island of Mindanao is occupied by Moros who are Mohammedans, among whom the Jesuits are laboring. This pioneer work of the Jesuits is a good example of what their order is trying to do in the Philippines. The Jesuits' function there, as I am told by their Father-General, is mainly missionary. They go out among the savages, and when they get a district fairly well settled they turn it over to the Benedictines, who have a different function. The Benedictines' work is rather to have continuous jurisdiction, to care for the people and to build them up. The Jesuits have colleges and the Observatory in Manila, the latter institution being under the direction of Father Algue, who is in charge of the Philippine exhibit at the Louisiana Purchase Exposition.

There are some Augustinians and Franciscans in the Cebu diocese, about 25 Jesuits and probably as many Benedictines, all of whom will stay in the diocese. The function of the religious will be largely to assist by means of colleges, missions and special work of a similar character. The various religious communities will be distributed according to the need in different parts of the diocese, by the same method as prevails in the United States. In one city in America, for instance, the Franciscans are well represented; in another, the Augustinians, and so on.

As far as I am concerned, my purpose

in the Philippines is simply to carry out the provisions laid down by Pope Leo XIII in the bull which he issued on the Philippines. Outside of this I have no policy, because I am not intimately enough acquainted with the conditions there. I presume that in a little while the bishops of the Philippines will hold a council, and methods and means of work will then be more definitely established.

Some Considerations of the Far Eastern Crisis

BY COLGATE BAKER

[Mr. Baker was born in Japan and has lived there many years. He has also had considerable military experience, having served for a long period in the United States Army. The following article is written, therefore, by one well qualified for the task. —EDITOR.]

IF Japan and Russia are left to fight it out by themselves, as the present complexion of the diplomatic situation would indicate, there is no question that the sooner the long threatened war begins the better for Japan. It is hard to imagine the spectacle of one country fighting the battles of another without the aid of the other, as Japan may have to in respect to China, yet even this anomaly may be presented to the world, altho Japan seems assured of some material aid from China, and even the active co-operation of the Chinese populace in the theater of war would be of immense advantage to the Mikado's forces.

For many years preparations for a war with Russia have been going on in Japan, and to-day Japan stands ready to strike. It must also be admitted that Japan has every chance of defeating Russia, both on sea and land, in the Far East at the present moment.

In the first place, every strategic advantage is with Japan. The bases of the Japanese army and navy are adjacent to the scene of conflict, and she can operate on "interior lines," both by sea and land. It is possible for Japan to bring a superior force against Russia at any point in the theater of war at the present moment. Vladivostok, the greatest Russian stronghold in the Far East, is now ice-bound, the troops stationed there are bottled up, and the ships in the harbor are fast in the ice. Until next spring, when the ice melts, Vladivostok and the Russian forces there may be eliminated from consideration by the Japanese. Prodigious efforts have been made by the Russian Government to establish a permanent military base at Port Arthur and make that place impregnable to attack. It may be taken for granted that Port Arthur has been magnificently fortified by the Russian engineers, and is to-day quite impregnable from any direct attack by sea or land, but the strategic position of Port Arthur on the map is very weak if Russia cannot maintain command of the sea. If the Japanese navy overwhelms the Russian fleet and secures for Japan the mastery of the sea, the Russian line of communication and supply for Port Arthur along the Liao Tung Peninsula is left open to attack by Japan, while the latter's own line of communication will not be in any way endangered. Such will be the predicament of Russia should Japan win a great naval victory.

That the first strategic objective of the Japanese war council will be the Russian fleet is an open secret, and having established their supremacy on the sea it is easy to guess that the next objective will be the destruction of the Russian lines of communication and supply overland to Port Arthur. This task will be intrusted to a Japanese army operating from a conveniently established military base on the Liao Tung Peninsula, while

the Japanese navy blockades Port Arthur and other Russian ports in the Far East.

The success of the Japanese military operations will largely depend on the celerity with which they are conducted and not a little by the disposition, sympathy and assistance of the Chinese. It would be a comparatively easy feat for a Japanese army corps to cut the Russian line of communications, but to prevent Russia from opening the line again in time to relieve Port Arthur means a long campaign in Manchuria. The prosecution of such a campaign in winter so as to win any decisive success is well-nigh impossible.

For months Russia has been rushing troops overland via the Siberian Railway and sending them in transports from the Black Sea to the Far East, in order that she may have a sufficient force in Manchuria with which to meet Japan. How many men Russia now has in the theater of war is a question. But the augmentation of her forces has proved to be a slow and tedious matter. The Siberian Railway, with its limited facilities, has been worked overtime for a year, and yet Russia, it is well known, has been unable to place all the troops she would like to have in the Far East.

It is quite certain that the Japanese war council, through the army of Japanese spies which has been infesting Manchuria and Siberia, is well aware of the numerical strength of the Russian forces in the Far East, and the Japanese army of invasion sent to Manchuria will be large enough for the work in hand. Japan has also undoubtedly carefully calculated the rate at which Russian reinforcements may be expected to arrive overland, and in her plan of campaign these things have been taken into consideration.

The Japanese army on a war footing numbers about 500,000 effectives, but in any war with Russia every able-bodied Japanese man may be considered a soldier, and it is not unlikely that Japan will have to use every available man. Korea must be occupied and probably defended by a large army; Manchuria must be invaded by another of sufficient strength to match the Russian forces; Port Arthur, Newchwang and possibly other Russian strongholds will have to be invested, and then there remains the necessity of leaving an army for home defense and for the garrisoning of Formosa.

It is evident that in any prolonged war with Russia, Japan will have to strain her military resources to the utmost, and even then, if she is unable to win some decisive victories in Manchuria, the day will come when Russia will have an overwhelming preponderance of force there. The winning of some decisive victories in Manchuria and the capitulation of Port Arthur and perhaps some of the other Russian posts are probably just what the Japanese war council counts on.

In the campaigning over Manchuria's desolate plains Japan again has the advantage over Russia. The Japanese soldier, who is able to live on a meager diet of tea and rice and yet retain his fighting and marching vigor, is a better type to withstand the hardships of such work than the Russian. Military experts agree that the Japanese soldier is a marvel of endurance, both physical and mental. It may almost be said that the Japanese soldier is born a veteran. He is certainly born with that philosophy and stoicism which in Europeans only comes with experience. The old soldiers of the regular armies of Europe and America acquire such qualities, but the Japanese has them by inheritance from generations of the fiercest stoics the world has ever seen, the "samurai" of old Japan, and by training. It is quality and stamina such as the Japanese soldier possesses that count in a campaign such as this will be.

In maneuvering the Japanese columns should have another advantage over the Russian because of the ability of the Jap infantryman to carry as much as ten days' rations in his haversack and cut loose from his base of supplies when necessary. Swift-moving, self-sustaining columns of Japanese would give the Russian generals no end of trouble, in spite of the famous Cossacks.

As to cavalry, Russia is far superior to Japan, and in the use of cavalry lies the greatest hope of Russian victory. The Japanese is an inferior horseman and the mounts of the cavalry are weakling Arab half-breds. The Jap cavalryman is no match for the Cossack or the Russian, except as a swordsman.

However, the weakness in the cavalry arm is more than offset by a superior efficiency in the infantry and in the service of all the Japanese staff departments, particularly in the commissary and transport. The Russian artillery service and that of the Japanese are equally efficient, but the Russian field and light batteries are probably better horsed.

In marksmanship there is little to choose between the Russian soldier and the Japanese—both are wretched military shots; the Cossack probably is the worst of all. Strenuous efforts have been made to raise the standard of marksmanship in the Japanese army, but the prevalence of defective vision among the soldiers has proved too great an obstacle to overcome. A large percentage of men in the Japanese infantry have been provided with eye-glasses, but satisfactory results have not been obtained on the target range or in the field. The practice of the Japanese artillery, however, is excellent.

That the Japanese soldier is animated by the most intense patriotism, verging almost to the point of fanaticism in the ardor of his devotion to Mikado and country, every one familiar with Japan knows. Victory or death for the Mikado will be the motto of every man in the Japanese army and navy. The Russian soldier is brave and patriotic, but not in the same spirit or the same degree of intensity as the Japanese. The Russian soldier is generally a conscript, while the Japanese is an enthusiastic volunteer. The Russian private is ignorant, slow witted, and his feelings toward his commissioned officer combine respect, fear and dislike. The Japanese private reverences, admires and loves his superior officer, who sets him a fine example of courage, patience and restraint.

The Russian officers and soldiers have an unwise contempt for the prowess of the Japanese soldiers. The men of the Russian army, mostly ignorant peasants, have been told by their officers that the Japanese are a "race of monkeys," of whom they need not feel the slightest fear in battle. The result of this kind of talk has been to encourage a swaggering over-confidence among the Russian rank and file as to the outcome of any fighting with the Japanese. These Russian illusions will be quickly dispelled when the Jap meets the Russian in battle. As a matter of fact, the Japanese soldier of to-day, descended from the old-time "samurai," is one of the most dangerous and fiercest fighting men the world has ever seen; every one who has seen him fight in recent years will bear testimony to this.

In considering a Russian-Japanese war one must come to the inevitable conclusion that the end of the war must result in compromise. Even tho Japan is victorious on sea and land, as she has every right to expect to be, she must eventually retire from Manchuria in the face of an overwhelming Russian army. The result would be a compromise. Why not compromise now, without fighting, one may well ask, and the answer is that the Japanese hope to turn the Chinese into soldiers and raise a Chinese army big enough to keep Russia at bay. The question is, "Can they do it?"

NEW YORK CITY.

A Prairie Flower

BY EDMUND KEMPER BROADUS

FULL many a flower the prairies bear,
Blue and yellow and white and red,
Daisy, larkspur, buttercup fair,
Honey-pressed blooms where bees are fed.

But fairest meed of the prairie quest—
Sun-kissed ringlets and dancing eyes—
Blossoms a flower—mayhap you've guessed
Where father and mother botanize.

VERMILION, SOUTH DAKOTA.

The Wright Machine Gliding High in the Air

The Experiments of a Flying Man

BY WILBUR WRIGHT

[Recently scientists and the public generally were surprised to read a report in the daily papers that the air had been successfully navigated by a device which covered a distance of about three miles without the aid of a balloon attachment. While the distance was somewhat exaggerated it was demonstrated that the flying machine had actually gone over a half mile before accidentally touching the ground; the operator then continued his flight for some distance further. The inventors of the new type of air ship are Messrs. Wilbur and Orville Wright, two engineers of Dayton, Ohio, who have been carrying on experiments on the Atlantic Coast in North Carolina for the last three years. The Messrs. Wright have been following plans which differ considerably from those of Langley and other notable navigators of the air. Many of their experiments have been witnessed by eminent scientists, among them Professor Octave Chanute, of Chicago. The earlier experiments which have so successfully culminated were included in the report made by the Messrs. Wright to the Western Society of Engineers, of Chicago.—EDITOR.]

THE person who merely watches the flight of a bird gathers the impression that the bird has nothing to think of but the flappings of its wings. As a matter of fact, this is a very small part of its mental labor. If I take a piece of paper, and after placing it parallel with the ground, quickly let it fall, it will not settle steadily down as a staid, sensible piece of paper ought to do, but it insists on contravening every recognized rule of decorum, turning over and over, darting hither and thither in the most erratic manner, much after the style of an untrained horse. Yet this is the style of steed that men must learn to manage before flying can become an everyday sport. The bird has learned the art of equilibrium, and learned it so thoroughly that its skill is not apparent to our sight. We only learn to appreciate it when we try to imitate it.

Lilienthal's experiments in balancing began where others left off, and thus saved the many thousands of dollars that it had been customary to spend in building and fitting expensive engines to machines, which were uncontrollable when tried. He built a pair of wings of a size suitable to sustain his own weight, and made use of gravity as his motor. This motor not only cost him nothing to begin with, but it required no expensive fuel while in operation, and never had to be sent to the shop for repairs. It had one serious drawback, however, in that it always insisted on fixing the conditions under which it would work. These were that the man should first betake himself and the machine to the top of a hill and fly with a downward as well as a forward motion. Unless these conditions were complied with, gravity served no better than a balky horse—it would not work at all. Altho Lilienthal must have thought the conditions were rather hard, he, nevertheless, accepted them until something better should turn up; and in this manner he made some two thousand flights, in a few cases landing at a point more than a thousand feet distant from his place of starting.

Other men, no doubt, long before had thought of trying such a plan. Lilienthal not only thought, but acted, and in so doing probably made the greatest contribution to the solution of the flying problem that has ever been made by any one man. He demonstrated the feasibility of actual practice in the air, without which success is impossible.

From this I was led to read more modern works, and as my brother soon became equally interested with myself, we passed from the reading to the thinking, and finally to the working stage. The wonder was not that he had done so little, but that he had accomplished so much. It would not be considered at all safe for a bicycle rider to attempt to ride through a crowded city street after only five hours of practice, spread out in bits of ten seconds each over a period of five years, yet Lilienthal with this brief practice was remarkably successful in meeting the fluctuations and eddies of wind gusts. We thought that if some method could be found by which it would be possible to practice by the hour instead of by the second, there would be hope of advancing.

We found, according to the accepted tables of air pressures on curved surfaces, that a machine spreading 200 square feet of wing surface would be sufficient for our purpose, and that places could easily be found along the Atlantic Coast, where winds of 16 to 25 miles were not at all uncommon. Our next work was to draw up the plans for a suitable machine. After much study we finally concluded that tails were a source of trouble rather than of assistance, and therefore we decided to dispense with them altogether. It seemed reasonable that if the body of the operator could be placed in a horizontal position instead of the upright, as in the machines of Lilienthal, Pilcher and Chanute, the wind resistance could be very materially reduced, since only one square foot instead of five would be exposed. As a full half horse-power could be saved by this change, we finally arranged to try at least the horizontal position.

We began our experiments on the Atlantic Coast at Kitty Hawk, N. C., in 1900, trying the machine as a kite. The results were very satisfactory, yet we were all well aware that this method of testing is never wholly convincing until the results were confirmed by actual gliding experience.

Our attention was next turned to gliding; but no hill suitable for the purpose could be found near our camp at Kitty Hawk. This compelled us to take the machine to a point four miles south, where the Kill Devil sand hill rises from the flat sand to a hight of more than 100 feet. Its main slope is toward the northeast and has an inclination of 10 degrees. On the day of our arrival the wind blew about 25 miles an hour, and as we had had no experience at all in gliding, we deemed it unsafe to attempt to leave the ground. But on the day following, the wind having subsided to 14 miles per hour, we made about a dozen glides. It had been the original intention that the operator should run with the ma-

Lilienthal Sailing in His Machine Two Days Before His Death

chine to obtain initial velocity, and assume the horizontal position only after the machine was in free flight. When it came time to land he was to resume the upright position and light on his feet, after the style of previous gliding experimenters. But on actual trial we found it much better to employ the help of two assistants in starting, which the peculiar form of our machine enabled us readily to do, and in landing we found that it was entirely practicable to land while still reclining in a horizontal position upon the machine. Altho the landings were made while moving at speeds of more than 20 miles an hour, neither machine nor operator suffered any injury. The slope of the hill was 9.5 degrees, or a drop of 1 foot in 6. We found that after attaining a speed of about 25 or 30 miles, with reference to the wind, or 10 to 15 miles over the ground, the machine not only glided parallel to the slope of the hill, but greatly increased its speed, thus indicating its ability to glide on a somewhat less angle than 9.5 degrees, when we should feel it safe to rise higher from the surface. The control of the machine proved even better than we had dared to expect, responding quickly to the slightest motion of the rudder. With these glides our experiments for the year 1900 closed.

Our 1902 pattern was changed to a double-deck machine having two surfaces, each 32 feet from tip to tip and 5 feet from front to rear. The total area of the main surface was about 305 square feet. The front rudder spread 15 square feet additional and the vertical tail about 12 square feet, which was subsequently reduced to 6 square feet. The weight was 116½ pounds. Including the operator the total weight was from 250 to 260 pounds. It was built to withstand hard usage, and in nearly a thousand glides was injured but once. It repeatedly withstood without damage the immense strains arising from landing at full speed in a slight hollow, where only the tips of the wings touched the earth, the entire weight of the machine and operator being suspended between.

The practice ground at the Kill Devil hills consist of a level plain of bare sand, from which rises a group of detached hills or mounds formed of sand heaped up by the winds. The three which we used for gliding experiments are known as the Big Hill, the Little Hill and the West Hill, and have heights of 100 feet, 30 feet and 60 feet, respectively. In accordance with our custom of beginning operations with the greatest possible caution, we selected the Little Hill as the field of our first experiments, and began by flying the machine as a kite. The object of this was to determine whether or not it would be capable of soaring in a wind having an upward trend of a trifle over 7 degrees, which was the slope of the hill up which the current was flowing. On trial we found that the machine would soar on, the side of a hill having a slope of about 7 degrees whenever the wind was of proper force to keep the angle of incidence between 4 and 8 degrees. If the wind became too strong or too weak the ropes would incline to leeward.

The kite experiments having shown that it ought to be possible to glide on the 7-degree slope, we next proceeded to try it. Altho on this first day it was not considered advisable to venture upon any absolutely free flights, the machine soon demonstrated its ability to glide with this angle of descent. At a later period we made more than a hundred flights, the full length of this slope, and landed a short distance out on the level ground. On the second day the machine was taken to the Big Hill, and regular gliding was commenced. The wind was somewhat brisk. In one flight the wind struck the machine from the left and began lifting the left wing in a decidedly alarming manner. Owing to the fact that in the new machine changes had been made in the mechanisms operating the rudders, so that the movements were exactly reversed, it was necessary to think a moment before proceeding to make the proper adjustment. But meanwhile the left wing was rising higher and higher. I therefore decided to bring the machine to the ground as quickly as possible, but in my confusion forgot the change that had been made in the front rudder, and instinctive-

ly turned it the wrong way. Almost instantly it reared up as tho bent on a mad attempt to pierce the heavens. But after a moment it seemed to perceive the folly of such an undertaking and gradually slowed up till it came almost to a stop, with the front of the machine still pointing heavenward. By this time I had recovered myself and reversed the rudder to its full extent, at the same time climbing upward toward the front, so as to bring my weight to bear on the part that was too high. Under this heroic treatment the machine turned downward and soon began to gather headway again. By the time the ground was reached it was under fair control, but as one wing touched first, it swung around in landing and came to rest with the wind blowing in from the rear. There was no unusual shock in landing and no damage at all resulted. In several other glides there were disturbances of the lateral equilibrium, more marked than we had been accustomed to experience with the former machines, and we were at a loss to know what the cause might be. The new machine had a much greater tip-to-tip dimension than our former machines; it also had a vertical tail, while the earlier ones were tailless; and the wing tips were on a line with the center, while the old machine had the tips drawn down like a gull's wings. We decided to begin alterations at the wing tips, and the next day made the necessary changes, thus bringing the tips six inches lower than the center.

In the next trials my brother Orville did most of the gliding. After a few preliminary flights to accustom himself to the new method of operating the front rudder, he felt himself ready to undertake the management of the lateral control also. Shortly afterward he started on a flight, with one wing slightly higher than the other. This caused the machine to veer to the left. He waited a moment to see whether it would right itself, but finding that it did not, then decided to apply the control. At the very instant he did this, however, the right wing most unexpectedly raised much worse than before, and led him to think that possibly he had made a mistake. A moment of thought was required to assure himself that he had made the right motion and another to increase the movement. Meanwhile he had neglected the front rudder by which the fore and aft balance was maintained. The machine turned up in front more and more, till it assumed a most dangerous attitude. We who were on the ground noticed this in advance of the navigator, who was thoroughly absorbed in the attempt to restore the lateral balance, but our shouts of alarm were drowned by the howlings of the wind. It was only when the machine came to a stop and started backward that he at length realized the true situation. From the hight of nearly 30 feet the machine sailed diagonally backward till it struck the ground. The unlucky aëronaut had time for one hasty glance behind him, and the next instant found himself the center of a mass of fluttering wreckage.

This little misadventure, which occurred almost at the very beginning of our practice with the new machine, was the only thing approaching an accident that happened during these experiments, and was the only occasion on which the machine suffered any injury. The latter was made as good as new by a few days' labor, and was not again broken in any of the many hundred glides which we subsequently made with it. By long practice the management of a flying machine should become as instinctive as the balancing movements a man unconsciously employs with every step in walking, but in the early days it is easy to make blunders. For the purpose of reducing the danger to the lowest possible point we usually kept close to the ground. Often a glide of several hundred feet would be made at a hight of a few feet, or even a few inches sometimes. It was the aim to avoid unnecessary risk. While the high flights were more spectacular, the low ones were fully as valuable for training purposes.

During a period of five weeks of 1902 glides were made whenever the weather conditions were favorable. In the last six days of experiment we made more than 375, but these included

our very best days. The total number for the season was probably between 700 and 1,000. The longest glide was 622½ feet, and the time 20 seconds. On one day of experiments we made a few attempts at records. A line was drawn a short distance up the slope as a starting mark, and four trials were made. Twice the machine landed on the same spot. The distance was 156½ feet, and the angle of descent exactly 5 degrees. Time, 6½ seconds. From a point higher up the slope, the best angle was 5 degrees and 25 minutes for a glide of 225 feet. Time, 10½ seconds. The wind was blowing about 9 miles an hour. The glides were made directly to windward and straight down the slope.

In October last we resumed the trials on the Kill Devil practice ground with the machine which we had used during the previous year, and succeeded in making flights in which the operator remained in the air over a minute, at one time being suspended 1 minute 11 4-5 seconds. While carrying on the experiments, our power machine was under construction. In dimensions it measures a little over 40 feet from tip to tip of the wings, of which there are a pair. Its length fore and aft, to use a nautical phrase, is about 20 feet, and the weight, including that of the operator, as well as the engine and other machinery, is slightly over 700 pounds. We designed the machine to be driven by a pair of aërial screw propellers placed just behind the main wings. One of the propellers was set to revolve vertically and intended to give a forward motion, while the other underneath the machine and revolving horizontally, was to assist in sustaining it in the air.

We decided to use a gasoline motor for power, and constructed one of the 4-cycle type, which, revolving at a speed of 1,200 revolutions a minute, would develop 16 brake horse-power. It was provided with cylinders of 4-inch diameter and having a 4-inch stroke and intended to consume between 9 and 10 pounds of gasoline an hour. The weight of the engine, including the wheel, is 152 pounds.

We had calculated that this amount of mechanical power would be sufficient to maintain the machine in the air, as well as to propel it, the calculations being the result of gliding experiments, which showed that when the wind was blowing at a rate of 18 miles an hour the power consumed in operation was equal to 1½ horse-power, while with a wind of 25 miles an hour it represented 2 horse-power, being capable of sustaining a weight of 160 pounds per horse-power at the 18-mile rate.

After the motor device was completed, two flights were made by my brother and two by myself on December 17th last. The apparatus had been placed on a single rail track, built on the level, the track supporting it at a hight of 8 inches from the ground. It was moved along the rail by the motor, and after running about 40 feet ascended into the air. The first flight covered but a short distance. Upon each successive attempt, however, the distance was increased, until at the last trial the machine flew a distance of a little over a half mile through the air by actual measurement. We decided that the flight ended here, because the operator touched a slight hummock of sand by turning the rudder too far in attempting to go nearer to the surface. The experiments, however, showed that it possessed sufficient power to remain suspended longer if desired. According to the time taken of each flight a speed varying from 30 to 35 miles an hour was attained in the air.

We should have postponed these trials until the coming season, but for the fact that we wished to satisfy ourselves whether the machine had sufficient power to fly, sufficient strength to withstand the shock of landing, sufficient capacity to control. Winter had already set in when the last trials were made, but these facts were definitely established, and we know that the age of the flying machine has come at last.

DAYTON, OHIO.

The Land of the Midday Moon

BY FRANCIS E. CLARK, D.D.

PRESIDENT OF THE UNITED SOCIETY OF CHRISTIAN ENDEAVOR

WHEN, early in February, I took my seat in a very comfortable carriage of the well managed State Railway of Sweden at Stockholm, with the headlight of the engine pointing toward the Arctic Circle, I found that only half a dozen passengers of the same class were going to make the journey with me, and these were solely on business bound. Not a tourist of any nationality was among them. An American is a *rara avis* in Northern Sweden in Winter, and I had the whole of my compartment to myself for nearly a thousand miles. This incident simply shows that as yet the glories of these northern latitudes in winter have not been discovered; and, in fact, it is only within a very recent time that they have become accessible to the traveler, at least to him who insists upon combining comfort and speed with his sight seeing.

To be sure, they have always been open to the rugged tourist who, like Bayard Taylor in his younger days, could ensconce himself in the robes and hay of a Swedish sledge, and hire a Swedish pony to carry him over the unfrequented roads, or who was willing to essay the ludicrous perils of a reindeer ride. But to undertake such a journey required more hardihood and love of adventure than is given to most men, and only recently, within a very few years, has it become possible to see these same glorious sights, for which Bayard Taylor risked frost-bitten ears and toes, from the luxurious upholstered quarters of one of the best railway trains in the world.

This railway was not built primarily for the convenience of the tourist, but was attracted northward by the lodestone of the great iron mountains at Gellivara and Malmberget, which lie well beyond the Arctic Circle; and now the road has been pushed on two hundred miles further to Kiruna, on the banks of the Arctic Sea, to afford an outlet for this wonderful deposit of iron on the Atlantic side of Scandinavia as well as on the Baltic shore.

But, whatever the purpose of the railway, or its original intent, the fact remains that it has been built and is well built and well equipped; that the trains run regularly, and exactly on schedule time; that the rolling stock is substantial and of the most modern type, and that the second-class cars (for only second and third class are at present used on this northern section of the road) are commodious, comfortable, and even luxurious in their appointments, furnishing handsomely upholstered seats by day and comfortable beds by night; that the road is almost never impeded by snow even in these high northern latitudes; and that the fares are extraordinarily cheap. When all these attractions are combined it is easy to see that a journey to Northern Sweden in winter time may easily compete in attractiveness with a tour in Southern Italy, or sun-baked Egypt.

I cannot describe adequately, much less exaggerate the beauties of that wonderful journey, from Stockholm to Kiruna.

As soon as the train leaves the environs of the Swedish capital, one of the most beautiful cities in all the world, and well worthy of a visit in summer or winter, its joys begin. Snow of the purest and whitest, unsullied by factory smoke or the tramp of grimy boots, lies spread everywhere upon the landscape, like a fleecy coverlet of softest down. The coverlet is not too thick, however, so as to be clumsy and burdensome, for the snowfall in Northern Sweden is by no means so heavy as one would suppose from its northern latitude. On the coast of Norway it is much heavier, as the abundant moisure borne from the Atlantic Ocean falls there, and does not so largely get across the mountains which separate Northern Sweden from Norway. North of Trondhjem in Norway

In Northern Sweden

I found the houses buried up to their eaves in snow, the fences and hedgerows entirely obliterated, and even the telegraph poles standing waist deep in snow banks. On the Swedish side of the mountains, however, tho there is sufficient snow for all practical purposes, it is not usually such an appalling and overwhelming thing as in many lower latitudes. Railway trains have little difficulty in making their way through it, and there are seldom such astounding drifts of wind-driven snow as often exhaust the energies of railroad men in the United States.

One of the chief attractions of this winter scene in Scandinavia comes from the remarkable stillness of the atmosphere. Storms are few in the late winter, and the wind breathes in zephyrs instead of cyclones. However intensely cold it may be, it is comparatively endurable, if not accentuated by a bitter wind, and there is nothing more delicious than a walk or drive on a still crisp sparkling morning over these roads of polished white marble, or on the diamond encrusted fields of snow.

This remarkable stillness of the atmosphere, which often prevails for weeks at a time, adds another charm to the landscape, in that the snow loads every tree and bush and fence rail with a fleecy burden that remains in its place for days, without being disturbed by the slightest puff of wind. In the journey which I am describing, there had been no snowfall for fully two weeks, and yet the stately pine trees were loaded with pyramids of white, until each one looked like a canvas tent, and a forest of trees like a bivouac of soldiers, the lofty roofs of their tents gleaming in the sunlight. Every lady birch, too, drooping gently under its burden, remains thus gracefully bowing to the sturdy pines and oaks, tho apparently never weighted to the breaking point by the snow.

The journey from Stockholm to Gellivara, which may well be our first stopping point, a distance of some seven hundred miles, requires about thirty-three hours, and can be made without change of cars. Soon after leaving Stockholm the train stops for a few moments at Upsala, the city of Sweden's

great university, with its stately buildings, its magnificent library and its hoary traditions; for Upsala has been connected during all the centuries of Swedish history with the greatest and most stirring events of the national annals. Here is the historical center of Sweden. Eight hundred years ago the archiepiscopal see was transferred to this city and the Gothic cathedral, finished nearly five centuries ago, is the architectural pride of the nation.

But the glories of a Swedish winter are too tempting to allow us to linger long even in Upsala itself, and tho we may wait over a train or two, we will soon find ourselves speeding northward again. There are few large towns to interest us on the rest of the journey; even the villages are few and far between, but the scenic beauties of the snow land never pall upon us. Perhaps the most beautiful surprise comes when we wake up on the first morning after leaving Stockholm, and find, if we are so fortunate, that the fairies have been at work while we slept, and have rimmed every twig and pine needle and every spray on every bush with thick frosty rime. Once in a lifetime one sees such a sight in America. In Sweden it is an almost everyday occurrence, but it is always inexpressibly lovely. So lavish are these frosty decorations that no humblest stump or fence rail is omitted in the distribution of these glittering treasures. It is no little layer of frost either that has to be examined with a microscope to see its beauties, but a thick and heavy fringe, often fully two inches deep, I should judge. Neither is it an evanescent creation of the fairies, for, as the low running sun is not yet very powerful, it does not melt until well along toward high noon, and there is no wind to dissipate it.

Even when this glory of the morning frost is gone the snow still remains on all the larger branches of the trees, and one misses only the fine tracery of the frost which brings out in marvelous black and white the wonders of this rarely beautiful winter scene.

The views on this journey are seldom imposing and grand; there are no Alps, and even our own White Mountains eclipse in majesty anything that I have seen in Northern Sweden. For the most

Ermine-tipped Pines. Group of Skis in the Foreground

part the landscape is a peaceful pastoral one. Little farm houses, with their cluster of out buildings, abound; the stables for the cattle and the hardy horses being built as warm as the cottages for the hardy men and women. The smoke curls up straight toward the zenith, and hangs like a cloudy pillar over every chimney. The people who come to the railway stations are healthy and ruddy, well contented with their lot, as, indeed, there is no reason why they should not be.

Sometimes, however, the scenery grows more bold and striking. Some hills of considerable size appear upon the horizon; charming valleys open up between them, where the frequency of farm houses shows that the soil is peculiarly fertile; wide brawling rivers rush to the sea so impetuously that even Arctic cold cannot fetter them. There are hours of such scenery which satisfy the desires of the most romantic imagination; yet for the most part there is a mild and subdued loveliness about the view from our car window which has its own peculiar charms, and which needs no precipitous cliffs, or bleak mountain sides, or cavernous gorges to enhance its beauty.

After a time the snowy charms of the landscape may allow us to turn our attention to our fellow passengers, or to the inhabitants of the country whom we may see at the railway stations. We shall find the study interesting and satisfactory, for we are among the kindest, politest and most honest people in the world. You need not count your change, or examine every coin with scrupulous care, with the expectation that the man you are trading with has given you insufficient change or palmed off spurious metal upon you, as you must do in Italy. Without counting it you can pocket your small coins with the confident conclusion that if any one is cheated it is the dealer himself, rather than the unsuspecting traveler. Your fellow passengers are politely interested in your welfare, but not inquisitive. If they see that you prefer your book or your writing case they will not intrude upon you from sunrise to sunset. But if you wish information about the country, or get into trouble with an unfamiliar language, they will give you every assistance in any one of the three or four different languages of which most educated Swedes are masters.

The Swedish language is one of the most musical in the world, and as you listen to a company of educated Swedes talking together they seem to sing their sentences, and one almost thinks that they are talking in improvised rime and meter. Some of the words are exceedingly like English in all the Scandinavian languages, and when you see in Copenhagen that a man is a "Victualie-handel," and that he has "Fin The" for sale, you do not have to look into his windows to see his assorted groceries, or the Oolong mark on his tea chest. Over the butcher's shop you will see "Cottelet, Kalv, Svin and Lam," while in a Swedish tram car you have little difficulty with the signs, which tell you how many seats and standing places there are within and upon the platform, and also give a piece of information of interest to smokers, all on the same card, as follows: "Tobaks rokning are Forbjudning, Settande 12, Staende 3, a bake platforme staende 4."

At a railway station you will see the somewhat startling sign "Dam Rum," which is not at all profane, nor is it the objurgation of a teetotaller against spirituous liquors, but simply points to the ladies' apartment, or dames' room. The "Rak Salong" is another frequent sign in Swedish cities, which has at first a sinister look to American eyes, but we soon find that it only indicates a barber's shop.

These signs and common words in Scandinavia are so unlike our own, and yet at the same time so similar, that one almost feels as if he were taking a journey with Alice in Wonderland.

In some districts of Northern Sweden almost every man, woman and child who comes to the railway station will travel on long skis, which form the universal means of locomotion over the snow fields. Skiing is, indeed, the most popular pastime of these northern latitudes, and bids fair to rival golf or tennis as an international sport. Already many English and American people go to Christiania every winter for the sake of the skiing, and some of the great hotels overlooking that beautiful city rely for their popu-

larity very largely on their skiing facilities. It is, indeed, a fascinating sport, either to engage in or to watch.

I saw in Stockholm on one occasion the cadets from the naval academy practicing on their skis, and I never saw more bewitching and exciting sport. Starting from the top of a considerable hill, they gained momentum with every yard traveled, until their speed rivaled a fast railway train. About half way down the hill, when going at the swiftest, they came to an artificial embankment; then, crouching low, they made a mighty spring over this bank twenty feet into the air, coming down on their long wooden runners, and without a break or the slightest retarding of their speed they kept on in their headlong career to the bottom of the hill, across the road and up another hill, on the wings of the wind. Sometimes two sailor lads would take each other by the hand and make their tremendous leap together, never losing their grip on each other in midair, when they struck the snow once more, or when they ascended the opposite hill.

Leaping on Skis from the Artificial Embankment on the Descent

It is not necessary, however, to go to Stockholm or Christiania to find this sport in its perfection, for every hillside in Sweden is furrowed with the marks of the skis, and every country village affords magnificent opportunity for this splendid sport.

But to return to our journey: The railway eating houses are sources of constant interest, not only to the hungry man, but to every one who is in search of national characteristics or gastronomic novelties. Shall we descend to such trivial things? It takes some little time to get used to these restaurant customs, but when one understands them he quite enjoys their go-as-you-please style. On one end of a long table, or on a side table by itself, are cold viands of every kind. A dozen kinds of pickled fish are there, which the Swede greatly affects; four or five kinds of cold meat, two or three varieties of cheese, and all sorts of toothsome snacks, to say nothing of little mountains of delicious fresh butter and larger hills of snow-white bread, or the hard, black rye cakes of the country.

It is always safe under such circumstances to watch your fellow passengers, and imitate their example to the best of your ability. If you thus take a lesson in Swedish restaurant manners, you will see the natives, one by one, wander nonchalantly to this "bread and butter table," which I have already described, spread a piece of rye cake with butter, help themselves to one of the little fishes "biled in ile," or a slice of the cold meat, and then walk around the room, their sandwich in hand, munching away carelessly, or conversing with any neighbor whom they may meet.

But this is only a preliminary. After five or six minutes of such a perambulatory meal they settle down to business, and if you are wise you follow their example. You take a plate from the pile at the other end of the table, where the hot dishes are displayed, and you load it as suits your fancy, with roast beef or roast lamb, chicken or pork, potatoes or other vegetables which the season may afford. You can add the gravy and mint

sauce if you like, or let it alone. You take a knife and fork from the pile of polished silver, a snowy napkin, which is also at your disposal, and carry your booty to a small table nearby. Then you return to the large table, if you choose, for a cup of coffee or tea.

Having disposed of these substantial dishes you return to the charge, and, taking another plate from another pile, help yourself to pudding or pie, or tart or sauce, as your fancy inclines you. Once more you return for a piece of delicious Swedish cheese, a scrap of bread and butter, an apple or an orange, to put the finishing touches upon such a meal as one can get at very few railroad restaurants in all the world.

And this in midwinter upon the borders of the Arctic Circle, in a wilderness of snow and ice, where no green thing will show its head for months to come! The last land in the world which you would expect to flow with such metaphorical milk and honey at its railway restaurants treats you better than any other in which you may travel, for the dishes are not only abundant, but of the best quality and deliciously cooked.

When you come to pay you have another surprise, for no officious waiter is hovering around with his bill, counting the pieces of bread which you have eaten or the number of nuts that you may have cracked for your dessert, as in some continental countries; no smirking *garçon* in a swallow tail coat, gauging his politeness by the expected size of his tip; but, as you help yourself to your own dinner, so you hunt up your cashier, who sits behind a table in a remote corner of the room, waiting for you to pay your dues when you get ready.

Moreover, the cashier trusts your honesty implicitly. If you tell her that you have only patronized the bread and butter table, she accepts your assertion, and gives you back one-half of the twenty-five-cent piece which you offer her for your meal. If, however, you have been tempted to go "the whole figure," and indulge in the Swedish equivalent of an American "square meal," you have to pay two crowns, or about fifty cents, for a more delicious repast than any railway restaurant in America furnishes for twice the sum.

When I came to pay such a modest bill at one of the railway restaurants well beyond the Arctic Circle, the pretty cashier, when she saw that I spoke English, beamed all over with delight, and exclaimed in rapturous joy, "When did you come over, and how are all the folks?" In the remaining minute before the train started, I found that she had lived for several years in America, where she had many relatives, as, in fact, has almost every Swede that you meet, and that she had only just returned to her Arctic home. I was glad to inform her that all the folks in America were well, so far as my knowledge extended, and this artless little piece of Americanism amid the snows of Sweden brightened the journey for many an hour.

When night comes on within our car a bright electric lamp begins to glow overhead, whose radiance we can shield from our eyes with a dark curtain when we go to sleep. Soon a porter, who has been invisible during the day, appears, and asks us if we would like our bed made up. If we choose to use our own rugs and stretch out on one of the berths into which our compartment is made it will cost us but seventy-five cents for the night, while if we choose to have sheets and pillow cases and blankets furnished it will cost us another quarter of a dollar, a moderate tariff at which our Pullmans and Wagners would sneeze, even should we choose the largest luxury obtainable.

Our compartment is beautifully upholstered from top to bottom in plush of variegated colors, and there is a pretty carpet upon the floor. The double windows keep out the cold, and the corridor which runs along the side of the compartments affords egress and ingress to the car, so that when the door is shut no one disturbs us through all the long hours of the night, and a most delicious and refreshing night's sleep is obtainable. Washing and toilet accommodations are all that could be desired, and the *carafe* of fresh water, frequently renewed, with sparkling glasses of delicate crystal, occupy a little shelf over the mirror in our stateroom.

Again I must remind my readers that all this comfort and luxury is found on the borders of the Arctic Circle, and that for it, in addition to the very moderate

charges for sleeping berth and meals, he is charged by the railway authorities only about one cent a mile, the cheapest railway fares that I have found in any part of the world, for anything like such excellent accommodations.

As one goes North there are no sudden or marked changes in the landscape. Gradually the country becomes more barren and less inhabited, and the trees more

Scene from the Car Window

and more stunted. Few of them can survive the Arctic cold, except the hard pines and the white birches, the most hardy of all our trees. But even these do not have summer time and sunlight enough to show what they can do in more southerly climes, and all have a dwarfed and stunted appearance, like the Laplanders themselves, who live in their shade.

However, the glories of the snow do not decrease, but are rather enhanced, as one journeys northward. Not a breath of biting wind disturbs the calm serenity of the scene. Where the snow falls, there it lies, and the lovely purity and whiteness of the landscape never weary one. About three hours beyond Polcirklen loom the great hills, some 1,500 or 2,000 feet high, built of solid iron, that have attracted the railway to this point. Here is the thriving city of Gellivara, and five miles beyond twinkle the electric lights of Malmberget, which lies high up on the mountain side, in the midst of the iron mines themselves. Here for seventeen days at midsummer the sun never sets, and for seventeen days in midwinter he never rises. If you climb that frowning iron mountain, on top of which the Swedish Tourist Club has built a stone hut for such enterprising tourists as yourself, you can see the midnight sun every day for more than a fortnight in June and July, while from any street or window in Gellivara you can, in December or January, grow romantic under the rays of the midday moon.

I have never seen in all my life a more exquisite sunset than I beheld on the

nineteenth of February last from the hills beyond Gellivara. The train reached the town about three o'clock, and the sun was already near its setting. After depositing my few belongings in the modest hotel near the railway station, I sallied out to view my first Arctic sunset. A mile beyond the town I could see that the road led up a considerable ascent, which I rightly thought would prove a coign of vantage for the beautiful scene which had already begun to display itself in the western sky.

Before I reached my hilltop the sun was already below the horizon, but for hours his beams played upon the fleecy clouds, and constantly changed them from glory to glory. At one time the brilliant reds predominated, and the splashes of color lighting up the white snow would have put even Turner's pictures to the blush. After many minutes these fiery colors change to exquisite green and blue tints, and broken opalescent hues adorned the clouds. Then a red gleam showed under the dark blue cloud, the sun seemed to summon all its strength for one last burst of glory, and the western sky, which I thought had passed its acme, glowed once more with a deep red, as tho some vast furnace was throwing its hidden light upon the clouds. For fully three hours this wonderful display lasted, and it was not till nearly seven o'clock that the last beams of setting day had entirely faded.

But the beauty of the scene did not consist altogether in the glorious colors of the sunset. All the accessories made it forever memorable. The stillness on that hilltop could almost be felt. A dog barking a mile away was distinctly audible. The axes of the workmen, whom I left building a log house, half a mile below me, as I climbed the hillside, made a melodious tapping which was entirely audible. The trees everywhere were loaded with their beautiful burden of snow. The pines and the birches seemed in the dim light of the setting sun to have blossomed out like cherry trees in May. The mercury registered nearly twenty degrees below zero, but the air was so dry and still that the ordinary clothes which I found necessary, and none too much, for Boston east winds, were entirely sufficient. As I came down the hill the workmen were still busy on their log house in the deepening twlight. A Yankee in a white slouch hat must be a rarity in these altitudes in winter, but they did not pause in their work, or exhibit any curiosity at the sight of an outlander. Perhaps their natures partake of the largeness and solitude of their great forests and snow fields, and they are not moved by the curiosity which affects other mortals. After watching them a few moments, I left them fitting their logs together without nails or spikes, sawing and cutting with bare hands in this zero weather as tho it was balmy June.

Beyond Gellivara lie other towns and villages still further to the north. The railway has laid its track with greatest difficulty through the mountain gorges, which grow more precipitous as one goes north, until, at last, it comes out in Northern Norway, at an open port which the Gulf Stream never allows the Frost King to fetter. All the way it is a scene of beauty, and a perpetual joy to the traveler, who may have been cloyed with more ordinary sights in warmer climes.

If one can stop for a day or two at any of these towns, a ride in a comfortable Swedish sleigh will bring him to some encampment of nomad Lapps, with their herds of reindeer, their one and only source of wealth. Everywhere the roads are good; the sleighing is excellent; the air is sparkling, the scenery charming, and everything in the sky above and the earth beneath invites you to remain longer, or to repeat once more your journey to the Land of the Midday Moon.

Boston, Mass.

My Life in the Penitentiary

[The convict who, after his release, writes the article which follows, is a man of education, who entered upon his term of imprisonment with a keen sense of the degradation that attached to it and a clear conception of the justice of the punishment with which society visited his crime. A man of unusual keenness of intellect, even as it applied to the moral order, he cherished no resentment against the society that made his incarceration its reprisal. Nor, upon his release, did he entertain any opinion of his jailers other than that which he believed to be a just appraisement of their personal characters. The study of prison life, in what is conceded to be one of the model penitentiaries of the United States, gives in frank detail its effect upon the mind and spirits of the ordinary, intelligent prisoner; but, when all is said, it would appear that a convict, not serving a life term and endowed with some small measure of philosophical patience, need not find his punishment wholly insupportable. The evidence of this paper strongly supports the view, held by many eminent penologists, that the reformatory value of all systems of solitary confinement is least appreciable among those most urgently in need of moral correction, as distinguished from the punitive measures now happily in disesteem. Violent outbreaks, as well as sullen resistance to prison disciplinary methods—and prompt or ultimate return after release to the vicious courses which brought about the first arrest—are far more common with convicts of a low grade of intelligence than they are with men of the type represented by the writer.—EDITOR.]

"TICK-Tick! Tick-tick-tick!"

The clear, distinct sounds, coming from the outer side of my cell, were like music. To be imprisoned is bad; to suffer solitary confinement is infinitely worse. I count myself somewhat of a philosopher. In the beginning I tried to reconcile myself to prison life, but the lack of companionship bore heavily on me. I was often tempted to shout over the transom to the men in the adjoining cells, and I was always deterred by the thought of the swift and heavy punishment that would inevitably follow. I was moping one day, thinking of this, when my heart was gladdened by the magic taps on the other side of the cell wall.

I had been a telegraph operator in my early youth and I instantly recognized the intervals of the Morse system. Here was a man who understood the code and was trying to talk to me. I strained my ears and spelled out the taps with painful eagerness. There were taps and then dashes, and then more taps, as follows:

.... . — — ..

"Hello!" my unknown friend was saying with the slate pencil he was using as a sending key.

I called back "Hello!" and he put a series of questions, which I answered to his satisfaction and my own great delight. That was the beginning of a series of conversations which lasted, with intervals, during the most onerous portion of my term of imprisonment. We learned each other's names, why we were in jail, and for how long. It was Coptic to the keepers, and, using ordinary discretion, we were enabled to make our cloistered life more nearly endurable.

I do not intend to name the crime that sent me to the Penitentiary. It has nothing to do with the purpose of the narrative. Suffice it to say that I served a term for a penal offense.

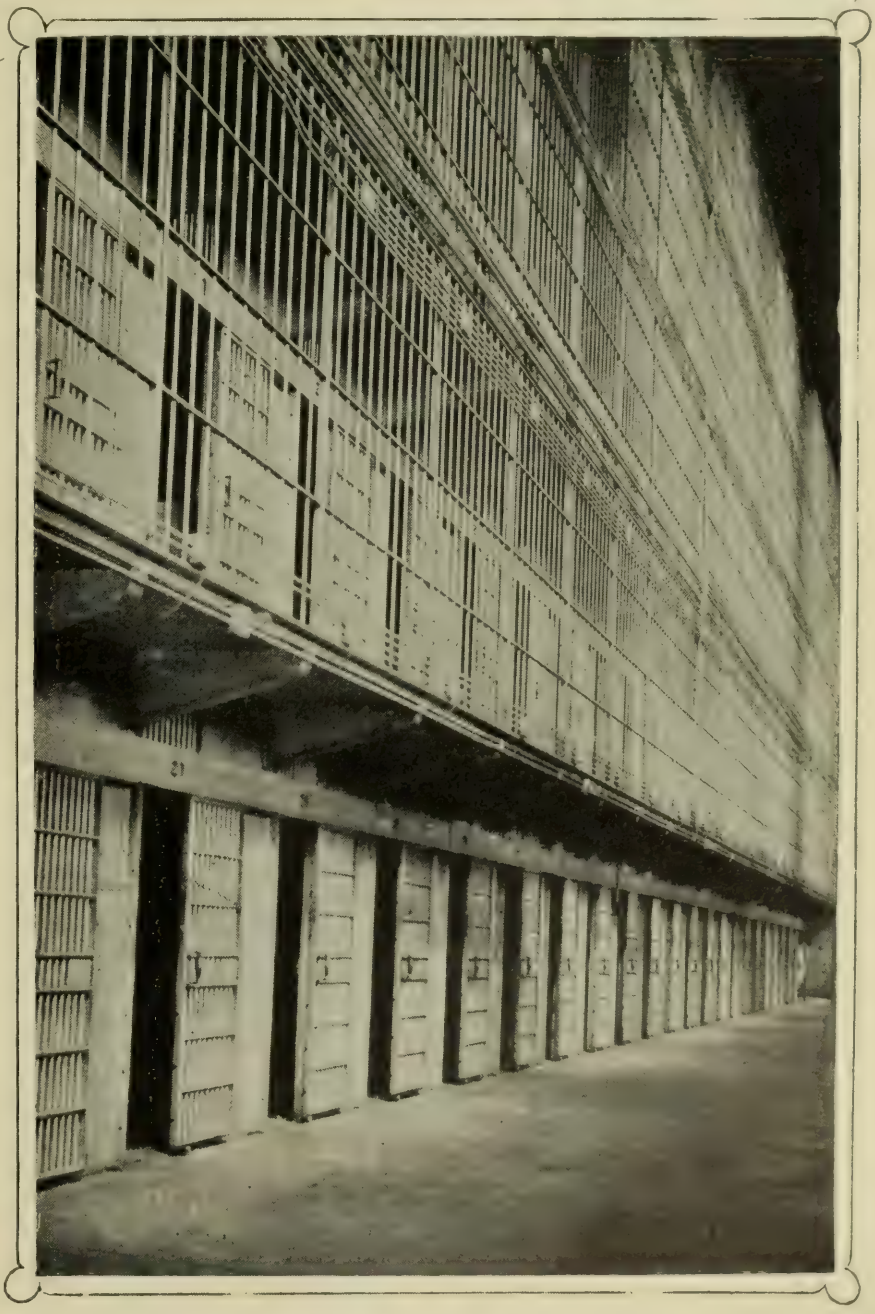
I first experienced the peculiar feeling that comes over a man with the loss of liberty when I was thrust into the prison van, at the court house door. When we drew up before the big iron gates and the dull gray walls of the Penitentiary, the full significance of my situation dawned on me. There are moments in our lives when the most trivial details make a lasting impression upon our memories. This, for me, was one of those moments. I can recall as if it were yesterday the pattern of that prison door and the detail that it was thickly studded with nails of an enormous size. I remember that the cold walls were partly covered with a luxurious growth of what is commonly known as a Virginia creeper, which gave a touch of color and a hint of warmth to an otherwise bleak and desolate outlook. On one side was life and liberty: the birds, the trees, the sunshine, the bustle and roar of a great city. On the other was solitary confinement, with the world—the great, throbbing, inexhaustible universe—compressed into a 6 x 8 cell, 9 feet in hight. The gate opened to receive me in the spring time. As the door swung into place a brazen toned

gong broke the silence, a very counterpart of that sad, monotonous bell that rings out when a funeral procession is slowly wending its way through a cemetery gate.

Once inside the prison, the door was heavily barred. There came a small, covered passageway, and then we were confronted by another closed gate. The two gates are never allowed to be opened at the same time. The second door was carefully unlocked and opened, and we walked across an open courtyard into the office of the prison physician. He made a minute examination of my physical condition. My personal history was entered on the "Receiving Book." It told my age, my nativity, trade, complexion, color of eyes and hair, stature, the peculiar marks on my body, names of my parents, the fact that I knew how to read and write, was temperate, unmarried, and owned no property. When the clerk had concluded I was taken to another room, stripped and given my first prison bath. After putting on the prison suit, consisting of a flannel shirt, a pair of trousers and a blouse of blue material, and a pair of heavy soled shoes, I lost my name and became a number.

My cell—my future home—caused my heart to sink. It was spotlessly clean, but cheerlessly cold. The furnishings were meager. An iron cot, on one side, contained a pillow, a counterpane and a quilt. There was no chair—in lieu there was a little wooden, two legged stool. On the wall was fastened a mite of a closet, where, I was told, I might put the remains of any of my prison meals—if there ever were any remains. A little sink completed the trappings of the narrow abode which was to be mine for nearly two long years. As I stood there, looking through the iron gratings into the dreary corridor, I felt sick.

A Convict's Hour of Leisure



For a time I walked around and around the cramped apartment, like a rat in a trap. There was a rear door, which, I afterward learned, led to a tiny yard, where the prisoners were permitted to go for fresh air and recreation during a certain period each day. Glancing up above the corridor doorway, I noticed an inscription, which had been left upon the wall by my predecessor—who was he, anyhow? It read:

"I believe in God, my Father,
And in Jesus Christ, my Savior,
And in the Holy Spirit,
Who comforts me and leads me unto all truth."

I passed a sleepless night on that hard

bed, and when I rose in the morning I felt my position more keenly than ever. I found a tin basin and discovered that my supply of water was controlled by means of a stop-cock. There was a coarse towel on a rack, a comb and a brush and a toothbrush. Besides these things there was a scrubbing brush and a sweeper, for each convict was expected to keep his cell clean. When I had washed my face and hands and combed my hair, I sat and waited for the overseer to visit me. Not a sound was to be heard anywhere. I peered through the lattice work of my cell; not a living being was in sight. The oppressiveness of silence began to prey upon me. Oh, the agony of it! I only wish I had the power to express it in words, but that would require the skill of a Stevenson or the genius of a Hugo. It bore down upon me like an awful nightmare. Did you ever have a horrible dream, when a weight like lead seemed to be crushing you to the earth, and when you had an intense desire to yell at the top of your voice and could not find the power to do so? Well, that feeling only begins to give you an inkling of the tortures I suffered from the ghastly, deathly silence of my first few days in the Penitentiary.

Presently, when the stillness had become nerve-racking, I heard footsteps in the corridor. The overseer came along with a handcart. I put out my mess-pan, and a huge piece of bread, partly cut into slices, was placed in it. A can, holding nearly a quart, was filled with smoking hot coffee. For dinner I had boiled mutton and potatoes, and for supper stewed prunes and tea. That may not look like the *table d'hôte* of the Waldorf-Astoria, but it was plain and wholesome. What troubled me most was the fact that I had to take my coffee and tea without sugar or milk, and my bread without butter; this was a penance to me. Dinner was the one meal of the day. It varied from bean soup all the way to boiled ham and rice. On Wednesday nights we had dates for supper, and on Saturday nights we received figs. Every Sunday was a red-letter night in our calendar, for then we each received a can of cocoa and two big home-made ginger cakes. It did not take me long to discover that prisoners

Bars Within Bars

without organic troubles thrived on this sort of living. To tell the truth, we lived a great deal better than many persons outside the prison walls.

The unexpected sometimes happens—even in prison. One fine morning I was informed that I was to have a cell mate. Solitary confinement for me was to be at an end. The officials did it, not from any special consideration, nor because they were willing to surrender the principle of the thing, but simply because the Penitentiary was overcrowded. I thought, whimsically, that prosperity was extending even to the prisons, and that my hostelry, like a seashore inn, would soon be compelled to ask some of its guests to sleep in the office.

The newcomer was evidently a man of refinement. He seemed delighted at the thought of company. When the keepers were out of sight he greeted me effusively. He talked to me in a superior sort of way and intimated that he had seen better days. He said he had influential friends, and I do not doubt it, for he had more visitors than all of the prisoners on our tier combined. I have a pretty good knowledge of German, and he said if I would give him lessons in that language he would see that I was repaid for it in many little ways. I readily undertook the task and found him to be an apt pupil. His self-improvement was carried on during our leisure hours.

He had not been there ten days when he received a visitor, who came muffled in a big storm coat. I asked the stranger whether it was freezing outside, at which he indulged in laughter. When he recovered himself he winked at me, and, diving down into one of the pockets of the greatcoat, he drew forth a little crock of butter. He went into another pocket and produced a glass of jelly. I looked on in amazement, but he only winked at me again and brought out a bag of sugar and a can of condensed milk. They were handed, one at a time, to my cell mate, who took them as a matter of course and, apparently, without any symptoms of gratititude.

"Before I get out," said the visitor, "see that those things are put where they won't be seen."

They were stowed away with tender care. The condensed milk was put under the cot, the jelly and the butter in the little closet, and the sugar in the pocket of an old coat.

"My boy," said the stranger to my companion, "don't expose them unnecessarily. We don't want to make it harder for the guard than can be helped."

"My boy" promised, sullenly enough, I thought, and, when the visitor had gone, he turned to me with a leer and said:

"Now, if you are good, I may share some of these things with you. It all depends on yourself."

"Oh, thank you," I replied, with a burlesque bow.

"You needn't," he said indifferently, yet noting the sarcasm in my voice and manner. Looking at me intently for a moment, he remarked: "You're a lucky dog! To think that, of all the people in this prison, you should be the one fortunate enough to share my cell."

It appeared to me that *he* was the man who was in *my* cell, but I forbore to argue the point. But from that day the mere physical presence of the man annoyed me. The way he lorded it over me was exasperating. He patronized me every time he opened his mouth.

The mysterious visitor in the storm coat came, not once or twice, but dozens of times; with every visit he left some delicacies. One day he brought half a dozen eggs. We rigged up a sauce-pan and a frying-pan in our modest apartment and had boiled eggs for breakfast and an egg omelette for dinner. On another day—ye gods, the thought of it makes my mouth water yet!—he brought half a dozen reed birds.

But, all the time, my fellow prisoner was wearing on me. He never gave me a pat of the butter or a spoonful of jelly without reminding me of the obligation I was under. Each day my feelings toward him grew more bitter. I came, finally, to hate the man. I used all the will power I possessed to kill the feeling. I argued with myself in the silence of the night, but to no avail. The climax came one sunny afternoon. I made some ordinary request of him and he granted it with a curl of the lip and in such a supercillious manner that I simply could not restrain myself any longer. I turned to and gave him a thrashing. He would not strike back; he merely yelled "Murder" at the top of his voice. Before the keepers

reached the cell I had painted both his eyes in the most artistic manner imaginable, and I hammered his nose until it looked like the Bloody Angle at Gettysburg. And oh, how happy I felt! It was a blessed relief to me. All my animosity had been worked off on his mean carcase. After that I felt almost sorry for the fellow. Looking at it in an impersonal manner, I thought I might even learn to grow fond of him.

I was taken to another cell and put on a diet of bread and water. At the end of twenty-four hours I was asked if I felt any contrition, and wrathfully replied that I felt none. The second day the bread was taken from me, but still I vouchsafed no signs of sorrow. The following morning I was removed to a darkened cell. They tell me I was there for only six hours, but until the day I die that experience will remain one of the aching parts of my memory. When the door was closed on me I groped around on my hands and knees. All that I could find, by feeling, was the four walls of the cell—not a chair, cot, table or closet of any description. Becoming wearied, I lay down on the floor of the black hole. I had not been there many minutes when something smooth and sleek passed noiselessly over my face. The sensation was one of pure horror; I shrieked out in frenzy. My cries echoed all about my stuffy and stifling apartment, but they brought no response from without. I jumped to my feet and walked guardedly around the cell, shielding my face with one hand and waving the other in front of me, in anticipation of an attack from some unseen, unknown foe. But none came. I was as restless as a lost soul. I could neither keep still nor move about for any length of time. Finally, worn out, I sat on the floor. I was again startled by the swish of some object passing me. I made a grab at random—and caught the tail of a rat. The vile thing began to squeak and gnaw at my fingers. I dropped it with a cry of rage. The thought of that thing coming at me again filled me with a loathing I can scarcely put into words. Weak, conquered and really frightened, I battered on the cell door and, at the top of my voice cried out: "Enough!" The keeper responded promptly. I promised never to resort to violence again—and kept my word.

Of course, I could not return to my lordly cell-mate. But I made myself a good prisoner and did my best to win back the confidence of the authorities.

The overseer who had charge of the tier of cells where I was next located was a low-browed fellow with the face of a murderer. He had a more forbidding countenance than any of the prisoners under his charge. Nevertheless, I got on with him famously. Possibly it was because I seemed to defer to him a great deal. I often did little odd jobs of work for him. I considered it a good investment in two ways. First, it kept me employed and so I had my mind occupied; and, second, it gained me the good will of an ill-tempered man.

Before I had been in the Penitentiary long I became an apprentice in the noble art of caning a chair. The man who has had no special training for trade in life is either taught to cane chairs or make brooms. I was quite successful. Fifty per cent. of the money earned went to the State, the other fifty per cent. was laid aside for me until the day of my discharge. One day I caned a chair for my keeper—free of charge, of course—and he was so pleased that he rewarded me with a handful of cigars. His generosity amazed me until I learned that the cigars were made by a convict in the next corridor from tobacco furnished by the State. It was one of the little perquisites of an overseer's position. I tried hard to discover some good traits in my keeper, but I did not succeed. He was surly and sometimes cruel to the prisoners. Once I saw him strike a defenseless man in the face with a heavy cane. The thought of that cowardly blow never left my mind all the time I was in prison, and I looked forward, with an obsession of anxiety, to the hour when he would ill-use me; but, I am glad to say, it never came.

In a few months I was promoted to the position of librarian of the prison, a post that I filled with pleasure to myself and to the satisfaction of the authorities. The library contained English, French, Spanish, Italian and Latin books. Of the English books 773 were of a religious character, 1,350 came under the head of

"instructive works," and 3,467 were flagrantly entertaining.

Meritorious behavior shortened my term of imprisonment very materially. My time ended when I was rather beginning to like the life. I was discharged with the good wishes of the prison officials and the $5 allowed by law. I had besides $73.50 as my wage for making cane bottoms for chairs.

My first feeling on coming out into the world again was a sense of utter helplessness. I looked at the pushing, bustling crowds and felt as weak as a child. But this anæmia of the spirit, together with my prison pallor, wore off in a few weeks. Through the influence of a friend I secured clerical employment in a position I still retain. I have had my ups and downs, but this is neither the time nor the place to recite them. I can only say that, in spite of all temptation, I remain honest and that three separate attempts to have me discharged, on account of my prison record, have failed.

After all, the majority of men and women in this world are humane; and, as for me—well, I have a painful reluctance to go to the Penitentiary again.

PHILADELPHIA.

Modern Advertising Methods

BY HROLF WISBY

RECENTLY MEMBER OF THE STAFF OF THE PHILADELPHIA COMMERCIAL MUSEUM

FEW people have any idea of the power wielded by advertising at the present day, and fewer still are acquainted with the modern tendencies that guide the expenditure of this power. A conservative and well-qualified estimate places the total annual outlay for advertising in the United States alone at $500,000,000, and of this enormous sum no less than 75 per cent. is in payment for space in newspapers, magazines and trade journals. In other words, we spend as much on advertising as Russia, Germany, France, Austria-Hungary and Spain spend on their armies every year. Huge as the expenditure is, it is not in undue proportion to the value of business done, being little less than 5 per cent. of the total annual sales of the United States. Assuming that two billion dollars are spent annually for advertising in all countries, it will be seen that our share as the leading nation in publicity methods is one-fourth of the total amount spent.

The newspapers occupy the most prominent position in the advertising arena. Their phenomenal growth from 2,526 modest specimens in 1850 to a round 25,000 at the present time does not, however, give any idea of the growth of the advertising they contain. The number of copies annually printed is about 4 billions, and counting an average of 100 "ads" to each copy, we face the gigantic number of 400,000 billion impressions of "ads" made yearly by the printing press. The energy here put forth in print is so exceptionally large that we need not consider the few hundred billion impressions taken by the magazines and trade organs. Of this energy how much is wasted in unsuccessful effort and how much by competition? Figures will never be able to tell the story. It is purely a matter of judgment as to what constitutes waste and what harmful competitive publicity, but the modern tendency is to have no fixed rules; to make each case a case for itself. In the majority of cases, however, competitive advertising is more likely to result in waste rather than in benefit, as it only increases the cost of putting the goods into the hands of customers without improving the quality of the goods.

The impossibility of fixing the factor of waste has turned the attention of the business man to the very modern and not unsatisfactory method of gauging the result of his

advertising by the tabular system. I do not mean what is generally known as result tables, such as are printed by mediums to show their efficiency, for they are often misleading and irreliable, and besides no one table of results can be made to fit all kinds of business. One medium may be the making of one advertiser and the undoing of another; the high rate and limited circulation of one may be offset by the quality of its readers, etc. The modern advertiser creates his own tabular matter out of the quantity of circulation measured by the rate for space, afterward tracing the outcome with "ad" keys. In this very simple way the advertiser gradually compiles accurate data, demonstrating in figures what it has paid him to do in advertising and what not. Instances are not wanting to show that such data constitute an important asset in building up the good will of a concern, which is not the least consideration at the sale or transfer of the business. In a proper system of this kind, the results shown will not be the number of inquiries received in answer to advertising, but the volume of trade obtained through the inquiries.

Experience gained by this and other means has given rise to very accurate ideas governing the size of appropriations for certain definite lines of advertising, but there are no general ideas and no system of rules that can possibly be made to apply to advertising in general. While 2½ per cent. of the sales amount is looked upon as being the ideal rate, 5 per cent. is more frequently spent nowadays, and there are instances when it has paid well to invest two-thirds of the capital in advertising. The data of department stores are very reliable in this respect. The twenty large department stores in New York City spend a total of $2,000,000 annually for advertising, or 4 per cent. of their combined sales of $50,000,000. A Chicago house improves upon this rate with a half per cent., giving $500,000 to publicity to sell $15,000,000 worth of goods.

The evolution of the advertising art has progressed so remarkably during recent years as to make the commercial traveler largely or wholly superfluous in many lines of trade that were formerly dependent upon his efforts. This tendency first evinced itself prominently in 1898, during which year twenty-eight large concerns in New York City, twenty-one in Chicago, seventeen in Boston and probably a score additional in other cities, discarded their traveling staff altogether, substituting printed matter. Tho advertising is making serious inroads on the domain of the salesman, he, nevertheless, continues to be one of the main assets in the general publicity scheme. There are some 350,000 commercial travelers in this country, costing on an average $2,000 per man, which amounts to a total expenditure of $700,000,000 annually. As each man is supposed to advertise his house as well as to solicit orders for goods, we may safely place at least one-third of his total expense —a round $230,000,000—to the credit of advertising.

The enormous increase in "consumption goods" is due more to women than to men. The bulk of modern advertising appeals more to the general household, and to the relief of housekeeping duties by means of novelties and contrivances, than to the business man. The growing popularity of evening papers as advertising mediums also points to the fact that woman is the chief buyer. During the day's housekeeping she has experienced certain benefits by the use of articles brought to her notice by advertising, and when the work is done, it is an evening, and not a morning, paper she scans for new announcements. In country homes woman is the principal buyer, and as there are six million farms in the country, containing probably thirty million people, to say nothing of the fifteen to twenty millions living in villages, the logic of appealing to the housekeeper by preference is quite justified by modern advertisers.

The number of general advertisers is not definitely known at present, estimates ranging between 10,000 and 20,000. Taking 15,000 as a safe mean we find that the number of general ad-

vertisers has almost doubled itself six times during the last five years, since 1898, when it was 2,583. The local advertisers number a round million, counting seventeen in every 1,000 inhabitants. These are the people who pay for advertising in all its forms, and the most successful of them disclaim the existence of rules and precedents of real aid to secure results.

Between 1828, when Orlando Bourne, the first advertising agent, hung out his shingle in New York City, and 1871, when one-half the agents in the country were hiving together in the Times Building of that city, doing nine-tenths of the annual publicity business transacted in the United States, the growth in volume of advertising was more remarkable than any improvement in the methods of publicity. Even magazine advertising did not begin until at the time of the Civil War, when in February, 1860, the first magazine "ad" appeared in the *Atlantic Monthly*. The rapid success of periodical publicity has led up to a present average of about five pages of advertising to seven of reading in the 160 leading monthlies of this country, having an aggregate circulation of 25,000,000 copies. The professional success of the advertising craft in making this huge volume of mere publicity vie in attractiveness and interest with the contents of the magazines, is due principally to the skill of the advertisement writer and the artist. The common belief is that "ads" have grown larger, and that more advertising is required to-day for a given result than yesterday. Skill in writing and in illustration is responsible for this delusion. There has been a growth in the size of "copy" only in certain individual lines, while the leading tendency is toward the small "ad," the well-worded, aptly-illustrated economic space. Judicious advertisers prefer to appear often and persistently in print in a brief, convincing manner, rather than to appear only on occasion in large space, crowded with their entire proposition, and thus running the risk of having it merely noticed, not read. Less copy is now used for large space than formerly. The increase in printed publicity is due more to the frequent appearance of small or medium "ads" than to the enlarging of the space occupied. The small "ad" carries more weight now than ever. People are either too busy or too impatient to read the old-time leisurely kind of advertising. The page "ad" to-day in order to be successful by every inch of space must, in most lines of trade, be a comparatively small "ad" as to copy. It is safe to say that while "ads" have not grown larger, larger space is used for little copy now than formerly. The favorite vehicle of publicity of insurance companies is calendars, because they are daily referred to in some conspicuous place. Some companies spend as much as $20,000 annually for calendar publicity. Almanacs are chiefly in favor with medical houses, because they have a more complicated story to tell, that can best be sandwiched in between contents for periodical reference. Some houses circulate more than two million almanacs yearly, and one house in particular claims an annual edition amounting to twenty-five million copies. Nearly all the larger medical companies maintain printing plants of their own to get out their editions economically and satisfactorily. The catalog of a single house measures over a thousand pages, on which 75,000 different articles are described; in another modern catalog no less than 100,000 items are listed for sale. The success of modern advertising in bringing the producer and the consumer together, without the interference of middleman's profit, has benefited the consumer with a better quality of goods at a lower price, and the producer with larger profit growing out of small margins on big sales. Yet another benefit of the direct from maker-to-user advertising is the growing desire to tell the truth in print and back it up with the goods. It is not exactly a moral triumph, since the truth is told not for truth's sake, but for profit's sake—it having been discovered that continued lying is unprofitable—but it is a triumph for modern advertising, removing as it does

the last vestige of the old-time taint of nonreliability. The modern idea is to advertise a thing just as it is, so that the consumer will receive the thing exactly as represented. The argument is that when this point is not observed the confidence of the consumer is destroyed, and hence his patronage is forfeited. Nevertheless, at the present stage advertising concerns itself merely with the merit of things, leaving the demerits unsaid. It is honest in what it chooses to say, and dishonest in what it prefers not to say.

The craft has created many new employments besides the writer, the artist, the manager and the agent.

The capital invested in window display amounts to 750,000 store fronts in the United States fitted with plate glass at an average cost of $100 per front, or a total of no less than $75,000,000, not figuring the value of the goods displayed or that of the time of the men who do the trimming.

The window trimmer, who is usually a card writer also, has a national organization of his own numbering 1,500 members. His salary ranges from $18 to $50 a week, and sometimes exceeds that figure.

The letter broker plies his underhanded trade of selling, buying and renting letters, received in answer to "ads," chiefly with unscrupulous mail order houses. Few letters are sold outright, the custom being to rent them at the rate of $4 for each hundred thousand, with a rising scale in price governed by the recency of the date and the number of originals in the lot. In the medical, financial and publishing line there are a surprising number of prominent houses who are in the dishonest habit of publishing as testimonials of their own goods letters received in answer to the advertising of others. Letters from speculators in response to discretionary pool "ads" are thought to command the highest rental, and sharpers looking for victims have been known to pay as high as $1,500 for 50,000 such copies. Letters from debilitated persons in response to the efficacy of some remedy or cure hold the record for tenacity of usefulness, and are used over and over again by dozens of different concerns selling dozens of different remedies. The public is to blame itself for this shameful imposition on its credulity, since the letter brokerage business would never have been possible were it not for the silly testimonial habit of consumers.

The "ad" models are mostly recruited from the ranks of pretty women, or, rather, women who know the art of looking well and making the things they advertise look well. The payment ranges from $2 to $5 a pose.

In outdoor advertising England has the honor of being the pioneer, fully a generation in advance of us. This has not prevented us from outstripping her completely, not only in display and design, but in scope and diversity as well. More than $50,000,000 is annually invested in billboard posting in the United States. The sign business is largely increased through the breweries furnishing saloons with signs. In New York City alone a round $3,000,000 is yearly paid for new signs. The street railways of the United States carry an annual investment of $2,000,000 in car "ads," which are controlled by a few companies, the largest supplying the advertising for 14,000 cars in 100 cities. The "sandwich" men, so-called because they are sandwiched in between two boards carrying display "ads," and of which New York City alone boasts a regiment of 1,200 faithful regulars, are to outdoor advertising what the army of 10,000 professional demonstrators are to printed advertising. Poster "ads" vie with street car "ads" in picturesque effect, and in some countries, like France, they represent the quintessence of art illustration for commercial uses. P. T. Barnum originated the use of posters in this country as early as 1840, but the commercial poster did not appear here until after the Civil War, tho posters of art merit were known in France as early as 1836. To Cherèt, the father of the modern poster, who made his first hit in Paris in 1867, belongs the honor of the artistic finish and power in the poster advertising of to-day.

No field of modern advertising is

more typically American and commercially important than that of the mail order business in conjunction with the follow-up system. Vast quantities of consumption goods are annually disposed of through mail order houses, the larger number of which are essentially middlemen between the consumer and the producer. The most enterprising of mail order concerns make it a policy to create a fine reputation by selling some one thing of superior quality and at a lower figure than any other competitor, and to rely on the patronage thus secured for the disposal of other articles. The requirements for success in the mail order business are very exacting. A thorough knowledge of advertising is the first essential, and even then mistakes are bound to happen, since the publications that have paid other concerns in the same line often disappoint the newcomer. The fault may lie in his advertising copy, or the mediums chosen may not be the proper ones. Either one or both of these conditions may bring the advertiser a vast amount of replies and inquiries, only a few of which lead to sales. The fault sometimes is in the deficient service rendered by the advertiser to actual purchasers, for unless deliveries are as prompt and regular as clock work, and the values at least as good as can be had across the counter, no mail order house can exist.

The follow-up system, as it is termed, consists of a series of cleverly written and aptly designed postal cards, novel folders, *fac-simile* letters, booklets, brochures, catalogs, etc., forming a veritable battery of advertising artillery, with which the customer is bombarded at regular intervals, following a general campaign schedule. This system, which is used in general advertising as well, is fit to promote the sale of anything from a Yankee notion to a battle ship. This is the proper manner of operation: You are a manufacturer or a mail order house disposing of manufactured articles—you are that for argument's sake, of course—and you have 5,000 steady customers, say, on each of whom you are spending a dollar annually in the shape of salaries for two salesmen to call on them. You substitute the two salesmen with a follow-up system that enables you to call by mail on every one of your 5,000 customers with a clever, striking message twenty-six times a year. The expense remains the same, but the result is pretty certain to be in favor of the printed matter. Let us suppose that you receive "straight" orders from ten per cent. of your clientage, and trial orders from twenty per cent., but five per cent. of which may be relied upon as permanent trade. This makes a direct result of 750 orders, and indirectly the way has been prepared for your salesman's staff on a body of 4,250 prospective customers, most of whom can be induced to buy from you on personal solicitation because the follow-up campaign has educated them on the good points of your goods. You turn the remaining eight salesmen on your staff lose upon these customers, and they secure thirty per cent. of them, so that, all told, you will have in hand orders from more than two thousand customers at the year's end,—a result you could not possibly reach simply by retaining your full quota of ten traveling salesmen. You dispense with two salesmen for the privilege of "talking shop" with all of your customers every other week at the rate of four cents per time per customer. Properly conducted such a follow-up campaign will be found to be profitable in almost all cases, and not infrequently it has been known to pay better than the addition of salesmen to double the amount of the cost incurred by it. It is the dogged persistency of this system that enables you to conquer obstacles that are unsurmountable by the old method. It is the constant dropping of the proper say at the proper time—same place, same date—that finally wears away the stony crust of indifference, producing a favorable impression inducive to new business.

New York City.

Literature

Historical Puzzles

In these twelve studies of historical mysteries* Mr. Lang does not claim to be quite sure that he has offered a definite and certain solution of any of them; he sums up the evidence on both sides and submits the case to the public. This may spring from a tender and over-scrupulous conscience, or it may be an artful scheme to flatter his readers into the notion that they are wiser than they really are. However, he generally indicates pretty clearly that he has views, altho he is perfectly satisfied to let these problems continue problems, as they have been for centuries. After all, their secrecy is perhaps their greatest attraction; the raising of the veil might disclose nothing very romantic. And the first two articles, *The Valet's Tragedy* and *The Valet's Master,* in which Mr. Lang, if he does not state directly, at least insinuates, that he has discovered the Man in the Iron Mask, would, if the author's hypothesis be correct, lead to the conclusion that the world has been making a great ado about a very small matter. It was bad enough to have to admit that the state prisoner of Pignerol, the Isle Sainte Marguerite and the Bastile was *not* a son of Mazarin and Anne of Austria, or a twin brother of Louis XIV, or the real Louis XIV himself, or the Duke of Monmouth, or Molière; but just a mere Mantuan intriguer. Still the proofs identifying him with Mattioli appeared to be irresistible, and the romantically inclined were compelled to accept the evidence. And now it seems he was the poor servant of an obscure Huguenot nobleman! Mr. Lang is, as usual, marvelously ingenious, but, in this case, decidedly, not convincing; however, he does give a shock to our confidence in the claims of Mattioli.

While all the articles bear the stamp of Mr. Lang's almost impeccable erudition, charm of style and a humor that sparkles on every page and never wearies, perhaps the most remarkable are the "mysteries" of *James de la Cloche* and *Amy Robsart.*

That the James de la Cloche who made his appearance at the Jesuit college in the Quirinal on the 11th of April, 1688, was the son of Charles II is beyond doubt. The letters of the English monarch in the archives of the Gesu show that he was summoned to London, where he stayed a short time with his father, and that, on the request of Charles, he received 800 *doppie* (about $3,000) from the General of the Jesuits to defray his expenses on the return journey to Rome. After this James de la Cloche disappears, and there is no further authentic mention of him to be found anywhere.

But some months later a young man turns up at Naples who claims to be a son of the King of England; he is arrested, searched, and 200 *doppie,* several jewels and documents, apparently showing that he is what he claims to be, are found on his person. The late Lord Acton, who was much interested in the subject, regarded the James de la Cloche of Naples as an imposter. Mr. Lang holds that the arguments on both sides of the question may be evenly balanced. We venture, with much diffidence to offer a solution of the enigma of the first James de la Cloche's disappearance. Suppose (among so many hypotheses another one does not matter) that the true James was murdered and robbed on his way to Rome by the false James, and that the false James afterward made use of the remaining *doppie* and the papers to prove he was the true James.

In *Amy Robsart,* Mr. Lang is the first writer to show, as far as we are aware, that Elizabeth was in as equivocal a position with regard to her death as was Mary Stuart in regard to the murder of Darnley. If Sir Walter Scott had been as patriotic as he was chivalrous he might have constructed a romance of Cumnor Place in which Mary would have been amply avenged on "her sister and her foe." However, Mr. Lang ab-

* The Valet's Tragedy, and Other Studies. *By Andrew Lang.* With illustrations. Longmans, Green & Co.

solves both Leicester and Elizabeth from any connection with the death of the unfortunate Amy.

The *Shakespeare-Bacon Imbroglio* has become such a weariness of the flesh to people on this side of the Atlantic that, to many of them, Mr. Lang's discussion of the subject, acute, logical and conclusive tho it be, will seem like a waste of good literature.

Greek Sculpture

ANOTHER beautiful book on Greek sculpture! Nothing is lacking on the publishers' part. To say nothing of the excellent paper and printing, the illustrations surpass anything that we have had in this line, both in quantity and quality. There are thirty-one full-page plates interspersed in the text, and at the end of the volume are forty more plates, containing one hundred and thirty illustrations in smaller form, only three of which are not from photographic reproductions.

The title of the book reveals that it is in no sense an ordinary handbook or history of Greek sculpture. It does not claim to do somewhat better what has been so often done and well done in English, French and German. It is rather a discussion of principles which underlie Greek sculpture. The first part, of 101 pages, about one-third of the book, is by no means easy reading, but is in some respects the most interesting and important part. A good example of the author's close reasoning may be seen on page 24. He has gone deeply into the philosophy of sculpture, and in particular of Greek sculpture. His judgments may sometimes be disputed, but no one can deny that he has profoundly thought.

The description of the technic of the Parthenon frieze, in which so many planes are produced in the total small depth, is clear and incisive. The distinction between the dreamy pathos of Praxiteles and the fiery energy of Skopas is well set forth. He calls the former's Hermes "Hermes the Dreamer" (p. 273) and rejects the idea that he is in any sense part of a group. The child Dionysos does not interest Hermes in the slightest. The restoration of him dangling a bunch of grapes before the child he thinks a profanation.

* GREEK SCULPTURE: ITS SPIRIT AND PRINCIPLES. *By Edmund von Mach.* Boston: Ginn & Co. 1903. $4.00.

Pergamon Altar (Reconstructed). From Von Mach's "Greek Sculpture." Ginn & Co., Publishers.

The author exercises independent judgment, and does not overcrowd his book with references; he has, however, neglected none of the authorities and worshiped none. His explanation of some features on the ground of technical reasons seems sometimes more ingenious than plausible—*e.g.*, the contention (p. 113) that the hair of the "Apollo" of Tenea "hung down the neck long and loose" because it was not "possible that the thin column of the neck could hold up the heavy weight of the head." Did not the early Greeks *wear* the hair long? The broadening of certain copies of Polykleitos's Doryphoros head at the back is explained as "a labor-saving device of the Roman stone-cutter, who did not care to carve the ears standing out from the head. The skull is therefore broadened and the ears are not undercut" (p. 255). But does not the bronze bust at Naples show the same broadening of the head as the marbles?

The chapter entitled "The Human Body," in which is described the art of Polykleitos, whose limitations make him schematic and dull compared with Myron, so full of force, and especially with Lysippos, who is his beau ideal, may be singled out for especial praise.

Lysippos is extolled as follows: "This Apoxyomenos is, if one is permitted to stretch the term, the first real statue in the round." Earlier (p. 114), it is said: "The Strangford 'Apollo' is really the first statue in the round deserving the name, even in its most modest application."

The claims set up for Naxian, Chian, Samian, Parian and Dorian schools, which have caused much wrangling among the authorities, are disallowed.

The author is a master of felicitous phrases. In speaking of the advance in technic in the Acropolis figures, he says (p. 152): "The earlier sculptor conceived his task to be the carving of a human figure which happened to be draped, the later endeavored to show the drapery which happened to be worn by a woman." In speaking of Polykleitos (p. 251), he says "his Doryphoros was not to be a man, but the body of a man. To-day we are not much interested in a mere body—we want the man." Of the same sculptor, he says (p. 260): "He began with the 'head' and neglected the 'heart,' he paid more attention to things as they are than as they appear to be," which latter is, of course, the duty of the artist. His phrase, "Autumn Days," for the period after Lysippos, is felicitous, suggesting the glorious fruits, the Apollo Belvidere, the Venus of Milo, the Nike of Samothrace and the Pergamon sculptures.

One may, of course, challenge some of the positions of the book. The statement (p. 145): "Not even Roman copies of this period (viz., of the Acropolis maidens) are extant, for Roman taste did not appreciate the earliest attempts of the Greeks." But certain Romans are said to have had a sort of pre-Raphaelite liking for works of Bupalos and Athenis, which belong to the very period referred to.

The author couples (p. 151) two heads as closely related, Plate ix, Fig. 4, and Plate p. 144. These two heads were long ago so associated by Winter, but Lechat and others then pointed out that the relation between them was mere contrast. The former is in line with the long series of which she is the best in execution, and has the "archaic smile" toned down, but that she still belongs to the series is shown by the eyes, not set in deep sockets, but protruding, and hardly held in by the thin eyelids; while the latter has eyes set deep back in the skull and inclosed by thick fleshy eyelids. Her mouth shows a feature, unique among all the Acropolis maidens, of a distinct pout like that on the mouth of the yellow-haired youth in the room next to her, called *le frère de la petite boudeuse*. One statue stands deep in the old tradition, while the other is in open revolt from it.

In the description of the west gable of the Parthenon, the author appears to ignore Sauer's careful examination of the horizontal cornice, on which he found beddings for figures enough to include nearly all the Olympian gods. In his hope that the central figures of the east gable "may some day turn up again, perhaps in a museum, where they have passed unnoticed," the author probably stands alone.

A few errata may be noticed. "Agelaadas" is probably designedly used, instead of Agelaïdas, since its use is constant.

Page 238, second line from bottom, read *pediment* for "frieze." Page 217, first line, read Pl. x, Fig. 1, for Pl. x, Fig. 2. Page 347, third line from bottom second column, *Pl. xxix,* for "Pl. xix."

What is meant by the statement (p. 336) that Polykleitos is seen by the Oxyrhynchos papyrus "to have been active as a sculptor as early as the fifth decade before Christ, and perhaps even earlier," is difficult to see, for if we change "decade" to "century" we have the possibility of Polykleitos working in the sixth century, which can hardly be meant.

In the list of authorities the "given" names or their initials are usually added. Why Murray, Frazer and others should be excepted one does not readily see. The rule of greater notoriety will not hold, for Perry lacks the addition, while Brunn, Collignon, Furtwängler and Michaelis have it. F. Sellars should be E. Sellars.

Horticultural Romance

Charles Dudley Warner is responsible for the statement that "women always make a muss in a garden." It is impossible to say whether he referred to the sad incident connected with the first lady who "made a muss" in the first of all gardens, or to the innumerable sparrow-spirited females who have of late made a sort of literary industry of gardening. In any case we have been overwhelmed with daintily bound records of their floral experiences. After "Elizabeth's Garden," which was really a sensible adventure in herbs and flowers, all manner of "Judiths," "Stellas" and "Amelias" undertook similar experiments. None of them stirred the soil deeper than a hair pin would reach, but they all wrote brave chapters upon killing bugs and pruning rose bushes. They even represented themselves as accomplishing miracles with honest little plants beyond the skill of the most experienced gardener. They planted more in these small note book paddocks than a ten-acre field would support, and everything sprouted, grew, blossomed phenomenally. Meanwhile, each smeared, sweating, thin breasted gardener goes about with her skirts tucked up, flirting with the hoodwinked reader. The garden is simply her romantic background. She rose with the sun in the morning and ogled him off to the woods in search of ferns for her garden; at evening she coaxed him through her alyssum bordered walks and flowering hedges to the boat on the river, where she confided the unutterable secrets of a woman's soul, and which have no more to do with horticulture than figs have to do with prophesy. But the victim could not see it. Every man who read one of these fallacious volumes is said to have fallen in love with the grimy fingers of the pretty gardener, with her freckles and sun burnt hair, altho common sense proved that both the heroine and her flowers were fakes. It was then that the sane, old married public begun to call aloud for a man with a garden of his own, where no Eve could enter to "muss;" and now, after a lapse of time that can only be attributed to his timidity, a man does appear, fully equipped with a garden, a mind and an imagination.* Therefore he does not spend his time digging and showing off like a tomtit before the reader. The Garden is his text for a series of interesting chapters upon topics which vary from women to religion, from flowers to philosophy. And evidently he is not so much concerned to display the green and blossoming glory of his garden as he cares for the meaning of things, the suggestions that tempt his imagination with a sort of poetic fragrance. Nor are his reflections pedantic, but they are like the gentle musings of one who walks quietly in a familiar place, reminiscent, humorous, philosophical. Still one can see that he is accustomed to floral companionship, since he admits that his tulips are mixed in colors. This is a negligence no lady gardener would confess, for she invariably goes by the catalog and plants them in a rainbow order around the entire circumference of her horticultural imagination. But the peculiar charm of the volume lies in the fact that the author is familiar with the thought and flora of many foreign coun-

* Garden Mosaics. *By Alfred Simson.* New York: D. Appleton & Co. $1.00.

tries. Thus, while he compares occidental religion with Oriental philosophy, he interpolates a comment upon the difference between the *Ipomoea rubrocoerulea* and the same blue "day stars" in his own English garden. Altogether, it is a volume worth reading and worth preserving for a second reading.

The Dynasts*

THE poetry of Thomas Hardy has been recommended recently as a cure for pessimism, on the homeopathic principle of "like cures like." His latest poem is "A Drama, in Three Parts, Nineteen Acts and One Hundred and Thirty Scenes." Of course, such a play is not intended for representation upon any stage. But what is a drama good for if it is not to be acted? The "closet-drama" does exist, but Mr. Hardy's book is of epic dimensions. The present volume contains only the First Part of the play, yet it consists of 228 pages. Its subject is the "Great Historical Calamity brought about some hundred years ago."

Mr. Hardy repudiates "all the mythologies, including that of 'Paradise Lost,'" and says:

> "The abandonment of the masculine pronoun, in allusions to the First or Fundamental Energy, seemed a necessary and logical consequence of the long abandonment by thinkers of the anthropomorphic conception of the same."

Yet he personifies certain Intelligences —"The Pities," "Spirit Sinister," "Spirit Ironic," "Spirit of the Years," "Spirit of the Earth" and "Two Recording Angels"—one more than we are accustomed to in our Christian cosmology—and in their dialogs and choruses they speak of "the Immanent Will and Its designs" quite in the spirit of the Hebrew of old, in spite of the use of a neuter pronoun.

How does the agnostic poet differ from the devout race, who dared not use the name of Yahveh? The "Unspeakable" and the "Unknowable" are not so far apart. In fact, Mr. Hardy has often reminded his readers of the Jewish prophet Jeremiah. In the fore-scene of the Overworld the weird idea of a former poem of the author is reiterated that God made the world—but has now forgotten it:

> "SPIRIT OF THE PITIES:
> "Why doth It so and so and ever so,
> This voiceless, viewless turner of the wheel?
> "SPIRIT OF THE YEARS:
> "As one sad story runs, It lends Its heed
> To other worlds, being wearied out with this;
> Wherefore Its mindlessness of earthly woes."

The human actors, Napoleon, Pitt, Nelson, King George, are less interesting and really less like human beings than the "abstractions," called "Intelligences," floating over their heads, and their dialog is less dramatic.

The First Part closes with the Battle of Austerlitz, leaving Napoleon triumphant. The sinister voices of the spirits, however, mutter ominously of his final defeat. The last scene is the death of Pitt. "The name of his disease is Austerlitz." The viewless "Voices" chant a hopeless requiem—and the book ends thus. The scenes where Nelson and where Pitt die ought to move us, but they do not; the play is too dreamlike and its heroes too shadowy.

Olim Meminisse

As a record of his early struggles, Mr. Trowbridge's autobiography* is as entertaining as a novel. Indeed, in its sense of the romance of reality, it is not so very different from such compositions as Mr. Howells' "Modern Instance," or "The Minister's Charge," tho the comparison hardly extends to the character of the hero.

Mr. Trowbridge was born in Ogden, N. Y., in 1827, a date which makes him a veteran of American letters, and was brought up there on his father's farm, which was one of the pioneer settlements of the region. After a very indifferent schooling and a few seasons of teaching on his own account, he burnt his ships behind him and came to New York in 1847 to try his fortune in the republic of letters. He was then nineteen years old. Since that time he has lived entirely on the produce of his pen.

* THE DYNASTS. *A Drama of the Napoleonic Wars. By Thomas Hardy.* New York: The Macmillan Co. $1.50.

* MY OWN STORY. *By J. T. Trowbridge.* Boston: Houghton, Mifflin & Co. $2.50.

But what is perhaps most remarkable in this rather remarkable career is the fact, to which he calls attention himself, that it is not as a reviewer nor yet as an editor that he has made his way, but as a free lance and almost exclusivey by original production. The only exceptions are his brief editorship of *The Yankee Nation* in 1849 and of *Our Young Folks* in 1870. In fact, of hack work in the strict sense, he seems to have done almost nothing, unless "The South," which he was hired to prepare in 1866, on the condition of the slave States after the war, be accounted such.

When he first came to New York he had already written a good deal of verse, some of which he had published in the local papers. But on the recommendation of Major Noah, editor and proprietor of the *Sunday Times,* he began his professional career by writing stories at a dollar a page, or two dollars and a half a chapter. On this magnificent remuneration, eked out the first winter by the engraving of pencil cases, he managed to support himself until in the fall of 1848 he removed to Boston. There he secured almost immediate recognition and success, first as a writer of stories and sketches and then as a novelist. The establishment of the *Atlantic Monthly* in 1857 gave him, like many another American writer, an excellent market for his wares, and what was perhaps equally important, made him acquainted with such men as Lowell, Longfellow and Holmes, his recollections of whom, together with Emerson and Walt Whitman, add not a little to the significance of his memoirs. It is interesting to notice that he is, with one exception, the sole surviving contributor to the first number of the *Atlantic.* But it was for *Our Young Folks, Saint Nicholas* and the *Youth's Companion* that he wrote the work by which he is in all probability most popularly known—"namely, a style of story that should not be bad as literature, and which should interest at the same time young and old."

Toward the close of the book Mr. Trowbridge raises several interesting questions, especially the following: What difference, he asks, would it have made to his gifts, had his early training been more thorough and academic? But surely such a question, while important in the abstract, is one impossible, not to say ungrateful, to answer in a particular case. We can only suggest that, while literary tradition is of inestimable benefit in many ways, yet literature, if it is to live at all, must be constantly freshened and renewed from without. And how can that be done better than by turning upon it every now and then a stream of lively and undulled experience? At all events, in regard to this one book there can be no doubt that it owes it interest very largely to the unconventionality of its author's career.

The Story of a Labor Agitator. By Joseph R. Buchanan. New York: The Outlook Co., $1.25 net.

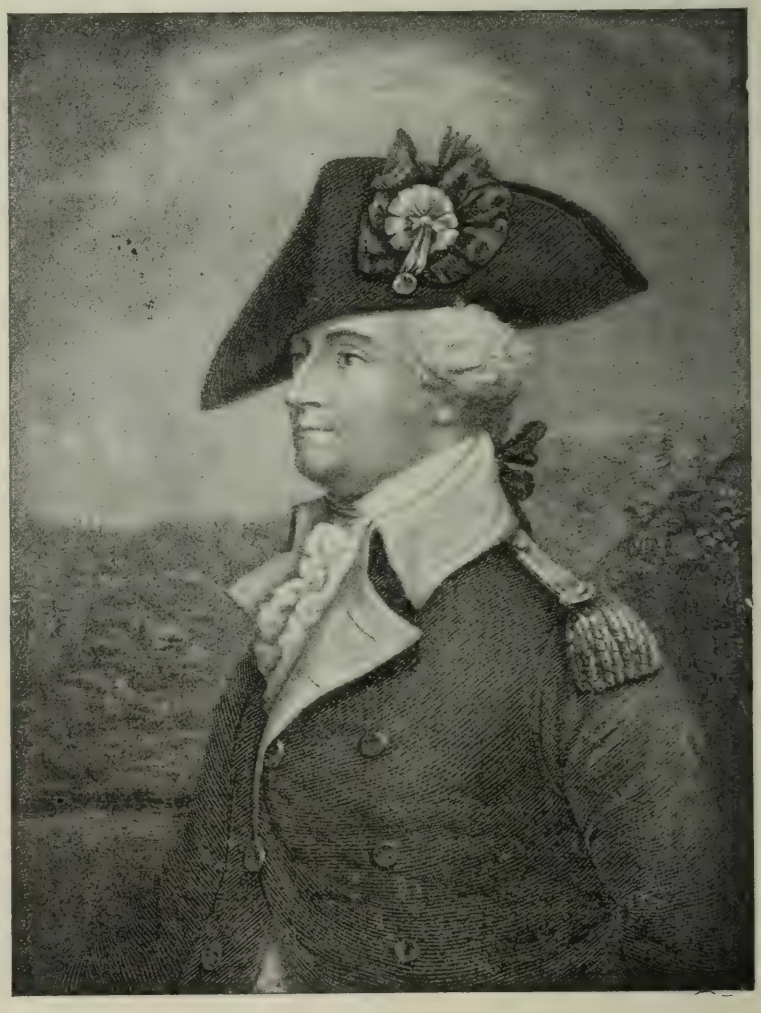
Those persons who innocently imagine the labor leader to be one who waxes fat over the spoils wrung from his dupes, the organized toilers, may read with profit Mr. Buchanan's story of the storm-and-stress period of his life. They will learn that for at least one labor leader the recompense was privation and suffering. It is a stirring and deeply interesting tale. Mr. Buchanan had his first experience of a labor dispute in Leadville during the miners' strike in the fall of 1880, and the active part he took in that trouble drew down upon him an emphatic warning from an alleged citizens' committee of 100. In the remarkable strike of the unorganized workmen in the Union Pacific shops in May, 1884, he bore a conspicuous part, and in the following strike on the same railroad system, three months later, he had charge of the negotiations and brought about a peaceful solution of all difficulties. The stirring times of the strike of the Denver & Rio Grande shopmen, principally at Denver, in the summer of 1885, are recorded at some length. Repeated threats of hanging him were made, one prominent newspaper daily inciting its readers to do the job, but he stuck to his post as adviser and director of the men. In December, 1882, he began the publication in Denver of the *Labor Enquirer,* which he continued for more than four years, removing to Chicago in February, 1887, and

continuing the publication until August, 1888. The difficulties and struggles of a labor editor operating under a law of diminishing returns are fully recounted. More than once the paper was on the point of perishing for want of sustenance when some providential succor arrived. But at last the adverse factors won, and the *Labor Enquirer* was numbered with the hosts of labor and radical publications that have failed from lack of support by those whose interests they represent. The charm of the narrative lies largely in the simple, sincere and straightforward manner of telling it. The book is an important and significant "human document."

Porto Rico: The Land of the Rich Port. By Joseph B. Seabury. Silver, Burdett & Co., 50 cents.

The present book is Number XII in a series entitled "The World and Its People." It is a supplementary reader, and the value of supplementary readers as an important part of the school equipment was long ago acknowledged. A long step forward has been taken in this department of literature since the days of the old New England Primer, which was once the sum of all knowledge to our grandparents. The book is pleasantly written and gives much information regarding the Porto Rican climate, its plants, minerals, animals, fish, insects, etc. The volume is fully illustrated.

Hat Sellers. From "Porto Rico"
Copyright, 1903, by Silver, Burdett & Co.



Woman's Unfitness for Higher Co-Education. By Ely Van de Warker, M.D. New York: The Grafton Press, $1.25.

This is a violent attack on the co-education of women and its defenders, in which the author uses as his chief texts the articles, *pro* and *con,* which were published on this subject in THE INDEPENDENT a year ago. We cannot see that he adds anything to the discussion except vituperation, and the authorities of Syracuse University in particular may find good grounds for a libel suit against him. Dr. Van de Warker restates the usual charges against co-education: that it is adopted and maintained because it is cheap and gives larger enrollment; that co-education injures the health of women and unfits them for marriage and maternal duties; that they waste their time in love-making, which leads to early marriage or worse; that the kind of education is not suited to woman's needs and capabilities. The author's standpoint is that "woman is all sex," a theory which, we venture to say, is responsible for more vicious social customs in the history of the world than almost any other. There is no help for it; if women are the weak yet dangerous creatures the author thinks them, we must go back to harem life, with some additional restrictions in regard to thickness of veils and shopping privileges which the experiences of the Turks have found necessary. By the method of consulting medical reports and collecting newspaper scandals on boarding-school habits and the vice of the *pensionat* a

book could be written which would contain quite as much truth and be just as false as a whole as this *exposé* of the evils resulting from co-education. We would call the attention of the author to one point as to the extent of the damaging influence of co-education which he seems to have overlooked; that the professors and even the presidents of women's colleges, such as Alice Freeman Palmer, Caroline Hazard, M. Carey Thomas, for example, have many of them been educated at co-educational colleges, and their manners and morals are quite likely to have suffered from the "contaminating atmosphere" of these institutions, in which case it is not at all safe to send our daughters to such schools as Bryn Mawr and Wellesley, where they would be under the influence of such co-educated alumnæ.

Anthony Wayne. [Historic Lives Series.] By John R. Spears. New York: D. Appleton & Co., $1.00 net.

A very readable account of the life of the daring Revolutionary general. Wayne's foresight, judgment and tactical skill are placed in a better light than that in which he is popularly viewed. Impetuous no doubt he was, when ready for action; but he had a high regard for preparedness, and he calculated situations carefully The attack on Stony Point was preceded by a studied preparation, in which the pettiest details and remotest contingencies were considered. The victory of Fallen Timbers, on the Maumee, whereby he crushed the power of the Indian tribes, was made possible only by a long course of drilling and schooling his men in the conditions of Indian warfare. Yet it is not explained by the author how Washington, who knew Wayne well and had trusted him with important enterprises, including that of Stony Point, could have been persuaded by envious officers, in 1792, that his subordinate was "brave and nothing else." That the President had come to entertain a poor opinion of Wayne is certain. He would have given the command of the Indian expedition to "Light Horse Harry" Lee. Finally, however, in April, he appointed Wayne, declaring that he had "many good points as an officer, and it is to be hoped that time, reflection, good advice, and, above all, a due sense of the importance of the trust, will correct his foibles, or cast a shade over them." His action, it is needless to say, was amply justified by the victory of Fallen Timbers, which gave peace to the Northwest Territory for fifteen years.

Anthony Wayne (Spears). D Appleton & Co., Publishers, 1903.

Ritschlianism: Expository and Critical Essays. By James Orr, M.A., D.D. New York: A. C. Armstrong & Son.

Professor Orr appears in these papers as the courteous but determined antagonist of Ritschl and Harnack, McGiffert and Swing. He aims to be fair and tries to recognize freely the merits of those he opposes, but his point of view is so different that despite his endeavors he

neither informs correctly as to his opponents nor hits the mark in his attack. One who has worked himself into the spirit of Ritschl and then takes up Professor Orr will be pardoned if he thinks of the good Professor himself as he reads, "One may spend months over this distinction of Ritschl's" (*i.e.*, between religious and scientific knowledge) "and in the fluctuation and vagueness of his expressions not be sure that he understands him after all" (p. 19). How one can write so sympathetically of the religious and Christian spirit of Harnack's "What is Christianity?" and then try to hold Harnack to the opinion that "Jesus himself does not belong to his own gospel" (p. 123), is indeed a mystery. Similarly, the service of McGiffert, in presenting one of the most realistic and informing pictures of the work of Paul that have ever been drawn, is lost sight of, and the attempt is made to frighten people by assumed consequences of McGiffert's critical principles. It is doubtful if controversy where the general attitude and presuppositions are so different is of any use. A better way to knowledge than the discussion of personal opinions, with its inevitable call to prejudice, is the study of particular questions with whatever light may be thrown on them by whomever is possessed of insight, even tho he be a German, and even tho he confess indebtedness to Albrecht Ritschl.

Shipmates in Sunshine. By F. F. Moore. New York: D. Appleton & Co., $1.50.

This clever volume is a sort of sentimental log-book kept during a sea and sunshine voyage. But it is not written in the offensive *ego* style. The author is apparently the romantic agent of every one else's love affairs on board the ship, and one cannot help wishing that he had been involved himself to the extent of a sigh or a kiss. But with the kindly meddlesome spirit of an elderly matchmaking gentleman, he devotes all his energies to the advancement of the tender passions of all the bachelors and maids on deck. He is the love pilot of their emotions. And, aside from the preposterous yarns with which the story is pieced together, it has the peculiar interest of showing the difference between the disposition and motives of a match-making man and a match-making woman. The former is a philosophical humorist, interested chiefly in the romantic manifestations of adolescent human nature; while the latter sees no further than her partisanship for an especial pair of lovers whom she is determined to coerce into the strenuous bonds of matrimony.

The O'Ruddy. By Stephen Crane and Robert Barr. New York: Frederick A. Stokes Company, $1.50.

"A romance by Stephen Crane and Robert Barr!" It should be a good one, and it is, if wit, pure Irish wit, and innumerable delightful situations count for anything in fiction. *The O'Ruddy* is a young gentleman from Ireland who may be said to have invaded England during what he calls "the age of bullies," with no better equipment than his sword, an impudent tongue and a mind that was the very seat of humor. Never did such shrewd innocence go abroad to seek a fortune; never was ignorance so endowed with wisdom or poverty garnished with a braver, handsomer smile. Now there is a wonderful difference between native humor and artificial wit, and this delightful farce should be appreciated by those who know the distinction. For O'Ruddy's humor was based upon philosophy, and his philosophy is founded upon the experience of all the sons of Erin. It comprehends romance, history, tradition and the ends of the earth with an ease that could only come through the free and conscienceless use of his happy imagination. He had the alarming, delightful faculty of lying truthfully, which is a gift none but the Irish possess.

Drawing-Room Plays. By Grace Luce Irwin. San Francisco: Paul Elder & Co., $1.24.

This volume of short, light comedies will be welcomed by many amateur players who have difficulty in finding something "to fill the bill." There are seven plays included, none of them requiring many actors or elaborate stage settings, yet all of them bright and interesting enough to please the ordinary audience.

Literary Notes

"The Burlington Magazine for Connoisseurs," a scholarly written and sumptuously illustrated monthly devoted to the Fine and Applied Arts, is now issued in this country by the Macmillan Company at $12.00 a year.

...."Who's Who" for 1904 has just been published by Macmillans ($2.00). It contains some 17,000 names of distinguished persons in all countries, and is invaluable for addresses and brief biographies.

...."Suplee's Mechanical Engineer's Reference Book" (Lippincott) is a very comprehensive book of mathematical tables and formulas, and information on strength of materials, engine testing, electrical work, etc., included in some 900 pages and still not too large to pocket.

....Those who are interested in the arts and crafts movement will find in the February number of "The House Beautiful" a good survey of recent work. This magazine is devoted to house building and house making considered both from the artistic and practical standpoints. It is published by Herbert S. Stone, Chicago.

....Students of Western history will be glad to know that a series of annotated reprints of Early Western Travels (1748-1846) in the Middle and Far West is about to be published by the Arthur H. Clark Co., Cleveland. The fact that it is edited by Reuben Gold Thwaites, to whom we own the "Jesuit Relation," is a sufficient indication of the character of the work.

....G. P. Putnam's Sons publish a new and enlarged edition of James Gall's "Easy Guide to the Constellations." Five additional plates have been added, so as to include all the constellations of the Zodiac and make the book more adaptable for Southern Europe and the United States. Excellently arranged, and copiously illustrated, it should prove a valuable handbook for all who want to become familiar with the stars.

....A new and very much expanded edition of Wright's "Early Bibles of America" is being published by Thomas Whittaker, of this city. Since the first edition of this book appeared much valuable material has come into the author's hands. All this has been made a part of the present volume in sixteen added chapters. Several more of the rare Saur Bibles have been located, and to these reference is made in comprehensive tables contained in the book. The work of Mr. Wright has been done in a painstaking manner, and his information has for the most part been obtained at first hands, he having visited and inspected nearly all the collections of Bibles, not only in this country, but also in Mexico, for this purpose.

Pebbles

The Bride: "We have come to be married." *Modern Minister*: "Ah, yes. With or without?" *The Bride*: "What?" *The Minister*: "Obey."—*Town Topics.*

....The shade of the last wife of King Henry the Eighth stood on the bank of the Styx. The ghost of Edward the First still-hunting for a conveyance stepped upon her train. "Pardon me, Madam," he said, "I thought this was the limited." "You're the limit Ed.," she haughtily replied. Charon shouted, "Express packet for Plutotown! Come along, Lady." "I'm waiting for the fast male," answered the Queen of England as the ghost of her spouse came in sight.—*Yale Record.*

...."I have discovered the source of life!" The new professor, who had only been drawing a salary for three days in the great university, flourished in his hand a quart bottle of protoplasm as he spoke, standing upon the threshold of the president's office. That gentlemen frowned. "If that's the best you can do," he observed "I'm afraid you'll lose your job."

"But, my dear sir," remonstrated the new professor, "is it nothing to discover the source of life?" And the president smiled satrically as he replied: "Absolutely nothing, sir, in these days. Why, only this week the source of life has been discovered four times, without attracting absolutely any attention at all from the papers. Young man, unless you can discover something new and startling enough to advertise this college in the proper manner, I wain you that your days are numbered."—*Life.*

PARENTHETICAL REMARKS.

A well known Indiana man
One dark night last week
Went to the cellar with a match
In search of a gas leak.
(He found it.)

John Welch by curiosity
(Dispatches state) was goaded;
He squinted in his old shotgun
To see if it was loaded.
(It was.)

A man in Macon stopped to watch
A patent cigar clipper;
He wondered if his finger was
Not quicker than the nipper.
(It wasn't.)

A Maine man read that the human eyes
Of hypotism were full;
He went to see if it would work
Upon an angry bull.
(It wouldn't.)

Editorials

Spencer's Japanese Blunder

IMMEDIATELY following his death Herbert Spencers's own voice has given a sudden blow to the philosophic canonization which we were all eager to give him. It comes through the publication of a letter of his written in 1892 to the Japanese statesman, Baron Kaneko, a letter which he stipulated should not be published till after his death, as he did "not desire to rouse the animosity of his fellow-countrymen."

Baron Kaneko is one of those Japanese who came early to this country. He graduated at Harvard and had a directing voice in the organization of the Japanese Parliament, being the first Secretary of the Upper Chamber. He was a great admirer of Herbert Spencer and visited him in London in 1892. He found that Mr. Spencer's views as to the policy of Japan in relation to intercourse with foreigners were utterly diverse from his own, and after no little discussion the English philosopher wrote him the extraordinary letter which is now made public.

In it he lays down first the general principle that "the Japanese policy should, I think, be that of keeping the *Americans and Europeans as much as possible at arm's length.*" The emphasis is his own. Now let it be remembered that this had been the Japanese policy for hundreds of years, that it had frozen the islands into a rigid glacial sterility of thought or progress. Then came the opening of the islands by an American naval officer. Then entered a multitude of American teachers of Western science, and a multitude of Japanese youth sought education in Europe and America. The new Japan which is about to resent and resist the dominance of Russia is the product of this new Western influence, and yet only twelve years ago Herbert Spencer was so blind as to advise Baron Kaneko, and bid him tell it to the Marquis Ito, that Japan should have nothing to do with Americans or Europeans! The philosopher was no prophet, and his philosophy had lost faith in the force of truth.

He would, he added, allow no form of intercourse with foreigners except what might be necessary in commerce. No further privileges should be allowed them. To open the empire to foreigners and foreign capital would be "a fatal policy." The foreigners would come in and seize the whole. He would forbid the foreigners to hold property in land, or even to lease land or to reside in any way except as annual tenants. Nor would he allow foreigners to work the mines, nor would he permit foreigners to have part in the coasting trade.

Mr. Spencer's motive in all this advise was generous enough, but it lacked all confidence in the ability of the Japanese to maintain their rights against foreigners. He was one of those who have no faith in the possible generous good faith of foreign nations toward a weaker nation, such as was shown when the privileges of exterritoriality were surrendered under the lead of the United States. He evidently looked upon the Japanese as an inferior race that were unable to meet the conflicts of civilization, but must be secluded to be preserved. It is fortunate that the Japanese statesmen were wiser than he. They invited foreigners by the scores to teach them, and to-day Japan finds Great Britain and America not her tyrants and spoilers, but her strong friends; and it is on her treaty with Great Britain that she depends for protection against the coalition of Russia and France.

On one other point Mr. Spencer gave very curious advice. Intermarriage between foreigners and Japanese he declared "should be positively forbidden." Now the choice of people in marriage is about the most delicate thing for philosophers to meddle with, and Mr. Spencer was not wholly happy in the generalizations on which he based this mandatory utterance. He declared it to be a biological fact that "when mingled varieties diverge beyond a certain degree the result is inevitably a bad one." In

the human race he supported his assertion by the Eurasians in India and the half-breeds in America. Certainly we see nothing of the sort in this country. The mixed races here show a fair average value as compared with the races from which they spring, whether we take the product of mixture between whites and Indians or whites and negroes. Dr. Frissell declares that at Hampton he cannot see that there is any intellectual inferiority of the mulattoes. The mestizos of the Philippines are generally supposed to be superior to the pure natives. But this was not Mr. Spencer's view. His command was to " peremptorily interdict marriages of Japanese with foreigners."

It was quite in accord with Mr. Spencer's position that he expressed his approval of American laws restricting Chinese immigration, in order to prevent " social disorganization." It was a case of theory run mad, a theory which he repeated in his concluding advice: *"Keep other races at arm's length as much as possible."*

If this advice had been followed the result would have been what we see today in China. The armies of Europe would have looted Tokyo as they have twice looted Peking. That is the fruit of an arm's length policy. The advice, happily not followed, was what Milton calls the " distilled quintessence, the pure elixir of mischief."

Morality Up to Date

It seems to be harder for most people to admit that progress is possible in morals than to concede the inevitableness of change in all other human affairs. Economic progress we expect, we even demand. Progress in enlightenment we accept as a matter of course. Even scientific discoveries, that upset long cherished beliefs, we grow accustomed to. But our rules of morality we somehow regard as unalterable.

There are good reasons for our conservatism. The fundamental things of morality are older than human life itself. They are correlated with instincts of self-preservation and of race maintenance that were established before man had emerged from a brutish animal existence. Sympathy, for instance, and pity, notwithstanding the poet's conception of nature as red in tooth and claw, are strong passions of the more highly endowed animals; while fidelity, as exhibited in the dog, is hardly surpassed by the loyalty of man. And even those principles of morality that belong to the social life of human beings, such as the prohibition of murder and theft, are associated with instinct, and rest on eternal right, and no amount of reasoning from grounds of expediency ever satisfies the normal intellect that premeditated killing or deliberate plunder becomes right through the shifting of circumstance. In all healthy natures, also, the abhorrence of lying is so deep that even the pardoned lying of physicians and nurses in cases of desperate illness gives us an unpleasant feeling.

Nevertheless, these fundamental instincts of right are far from being the whole of morality. As society becomes more complex the sum total of relations constituting our conduct necessarily becomes complex also. The world has been forced to recognize a measure of truth in what is called casuistry. Life is so full of shadings, of delicate adjustments, that very few rules can be made absolute and of universal application. Great cruelties have been inflicted by well-meaning men who have tried to mold their fellow beings to one single pattern of moral ideal and conduct. Casuistry, in the good sense of the word—for there is a good sense—is the adaptation of abstract rules to the individual case. The broad-minded jurist will admit that really good law is case law; that is to say, the interpretation of a general legal rule in accordance with the circumstances of the case immediately before the court. Many difficult cases in morals are analogous to difficult cases in law. The right is not to be determined without a conscientious consideration of every circumstance involved.

The chief demand upon moral systems for flexibility and progressiveness arises from the increasing pressure of social, in contrast with merely individual, interests. A scheme of conduct that is good enough for a colonial people, where agriculture is the universal occupation, and a large proportion of the sparse population lives in isolated homesteads, breaks

down in a nation given to vast industrial and commercial enterprises, and composed of millions of human beings, living more and more in dense urban aggregations. In the more primitive state "respectability" is a fairly good index of character and well-doing. Families, tho living at considerable distances from one another, are acquainted, and, being all in practically the same economic circumstances, they cannot conceal their real conduct from one another, or maintain a reputation for respectability that has no substantial basis. In the city life of a commercial nation the connection between right doing and respectability is easily broken down. Men may go through life enjoying the esteem of the community, while engaged in practices that are sapping the very foundations of the social system. They have only to go to church, and make generous contributions to charities, to be regarded as pillars of righteousness, when, perhaps, they are accumulating fortunes by methods that in no wise differ in essential character from those of the highwayman, altho they happen not to have been brought under legal prohibition. The word *respectability* is consequently now beginning to have a bad connotation.

It is facts like these that make ridiculous the attitude of religious denominations which still place the emphasis of condemnation upon those details of individualistic ethics that are associated with the so-called worldly pleasures. We raise no question whatever in regard to the goodness or the badness of card-playing, theater-going, or dancing. If to any man these things are sin, his duty is clear. Let him abstain. But to put these things before those kinds of wrongdoing that are associated in our modern life with a ruthless disregard of the economic rights of our fellow men, with a callous indifference to those principles of liberty and equity for the preservation of which a republican form of government was instituted, and with a willingness to corrupt our political life by bribery or intimidation, is to convert morality itself into a mockery.

And this is not all. The time is coming, if it has not already come, when we must raise the question whether in a highly evolved society it is morally right for individuals of communities to make those irrevocable contracts, or even promises, that may be legitimate when all human relations are of a very simple sort. No man knows to-day, no community knows, whether it will be possible twenty-five years hence, without foregoing that growth which is a part of life, to fulfil obligations too hastily made. This is too large a subject to enter upon at this time. Its scope may merely be indicated. Has a muncipality any moral right to bind itself irrevocably by giving a franchise in perpetuity? Has a nation any moral right to enter into treaty relations that cannot be abrogated by reasonable notice? Has an individual any moral right to take pledges, or to sign creeds, that he may presently discover are bonds which his spirit must burst if he is not to cease to grow in mental power and in breadth of rational interest?

The Teaching of English Literature

We spoke last week of the uncertain, chaotic teaching of English in our colleges and universities, and we referred to the feast of sow-thistles to which our hopeful youth are too often invited under the name of English Literature. The trouble consists largely in the substitution of method for substance. The distinction between secondary and college instruction is something like this: The school teacher is obliged by the necessity of the case to interest himself very largely in method, in the pedagogic side of his profession. His scholarship need not be very extensive, but he must have a thorough knowledge of his pupils' capacities and limitations and of the means whereby his topics may be adapted to their peculiar temporary requirements. The professor, on the other hand, ought to be concerned primarily for his subject as a vital and integral part of human life. It will not do for him, any more than it will for the teacher, to be negligent in the matter of presentation. But his problem is a different one, for whose solution he has to rely mainly upon the infection of personal enthusiasm and example, and upon the vital interest of his subject matter. For this reason his greatest merit will consist in inspiring himself directly with

some branch of that general or universal knowledge which it is the business of the university to dispense; his greatest fault in overlaying his subject and obscuring his own personality in an excessive care for lifeless and impertinent technicalities. And yet obvious as seems this truth, it is probably safe to say that the majority of the academic faculty of our colleges and universities, particularly that part of it which deals with literature, are at present much more anxious in devising *methodenlehre,* ingenious systems or doctrines of instruction, than in giving their own enthusiasm free play and bringing out the living issues of their subjects.

For this mistake there is probably some excuse, tho the results are likely to be no less disastrous. The present is very largely a time of scientific and technical studies, and the temptation to imitate the method of such studies is naturally very great. But there is one thing that the imitators forget in their eagerness to secure for literature some of the prestige that science has been enjoying so exclusively. These scientific and technical studies have all an important bearing upon life; whereas the technicalization of literature, if we may coin the word, only abstracts it hopelessly from life and reduces it to an uninteligent pother about irrelevancies. "There are two roads," says Renan, "which lead to the direct and pragmatical knowledge of things: they are, for the physical world the physical sciences; for the intellectual world the science of spiritual facts, for which I can find no other name than philology." But the analogy, tho popular, is a misleading one; for, while the science of physics, for instance, is identical with physics, the science of literature is not literature at all, but another thing entirely. In other words, the method and subject matter of physics may be said to constitute the science of physics; whereas the method and subject matter of the science of literature are quite different from the method and subject matter of literature itself.

But there is, nevertheless, a proper analogy between science and literature, which ought, if thoroughly grasped, to be as fruitful as the other is sterile. For just as science concerns itself with the application of a special method to a special set of facts or phenomena, so literature concerns itself with the application of moral ideas to life. And just as the study of science consists in the study of this relationship between method and facts, not of the words in which it is clothed, so the study of literature ought to consist in the study of these ideas about life, not of their expression. The study of words and expression is, of course, perfectly legitimate, but it is no more literature than it is chemistry.

In short, literature is the result of a direct personal contact with life, and comprises a particular kind of thought or speculation about life. It is valuable, if at all, as a record of human experience: a compendium, so to speak, of the various opinions that have been held about existence; not as a matter of science or technology, but as a matter of morals in the wide sense of the term. And as every one is obliged in the course of his physical and mental development to repeat the antecedent history of the race, this compendium becomes of the greatest value in the formation and correction of his own vision of things. But above all is that portion of the record which deals with his own civilization inestimably valuable—and at this time particularly, when recent changes of education are throwing the student more and more exclusively upon his own language for a knowledge of the bases of our culture. How vastly important it is, therefore, that English literature should be properly treated—not as a philological puzzle or an exercise in rhetorical analysis, nor yet as a text for the indoctrination of pedagogic theory, but as a direct and original contribution to that most important of all problems, the problem of right living.

Women Chemists

M. Curie has been offered the cross of the Legion of Honor by the French Government for his researches in chemistry, but he has refused it. His reason for this is not because he, like some scientific men, such as Herbert Spencer, thinks that all orders and decorations are improper, but because the same honor was not awarded to his wife. The cross of the Legion of Honor has several times been bestowed on women for services

much less important to humanity than Madame Curie's, and if such work is to be rewarded in this way she is clearly entitled to it. In the long list of her achievements for which she claimed and was granted the degree of Doctor of Science from the University of Paris these four alone are hardly to be matched by any man in recent years: the invention of a new process for the separation of minute quantities of rare substances by their radio-activity; the discovery of a new element, radium; the study of its unique properties; the approximate determination of its atomic weight.

The question is not one of etiquet and precedence, like that raised by Signor Crispi, when he refused to serve the Italian Government as Premier unless his wife was received with himself at court, a favor which Queen Margherita is said to have conceded in these words: "Well, Signor Crispi may bring his wife, but only one of them and always the same one." M. Curie insists on the recognition of Madame Curie, not because she is his wife, but because she as an individual has earned this reward.

We are at a loss to find words in which to commend M. Curie for his stand. We would call him in the conventional phrase a gentleman and a scholar, but for the fact that those who are called gentlemen and scholars do not usually treat women so. The authorities at Cambridge University are "gentlemen and scholars," but when Miss Fawcett passed a higher examination in mathematics than any man in the university, they refused her a degree because she had the misfortune to be a woman; a congenital defect for which nothing could atone. They are "gentlemen and scholars" who in England refused to admit a thoroughly competent woman to the bar on the ground, frankly confessed, that "it would create a precedent"; something that the British are constitutionally averse to doing. They are "gentlemen and scholars" who in some of the universities of this country, as of Europe, refuse to women equal honor for equal work. They are "gentlemen and scholars" who, in California, have just banished women from the diocesan convention of the Episcopal Church.

Evidently M. Curie is a different kind of a gentleman and a scholar from these, and needs some new designation. In the case of Miss Fawcett the Cambridge authorities were obliged to create the new and higher title of "Above the Senior Wrangler," to classify her work. So it appears that the enlarged opportunities for women are developing a new species of *Uebermensch,* male and female, for which our old honorific titles are inadequate.

In this connection it should be noted that an American girl, Miss Milroy, has just received from Berlin University the degree of Doctor of Science, *magna cum laude,* for original work in chemistry; the first time this degree has been given to a woman. In this country, too, a few women have received the degree of Doctor of Philosophy for research in the same field; for work not of the first order, but well up to the average of the masculine recipient of the same degree.

This is interesting because chemistry is one of those exact sciences which were so long tabooed to women. It was once thought that, while women could handle the modern languages with facility and even fluency, Latin and Greek were beyond their limited mental powers. Later the ancient languages were conceded, but the stand was made on higher mathematics. When it was found that women in every college took to mathematics like ducks to water, it was explained that their ability in mathematics implied no more than that woman was capable of walking in her brother's tracks, and she could not be expected to walk alone in an unbeaten path. But the exception of Sonia Kovalevsky proved too much for this rule.

In the sciences it was thought that women might do something in those which were purely observational, like taxonomy, and certain parts of astronomy, but that research in physics and chemistry is an exclusively masculine right. But already with limited opportunities and under hampering restrictions much important work in all sciences has been done by women; enough to show that those who still deny them instruction and shut them out of laboratories, because of their sex, are wilfully robbing the world of knowledge, every fragment of which is too precious to lose.

The Open Shop

THE current discussion of the open shop leaves in many minds the feeling that the conflicting views are irreconcilable. The union spokesmen stand out uncompromisingly for the union shop, while the spokesmen for the employers and the general public are equally decided for the open shop.

One reason for this divergence is that the advocates, when debating in public, are placed in a false position, for in many cases they are practicing exactly the opposite of what they seem to advocate. The employer who supports strenuously the open shop is found employing solely union men, and the unionist who insists on a strictly union shop is found making agreements which recognize what the employers consider the open shop. The explanation is the fact that in making a public argument the advocate brings together the strong points on his side from all situations, especially extreme ones, and creates an abstract situation which nowhere exists; but in going into a private conference for the purpose of reaching a settlement he drops generalizations and endeavors to deal with the situation in hand. Here everything depends on the object to be gained, the evil to be remedied, the mutual confidence of the parties, their previous experience. Many things are taken for granted, several objects are reached indirectly, results are aimed at. The man who in public appears to be irreconcilable is often in a business conference what is called "practical." The public debate has placed him in a false position.

At the same time the debate would show less contradiction if the parties were more careful in using terms. Every one supposes that an open shop is one where union and non-union men are employed together, and consequently one is surprised when he meets an employer who states that his is an open shop, while his workmen state that it is a union shop. This surprise becomes a suspicion of a quibble when the employer goes on to say that, while it is an open shop, he employs only union men. But the surprise soon passes away, for it is evident that a very large number, and probably a majority, of shops where union men are employed are of this character—namely, "open" from the employer's standpoint and "union" from the workman's standpoint. And the supposed quibble also disappears, for there is a real difference, without the proper word being used to express it. Instead of the three terms usually employed—viz., "Union, "Non-union," and "Open,"—there should be four terms—viz., "Closed," "Union," "Non-union," and "Open." The closed shop is one where the employer makes a contract to employ only union men. This is, of course, also a union shop. The open shop is one where the employer does not bind himself on this point. He retains his right to employ non-union men if he sees fit. In practice, however, he may be known to employ only *union* men, in which case the workmen recognize it as a union shop. But in practice he may employ also non-union men, in which case, only, would the workmen admit that the shop is open. Thus it is that from the employer's standpoint the open shop is contrasted with the *closed* shop,—the distinction with him is a matter of contract. But from the workmen's standpoint the open shop is contrasted with the *union* shop.—the distinction with them is a matter of results. The employer who says his shop is open may simply mean that he has not bargained away his right to hire non-union men. His workmen may just as truthfully say that his shop is union, because, as a matter of fact, he employs only union men.

This brings up the practical point that there are so many different ways of settling the question, depending on so many different contingencies in each settlement, that no abstract rules can be laid down in advance. The question of open, closed or union shop is only one of several items entering into a contract and is necessarily treated like every other item in the "give and take" of the bargain. The employer may see it to his advantage to bind himself by contract to employ only union men, because he gets what the lawyers call a "consideration." If the union has a valuable label, like that of the brewery workers or garment workers, it justly demands as a consideration that the shop which gets the label shall be "closed." If an international union guarantees a local union

contract, or itself makes a contract binding a local union, as is done by the Typographical Union, the Longshoremen, or the Bricklayers, it may justly demand, as the means of enforcing its authority, that the shop be closed, and this international guaranty may be a consideration which the employer deems worth a closed shop. If the employer finds that the union will help him to secure men who are more contented and reliable, that also is a consideration. If the union agrees to work only for the members of the employers' association, that is an exceedingly valuable consideration, so much so that it savors of monopoly and injury to the public.

The open shop is like natural rights. It assumes an abstract state of affairs and forces the debaters into irreconcilable positions. It is gotten around or traded off when men "get down to business."

Mr. Chamberlain's Campaign

The activity of Mr. Chamberlain and his friends seems to have been lessened temporarily by the near approach of another session of Parliament. Ordinarily an old Parliamentary hand like the statesman from Birmingham would not be unduly anxious about meeting the House of Commons; but the recent course of his campaign must have given him a more definite impression of the work before him and deepened his sense of responsibility to the British people. At a time when the preferential tariff issue, clear enough in its outline, is complicated by the aftermath of the South African War and the Education bill, it is impossible to attach much importance to the first electoral verdicts on the Chamberlain program; but so far as the recent bye elections go they certainly do not indicate an indorsement of that program. Five constituencies have returned members, two for and three against Mr. Chamberlain. In the London constituencies of Lewisham and Dulwich, the former majorities in these Conservative strongholds were considerably reduced; in Norwich, Mid-Devon and Gateshead the Liberals won by large majorities, one of these seats being formerly held by a Conservative. Both sides, as usual, try to find comfort in the result. The supporters of Mr. Chamberlain say the wonder is that they should have won a single election on an issue which two years ago would have been deemed outside of practical politics; the Free Traders contend that Cobdenism is proved to be still the popular belief.

Doubtless, the friends of the new policy are justified in pleading that it has been hampered by the somewhat dissimilar views of Mr. Balfour and Mr. Chamberlain, and that it has been impossible to get the best vote while the Premier stands for retaliation only and his fighting scout stands for protection. Besides, Mr. Chamberlain has practically assumed a dictatorship. He has appointed a committee of business experts to frame a tariff scheme, a proceeding surprising as well as provoking to upholders of the time honored device of a royal commission. Not only has he ruffled Tory and Liberal sensibilities alike by his hustling energy, but he has shown a vacillation of opinion which, tho partly attributable to the complexity of imperial interests involved, is also chargeable to his own haste. At first he hinted vaguely at a slight taxation of some raw materials, then quickly withdrew from that position. He declared, too, that the colonies would be willing to give a preference to secondary and more specialized British manufactures if the latter would leave colonial manufactures unthreatened in such interests as they had already built up; now he has also given up that contention and admits that the colonies demand a free hand in their own development. It is not to be wondered at that the ex-Colonial Secretary finds himself in a political ferment, due almost as much to the ill-defined and immature views of his own friends as to the vigor of his opponents.

The latter have been much strengthened by the accession to their ranks of the Duke of Devonshire, lately Mr. Chamberlain's colleague. He is not yet formally accredited as leader, but the inefficiency of Rosebery and the commonplace abilities of Campbell-Bannerman would have made the Liberal situation hopeless if the Duke of Devonshire had not stepped in to organize the opposition fragments into something like a fighting party. The Duke, tho stolid and consti-

tutionally indolent, is trusted by Englishmen because of his caution, moderation and disinterestedness, and he is the only statesman possible as a foil to Mr. Chamberlain in this crisis. It remains to be seen whether the Free Traders in both parties will sink minor differences in a common and prolonged effort to oppose the threatened return to protection.

Concurrently with the platform arguments for and against the new tariff scheme, there has been a no less notable discussion in the British magazines and reviews. Many of these have been extraordinarily able, W. H. Mallock, Sir Robert Giffen, Benjamin Kidd, Dr. Beattie Crozier, Viscount Goschen and many other eminent writers and publicists have expressed their views, and no impartial critic can deny the strength which Mr. Chamberlain's policy has derived from the utterances of men who rank high as thinkers. The results thus far are, therefore, sufficient to challenge the predictions of those who look upon the new policy as merely a misguided and premature attempt. It is deeply fixed as a practical and urgent issue, and, in conformity with the course of constitutional agitation in Great Britain, will be fought out to a finish. Australia, New Zealand and South Africa have followed the Canadian example in asking for a preference, and that fact alone raises a question and affords a motive which, however variously viewed, is elemental in the consolidation of the Empire. Of that question and motive Mr. Chamberlain may be expected to take the fullest advantage.

Mr. Folk's Work in St. Louis

Some members of the present Municipal Council of St. Louis do not appear to have been frightened by the attacks of Prosecuting Attorney Folk upon a score of their predecessors in office. A grand jury is now inquiring about new and recent instances of "boodling" in connection with franchises for projects suggested by the approaching Exposition. Kratz, one of the old members, who found the weight of an indictment so inconvenient that he betook himself to Mexico, forfeiting a bond of $20,000, was brought back in custody three weeks ago, but was speedily at liberty again, having remarked to Mr. Folk that he could be elected Governor of Missouri if he cared to remain in town and become a candidate. The go-between in the recent negotiations which have attracted the grand jury's attention is reported to have been a "boodler" already convicted and sentenced. The peculiar features of the situation direct attention to one aspect of these memorable prosecutions of which the public has little or no knowledge. Mr. Folk and his grand and petit juries have labored earnestly and continuously for a long time. Many persons, State legislators as well as municipal councilmen and the purchasers of legislation, have been indicted. About a score of these have been convicted and sentenced. Within the last month it has repeatedly been asserted in the press that not one of these convicts has yet been imprisoned. This seems incredible, but we have seen no denial of it. Conviction in these cases does not seem to imply punishment. On appeal the views of the Supreme Court have been at variance with those of the petit juries and trial judges. In one case, a convicted man escaped in this way: the evidence that he had bribed or attempted to bribe a municipal officer was not overcome, but it was held that the officer in question was not the one who was authorized to award the contract for which the bribe was offered. There had been some doubt about the distribution of authority, but the job really belonged to another department. And so this victim of Mr. Folk's energy gained his liberty because the bribe had been given or offered to the wrong man. If indictment, prosecution, conviction and sentence are not to be followed by punishment, there is nothing surprising in the complacency of Kratz or in fresh negotiations for the corrupt sale of franchises. As the matter stands now, a full record of the cases, including the action of the Supreme Court, would be an interesting and curious exhibit at the coming Exposition.

The Chautauqua Postal Frauds

Up to the present time, so far as we can learn, there has been no attempt to punish any of the persons accused in the Bristow report of those

offenses at the post offices in Fredonia and Dunkirk, N. Y., to which we referred last week. The postmasters who carried on their rolls for years persons who did no service, the men who thus wrongfully received thousands of dollars of public money, the others who procured the fraudulent appointments and may have profited by them—none of these has been disturbed, so far as we know, by any proceedings designed to inflict punishment for such violations of law. Supreme Court Justice Hooker has made no public reply to the charges which prominent men of his own party in Fredonia have made against him in connection with the disclosures of the Bristow report. Complaint was made because Governor Odell, after the publication of that report, designated Justice Hooker to sit in Brooklyn as a member of the Appellate Division, this transfer from the western end of the State increasing his salary from $7,200 to $17,500 a year. The Governor has since said that he should be glad to be relieved of the responsibility of making such appointments. Therefore it was proposed last week in the Legislature that by constitutional amendment the power to make such designations should be vested in the State's highest court. The statements of the Bristow report, corroborated as they are by local testimony, call for prompt judicial inquiry. Neither the Post Office Department nor the Department of Justice can afford to ignore them.

Whittaker Wright

Mr. Whittaker Wright was the most successful floater of bloated, dropsical financial corporations that Great Britain has known for many years. He had great success in persuading men of sounding title to become directors in his companies. Of course, the public had to be deceived, and great was the loss when the smash came. Then Wright was arrested and charged with fraud. Luckily there was certain evidence which the court could use to prove the fraud, and he was convicted, took poison and died before he left the building. He was a "good" man, and his townsmen deeply mourn one who was so kind and public-spirited, and his victims mourn him for another reason. We have lately seen proof that the stock of American companies has had similar injections of water with equally fraudulent intent. Only this last week one stock has been removed from the New York list because of such a fraud of half a million dollars; but we would like to see evidence that our courts will punish those who are guilty of such frauds with prison stripes as they do in England. A colossal thief deserves punishment even more than one who swipes a pocketbook.

A New Southern University

There is a plenty of struggling "colleges" in the South, but not near enough universities of a high character, and we therefore welcome the proposed establishment at Atlanta of a well endowed university under Southern Presbyterian control. The Southern Methodists have Vanderbilt University at Nashville, and the Episcopalians have theirs at Sewanee, and there are the non-sectarian University of Virginia at Charlottesville and Tulane at New Orleans. The plan is to unite the Columbia, S. C., Theological Seminary and the Southwestern University at Clarksville, Tenn., at Atlanta, and that city has already raised $250,000 as a sort of invitation. The combined productive funds that will come to it from the two institutions are over $500,000. Its friends speak of it as a "million-dollar university." A million dollars is hardly a beginning for a university, and we do not see that the million is yet secured. But with six State synods uniting in the scheme it may hope to enlist further gifts, and there is wealth in the South, and there are Northern Presbyterians who might be called in to endow the institution, as Vanderbilt and Tulane sent their gifts to the institutions that bear their names. Why should not this university be a tie to unite the too long dissevered halves of American Presbyterianism? President Harper says that "denominationalism in universities is narrow-mindedness," and he is wise in declaring that Chicago University is no longer a Baptist institution. Nevertheless, there is place for denominational universities of the second class. Harvard is no longer Unitarian, or Yale Congregational, nor Columbia Episcopalian, notwithstanding some unfortunate relics of their sectarian days.

Sunday Closing

The advice of the settlement workers in a great city like New York as to the social conditions is likely to be good; and, accordingly, we look with great respect on a report of a committee of the Association of Neighborhood Workers on the question of the Sunday closing of saloons. They have made a careful investigation of a number of neighborhoods, and they find that but a very small proportion of the saloons comply with the provisions of the law closing the saloons on Sunday. They do not dare to close, because it would send their patrons to other saloons on week days as well as Sundays. The result is that the community is taught that law has no sanctity, that the people generally may disobey it when they wish. Children are brought up to evade and despise law. Accordingly, as the law is not enforced, and apparently cannot be enforced, and the people are taught to disobey law, they would have the law changed. It is not that they want open saloons, but that they feel the terrible evil of bringing up youth to defy law. This is an argument that we cannot resist. It is better to have no law than to have a law that is wantonly and publicly and generally flouted. These settlement workers, therefore, conclude that in the interest of a wholesome spirit of law observance some form of Sunday opening of saloons should be allowed in New York, and we agree with them. An ideal law that utterly fails of observance ceases to be ideal. It is itself a lesson in crime. Let the law go until the public conscience can be educated to obey it. And it is not clear why Sunday drinking is so much worse than Monday drinking.

Joan of Arc

The Venerable Joan of Arc (that is her title now) has been beatified by the Pope, but not yet canonized. She can have a certain degree of religious honor, but not that of a full saint. It has been proved that two miracles have been done by her intercession, but now two new ones will be required to canonize her. Her case may give a warning, as it shows how the judgment of the clerics of one day may be reversed by their successors. M. Harduin asks in *Le Matin* what would be the feelings of the clergy of her day if they could return to this world and see her so far on the way to being a canonized saint. At that time the Archbishop of Rheims wrote:

> "The punishment of 'La Pucelle' was a sign of God's justice, who wished to punish a proud woman."

Poor Joan was burned at the stake, having had as judges a bishop, 9 abbots, 8 canons, 21 priests and monks, 23 doctors of divinity—in all 68 clerical out of 71 judges. Moreover, the University of Paris, made up almost exclusively of priests, declared her sentence legal. The Pope may be infallible, but nobody else.

Explorations in Palestine

The German *Orient-gesellschaft,* which is under the especial patronage of the Kaiser, has undertaken the work of excavating in Palestine, in addition to the work it is doing in Babylon and Egypt. It is co-operating with the German Society for the Exploration of Palestine, and under the direction of Dr. G. Schumacher excavations have been made for the last season at Tel el-Mutesellim, long thought to cover some important city of ancient times, probably the ancient city of Megiddo, a city famous in Palestine even before the entrance of the Jews under Joshua, and the site of the famous battle between the Egyptian army of Thothmes III and the confederate Kings of Palestine. Professor Sellin, of Vienna, had already pitched upon this tel for some private excavating work, and it was soon amicably agreed that he should take the Tel Ta'annek (the Taanach of Josh., 12:21) lying to the eastward, while the German Society should work to the south of the main tel. Operations under Dr. Schumacher began on April 1st, 1903, and work was continued for two months. The highest part of the tel was first attacked as probably concealing some acropolis, and here was actually discovered a tower whose steps led to the massive stone walls, eight feet thick, of an ancient acropolis. While all of the gateway has not been laid bare, it is plain that the work is Jewish. Remains of brick work and a water conduit are found here. Some 12 inches or so under the surface were found remains of a quadrangular building, about 20 feet

square, in which are two erect stone pillars, so-called *Matseboth*. They were about 12 feet apart and about 7 feet tall. To the right of one of the *Matseboth* was a third column, only 4 feet high. In a chamber near that containing the *Matseboth* were found three sacrificial urns, which were filled with sifted earth and the skeletons of some very young children. The head of the child was invariably at the bottom of the jar. It is suggested that these were sacrificed when the building was erected. An idol some 18 inches high was found here; it is evidently of Egyptian origin. Other Egyptian articles, such as porcelain eyes and amulets, were found here. Deeper excavations uncovered more of the walls, a building of unbaked bricks, several idols, and on two upright stone columns the Phœnician letters *Samek* and *Zayin*. In a part of the ruins were found several clay seals with the inscription LEG VI PR, showing that the Sixth Roman Legion must have been encamped here for some time. Remains of a Roman theater have also been found in the neighborhood, showing the permanence of the Roman occupation here. It is hoped that the next campaign, opened during the autumn, will furnish still more important finds, as the ruins of Megiddo must contain much of value to archeologists when the excavators have gone deep enough into the tel.

The trustees of the Peabody Fund met in Washington last week, but came to no conclusion as to their policy in the possible distribution of the Fund, nor as to the selection of a successor to Dr. Curry as General Agent. Dr. Curry was also General Agent for the Slater Fund, which is devoted to negro education; and as it would be economy for his successor to hold both trusts, it is important that a man of right views be chosen. Dr. Curry had great merits and did a noble work; his error was that he believed and taught in his reports that the negro must ever remain an inferior race devoted to manual labor, and that, therefore, no aid should be given except for industrial education. We do not ask that a trained Northern educator be appointed, but we do ask that if a Southern man is chosen he be one who believes in equal educational privileges for all people.

In explanation of the fact that radium salts are warmer than the surrounding objects and are, therefore, giving off energy continually, the theory has been proposed that this energy is due to the power of the radium compounds to absorb and transform into heat certain unknown forms of radiation, perhaps from the sun. If this is true, radium in a concentrated state would absorb less and thus have less radio-activity than the same amount covering a larger area. Professor Rutherford, of Montreal, has just tested this and has found that the activity of solid radium bromide is the same as when it is dissolved and occupies a thousand times its original volume. This indicates that the source of the energy radiated is internal and apparently due to a decomposition of the radium atom.

There seems to be injustice for somebody in the sale of 40,000 tons of steel rails by a Pennsylvania manufacturing company to a transcontinental railway in Canada at $21.50 per ton, when it is well known that any railway in the United States—even one running parallel to this Canadian road, and competing with it—must pay $28 for such rails to the same manufacturing company, or to any other that produces rails under the American flag. In this transaction the reduction of price makes a difference of $260,000. There is injustice, and the weight of it lies upon the American people, who have given the combined manufacturers a protective tariff duty that enables them to exact $28 from consumers at home, while they sell abroad at $21.50, and even less.

They have an Irish Mayor in Boston now. In 1851 it made a tremendous excitement in Boston when the first Irishman, Bernard McGilleskin, was made a policeman. Now they say that when an Englishman leaves his native land for foreign parts he remains an Englishman; a Scotsman abroad remains a Scotchman; an Irishman, wherever he goes, becomes a policeman.

Insurance

Automobile Liability Insurance

An automobile liability policy is now purchasable. The *Evening Post* describes it in part as follows:

"It affords protection to owners of autmobiles against liabilities for accidental personal injuries to employees or to the public caused by the automobiles owned by them, and which invariably result in litigation and frequent awarding of damages. The premium is based on the number of automobiles owned, to be insured: Electric (twelve horse-power), $40 each; gasoline (twelve horse-power), $60 each; steam (twelve horse-power), $100 each; for each horse-power in excess, $2.50. The usual limits of liability policies are, in the event of an accident causing the death or injury of one person, $5,000; in event of an accident causing the death or injury of several persons, $10,000.

"The policies do not lapse upon these limits being reached, but continue their warranty to pay within such limits every accident that may take place during the policy year, whether few or many. If already carrying above limits, second limits for the same amount may be had for: Electric (twelve horse-power), $20 each; gasoline (twelve horse-power), $30 each; steam (twelve horse-power), $50 each; $2.50 for each horse-power in excess of twelve, thus doubling the amount of the insurance.

"The policy provides that the assured shall report every accident to the company, and, where indemnity is or may be applied for the company, by competent inspectors, thoroughly investigates the circumstances relating to the case, and if the same indicates liability on the part of the assured, immediate steps are taken with a view to settlement without litigation. Should, however, legal proceedings be taken, the company undertakes the defense of the suit on the assured's behalf, and defrays costs and expenses up to the limit named."

The Passing of Queer Insurance

The collapse of the Louisville strike insurance idea that was intended to revolutionize things in the insurance world has been followed by the failure of the American Mother's Birth Insurance Company, of Boston, some account of the launching of which company was printed in The Independent on July 30th last. The moral of it all is that the present time is not favorable for freak insurance of any kind.

The Carnegie Insurance Fund

Announcement is made that Andrew Carnegie has set aside $4,000,000, the interest of which he intends shall form a permanent fund to relieve workmen who are injured in the various Carnegie mills. The heirs of those killed while at work will also be aided.

Injured workmen with families will receive out of this fund one dollar per day during enforced idleness. An allowance of 75 cents daily will be made to single men, and children under 16 will have a drawing account of 10 cents daily.

The family of an adult employee who is killed while at work will be entitled to $500, and $100 will be paid in a similar manner to the relatives of a minor employed by the Carnegie concerns who meets death in the discharge of his duties.

Certain safeguards, such as the certificates of regularly appointed physicians, will necessarily be a part of the system, and the presentation of such certificates will have to precede the payment of injury or death claims.

The Massachusetts Mutual Life Insurance Company, of Springfield, Mass., is issuing an interesting little booklet containing the company's fifty-second annual statement and other material. One of the features of this booklet lies in the tabulations of the States in which the various policyholders live. Of the 73,202 policyholders, the largest number, 11,979, live in New York. The smallest number, 8, reside in Delaware. Oklahoma Territory has 219 resident policyholders and comes next to Delaware.

Insurance Statements

THE METROPOLITAN LIFE INSURANCE COMPANY.

The recently published statement of the Metropolitan Life Insurance Company is an illustration of the remarkable growth and popularity of life insurance in the United States. This company was originally chartered as a casualty company, and began business as the National Travelers' Insurance Company. The act of incorporation was passed in New York State on May 5th, 1866. On March 24th, 1868, an act

was passed by means of which the name of the company was changed to the Metropolitan Life Insurance Company. The casualty feature of the business was presently dropped after the name was changed. The working methods of the system of insurance, known as the English industrial plan, were adopted by the company in 1879. The issue of the industrial policies was begun in November of the same year, and insurance closely approximating half a million dollars was written. Subsequently the system was rapidly and successfully developed, until the policies in force have now reached the extraordinary number of 7,520,915. The advance movement of the company, which began in 1892, has continued, under the presidency of John R. Hegeman, with but little interruption until the outstanding insurance now existing is $1,342,381,457. The total assets are more than one hundred and five million dollars, and the capital and surplus more than ten and one-half million dollars. Over seven and one-half million policies are now in force.

STATE MUTUAL LIFE ASSURANCE COMPANY, OF WORCESTER, MASS.

The business of the State Mutual Life Assurance Company for 1903 was satisfactory, according to their fifty-eighth annual report, which we publish in our advertising pages. During the year 5,928 policies were issued, which is 287 more than were issued during the exceedingly prosperous year preceding. The total amount of insurance signified by the policies of 1903 was also slightly in excess of the corresponding total for 1902. The total insurance in force on December 31st, 1903, was $100,902,399. The death rate has been somewhat in excess of the usual rate, but has been within the tabular or expected rate. During 1903 277 policy holders have died, insured under 385 policies. The longest term any policy was in force was 57 years and 1 month; the shortest was 9 days.

The net ledger assets of the company have increased during the year $1,692,982, and are now $21,713,027. The total assets on January 1st, 1904, including the market value of our securities over their cost, the uncollected and deferred premiums and accrued interest, in all is $23,249,248. A form of annuity policy has recently been added to the company's offerings. The securities held by the company are gilt edged. The President of the State Mutual Life Assurance Company is Col. A. George Bullock. The New York agents are C. W. Anderson & Son, of 220 Broadway.

THE MUTUAL LIFE INSURANCE COMPANY, OF NEW YORK.

The annual financial statement of the Mutual Life Insurance Company, of which Richard A. McCurdy is President, has just been issued. The company progresses in leaps and bounds, and the gains for the year just passed must as usual be written in millions. The total income of the company reached $77,333,712 in 1903, which was $4,028,690 in excess of the preceding year. The total assets of the company on December 31, 1903, were $401,821,661, as against $382,432,681 the year before, which was a gain of over $19,000,000.

During its existence of sixty-one years this company has paid back to its membership—from the funds accumulated for their benefit—more than $630,000,000, or nearly $200,000,000 more than the largest amount so returned by any similar organization. Charles H. Raymond & Co. are the Managers for the Metropolitan district.

THE GRANITE STATE FIRE INSURANCE COMPANY, OF PORTSMOUTH, N. H.

The annual statement of the Granite State Fire Insurance Company, of Portsmouth, N. H., of which Calvin Page is President and A. F. Howard is Secretary, contains the following interesting financial facts: Assets, $653,114.14; liabilities, including capital stock, $552,874.91; net surplus, $100,239.23; net depreciation of market value of investments, $47,291.22; decrease in uncollected premiums, $21,429.44. The funds of the company are invested in high grade securities, as shown by its statement published on another page. The business is confined to the New England States, New York, Pennsylvania and Michigan. The company is under careful and conservative management, as shown by the large home patronage it receives.

PHŒNIX MUTUAL LIFE INSURANCE COMPANY, OF HARTFORD, CONNECTICUT.

The fifty-third annual statement of the Phœnix Mutual Life Insurance Company, of Hartford, Conn., shows total assets of $17,011,161. This is an increase of $1,311,949 during the year. The number of policies now in force is 46,077, which is 3,365 more than was the case last year at the corresponding period. The total amount of insurance in force is now $76,663,067, or $5,798,475 more than last year. The President of the Phœnix Mutual Life Insurance Company is Jonathan B. Bunce, the Vice-President is John M. Holcombe and the Secretary is William A. More.

NEW HAMPSHIRE FIRE INSURANCE COMPANY, OF MANCHESTER, NEW HAMPSHIRE.

The thirty-fourth annual statement of the New Hampshire shows progress in the company's affairs. The assets of the company have grown to the extent of $98,277, and the total amount now is $3,877,846. The reinsurance reserve is shown to have increased $51,896 over last year's figures, and is now $1,421,416. The net surplus has grown to $1,193,546, which is a gain of $38,736. The growth of the company has been steady. Uberto C. Crosby continues as President of the company.

NORTHERN ASSURANCE COMPANY OF LONDON.

The twenty-seventh annual statement of the United States branch of the Northern Assurance Company, of London, shows a total of admitted assets in the United States of $3,400,487. The net surplus in the United States is the very satisfactory sum of $1,097,599. George W. Babb is the Manager of the company in this country. The local address is at 38 Pine Street.

Financial

The Year's Foreign Trade

Our foreign trade in the calendar year 1903 surpassed all previous records. Exports were $1,484,668,127, exceeding those of 1902 by nearly $124,000,000, although the values in the two years immediately preceding were almost as great. Imports rose to $995,473,101, against $969,000,000 in 1902, and $880,000,000 in 1901. The following table shows the growth of our foreign trade in the last decade:

	Exports.	Imports.	Total trade.
1903...	$1,484,668,127	$995,473,101	$2,480,141,228
1902...	1,360,685,933	969,316,870	2,330,002,803
1901...	1,465,375,860	880,419,910	2,345,795,770
1900...	1,477,946,113	829,149,714	2,307,095,827
1899...	1,275,467,971	798,967,410	2,074,435,381
1898...	1,255,546,266	634,964,448	1,890,510,714
1897...	1,099,709,045	742,595,229	1,842,304,274
1896...	1,005,837,941	681,579,556	1,687,416,797
1895...	824,860,136	801,669,347	1,626,529,483
1894...	825,102,248	676,312,941	1,501,415,189

The increase of imports was wholly in goods free of duty, the value of dutiable imports showing a decline of $2,500,000. Imports not dutiable are largely the raw material of manufacturers. December's record was an extraordinary one, the exports ($174,734,000) far exceeding those of any other month in the history of our foreign trade. The monthly average for the year was less than $124,000,000, and the largest value in any previous month was $163,000,000, in October, 1900. This remarkable increase in December was due chiefly to the shipments of cotton at high prices, the value of the cotton thus sold having been $72,000,000 for that month, and $140,000,000 for the two months of November and December.

Of the entire year's export increase of $124,000,000, the part credited to cotton is $88,000,000, exports of that staple having risen from $290,000,000 to $378,000,000 in value, although the increase in quantity was only 6 per cent. As for other agricultural exports, wheat (flour included) fell from $163,000,000 to $133,000,000, corn (meal included) rose from $12,000,000 to nearly $51,000,000, live animals advanced from $24,000,000 to $37,000,000, and provisions ($161,781,000) showed a slight decline. The large exports of the last three months cannot fail to exercise a favorable influence upon our financial operations of an international character.

Financial Items

The average dividend paid in 1903 by the Fall River cotton mills was 5.48 per cent., against 6.47 in 1902.

....It is announced in Montreal that the Canadian Pacific has bought 40,000 tons of rails from the Pennsylvania Steel Company at $21.50 per ton. The price in this country is still $28.

....Small quantities of International Mercantile Marine bonds were recently sold at $85. Quotations for stock have been $5 for common and about $18 for preferred.

....Edwin Hawley, of the banking house of Hawley & Davis, is the new President of the Merchants' Trust Company. The Vice-Presidents are Frank C. Travers and Jacob L. Phillips. F. P. Davis is Secretary-Treasurer. The capital and surplus is $1,500,000.

....Negotiations are in progress for a combination of the Tennessee Coal and Iron Company, the Sloss-Sheffield Steel and Iron Company and the Republic Iron and Steel Company, three large and prominent independent corporations in the iron and steel industry.

....The official figures for the output of pig iron in this country and in Germany in 1903 were published last week, as follows: United States, 18,009,252 tons; Germany, 10,085,634 tons. The increase over the output of 1902 was 187,945 tons here and 1,682,974 in Germany.

....The New York Stock Exchange has stricken from its list the common and preferred stock of the American Steel Foundries Company, of which Joseph E. Schwab, a brother of Charles M. Schwab, is President, owing to "misrepresentations of an important character" concerning its financial condition when application for listing was made. The company is a combination of six corporations.

The Independent

Vol. LVI NEW YORK, THURSDAY, FEBRUARY 11, 1904 No. 2880

Survey of the World

The Field of Politics

Mr. Elihu Root retired from the Cabinet on the 1st inst., and on the same day he returned to New York. On the 3d he was the guest of honor at a dinner given by 250 of his fellow-members of the Union League Club, and in the course of an eloquent address at that dinner he defended Mr. Roosevelt against the criticism of persons who had said that he was not "safe," commending him as "the greatest conservative force in Washington for the protection of property and our institutions." Before he reached this part of his address he had spoken of the Philippines, where—and it could have been done "only by the exercise of sovereignty"—the people had been "rescued from tyranny" and were beginning to learn what liberty means. "I look for the time," said he, "when the Philippines shall assume substantially the same relation to us as Cuba now holds." Referring to the Canal treaty, he predicted that, "guarding the neutrality of the Isthmus," we should give "to the peoples of South America the freedom they have not known," teaching them liberty and how it ought to be used. It had been, he said, one of the greatest privileges of his life to stand by and hold up the hands of Theodore Roosevelt:

"I am told that he is not popular in New York, that he who was born and who grew up to manhood among us, a member of this club, and who made his first essay into public life by going to represent us in the Legislature at Albany more than twenty years ago, is not popular here in the city of his home. I am told that people say he is not safe! I could not come back to you, between whom and me there have been no secrets and no concealments all these thirty-five years and more, and not say to you what I have felt and what I now feel on this subject.

"Men say he is not safe! He is not safe for the men who wish to prosecute selfish schemes for the public's detriment. He is not safe for the men who wish the Government conducted with greater reference to campaign contributions than to the public good. He is not safe for the men who wish to drag the President of the United States into a corner and make whispered arrangements which they dare not have known by their constituents.

"But I say to you that he has been, during these years, since President McKinley's death, the greatest conservative force in Washington for the protection of property and our institutions. There is a better way to protect property, to protect capital, and to protect great enterprises than by the buying of legislators. There is a better way to deal with labor and keep it from rising into the tumult of unregulated and resistless mobs than by starving it or by buying or corrupting its leaders. There are some things to be thought of besides the speculations of the hour.

"I have said that President Roosevelt is the greatest conservative force for the protection of property and capital in the city of Washington. I could give you specific instances where he stood in the way of men in Congress who greatly desired to pass extreme and violent measures, by the strong and unwavering declaration: 'I will veto your bill if you pass it!' He is great because he is so just and fair.

"I would rather have my boys taught to admire as the finest thing in our life the honesty and frankness, the truth and loyalty, the honor and devotion of Theodore Roosevelt, than to have them have all the wealth of this great metropolis."

The next speaker was ex-Attorney-General Griggs, who predicted that the time would come when Mr. Root, having been "faithful in a few things," would be "made ruler over all."—Mr. Bryan remarks in his newspaper that his recent speech at Lincoln has "had the desired effect":

"It has unmasked the reorganizers and shown that their pleas for harmony were mere pretense. Professing a great desire for reconciliation between those who voted the Democratic ticket and those who opposed the party, they had a concealed condition—namely, that the bolters should be permitted to write the platform, nominate the candidate and control the organization. It is well that their real purpose should be made known so early."

—Mr. Gorman suffers a loss of prestige by the election of Isidor Rayner to be his colleague in the Senate. After a long and exciting contest Mr. Rayner defeated Mr. Gorman's candidate in the caucus. The new Senator, who will succeed Mr. McComas, is a prominent lawyer, has been Attorney-General of Maryland, and was a member of the House at Washington for three terms. He defended Admiral Schley before the Court of Inquiry. —Judge Parker was one of the guests at a dinner of the Manhattan Club in New York, on the 6th, and was loudly cheered as "the next President." In his brief speech he made no reference to politics. In the course of a long address ex-Secretary Carlisle said that in his opinion the Democratic party had turned its face away from dead issues and was taking up live ones. No man, he added, "however influential he had been in the past," could arrest the progress of this movement, or could seriously obstruct it "by throwing himself or dead issues across its path."—Several speeches apparently designed for use in the coming campaign were made last week in the Senate, where the tariff, the events of Mr. Cleveland's second term, and the causes of prosperity and hard times were discussed by Messrs. Lodge, Foraker, Spooner, Gorman, Patterson and others. Mr. Gorman deprecated the building of a large navy for display. It was rumored in high naval circles, he said, that the United States was going around the globe with a chip on its shoulder, daring Germany to knock it off. Mr. Patterson commended the President for his suits against the railroad merger and Beef Trust, but complained that he had ignored the criminal clause of the Trust laws, which Senator Foraker "was trying to repeal."—The House Committee's Naval Appropriation bill calls for about $95,000,000, increases the number of enlisted men by 3,000, and provides for new ships, as follows: One battle ship, two armored cruisers, three scout cruisers, two colliers and two submarine boats.—On the 5th it was announced by the physicians attending him that Senator Hanna, who had been ill for several days, was suffering from typhoid fever. The place of infection is believed to have been Columbus, where there have recently been a thousand cases of this disease. —Mr. William C. Whitney, Secretary of the Navy in Mr. Cleveland's first Cabinet, died on the 2d at his home in New York, two days after he had submitted to a surgical operation for appendicitis.

Mr. Foraker's Trust Bill

Senator Foraker's bill for important modifications of the Anti-Trust and Interstate Commerce laws has been the subject of much discussion at Washington and elsewhere. By some of his Republican associates he is criticised for thus raising the Trust issue almost at the beginning of the Presidential campaign. He denies that he consulted either Mr. Roosevelt or Attorney-General Knox before he introduced the bill, and it is said that the President was very much annoyed by his action. In the politics of Ohio Mr. Foraker is not in agreement with his colleague, Mr. Hanna. It has been asserted in many dispatches from Washington that Mr. Foraker urged the President to make certain appointments in Ohio for places as to which he and his colleague were not in harmony, and that the President declined to take any action that might seem to be interference with factional or personal differences in that State. Mr. Knox has given to the press a long statement of his objections to the bill, prefacing it by the assertion that the Administration had no knowledge of Mr. Foraker's purpose. The bill, Mr. Knox says, would repeal the anti-pooling clause of the Interstate Commerce law. Pools, he remarks, were held to be unlawful at common law, but the common law rule could not be applied to interstate commerce except by act of Congress. After long discussion and agitation Congress enacted the present law. The bill would also repeal the provisions of both the Anti-Trust law and the Interstate Commerce law concerning the export and import trade, thus largely nullifying tariff

protection and giving foreign commerce an advantage over domestic. It would prevent any prohibition of the transportation of foreign goods from Berlin to Chicago at rates lower by 60 per cent. than the rates from New York or even Pittsburg to Chicago. Shipments were once made at such rates. It would be unwise, he adds, to apply the rule of reasonableness to the contracts of quasipublic corporations in restraint of trade, altho it might be wise to apply it in the case of private industrial corporations. This part of the bill would relieve the railroad corporations of most important duties to the public, and would undo very much of the most important remedial legislation of the past fifteen years.—Mr. Hearst, a Democratic candidate for the Presidential nomination, has attacked the bill in his newspapers, and has introduced in the House bills restoring the penalty of imprisonment (repealed by the Elkins act), and empowering District Attorneys of their own motion to prosecute violators of the Anti-Trust and Interstate Commerce laws.

The Panama Canal Treaty

Opposition to the new Canal Treaty is dying out in the Senate. It is now said that 21, and possibly 24, of the 33 Democrats will vote for ratification, and that final action will be taken within two weeks. There will be but little delay, if the Republicans accept a resolution which the Democrats intend to offer, suggesting that the President shall in some way reach an amicable agreement with Colombia. This resolution is not to express any criticism of his action. It is understood that negotiations for an agreement with Colombia are now in progress. Some say that our Government's proposition relates only to the payment of a part of the canal money by Panama to Colombia ($2,000,000 or $3,000,000), and others assert that the payment of a much larger sum to Colombia through the agency of Panama is under consideration. Republican Senators feel, it is said, that several millions could profitably be expended in providing for peace between Panama and Colombia, and in commending the United States to other South American republics. It is not expected that Senators Carmack, Morgan, Blackburn, Daniel, Bailey, Teller or Patterson will vote for the treaty under any conditions. Senator Clarke, of Arkansas (Democrat), spoke at length last week in support and approval of every step taken by the President. Senator Fairbanks defended the President's course in a long address.—In response to the Gorman resolution, the President has sent to the Senate a great mass of papers relating to the action of our Government on the Isthmus since 1855. Marines have been landed there on ten occasions, but only once without an actual request from the Isthmian authorities. They have never been employed there, the State Department says, except for the protection of American property and the preservation of the freedom of transit, under the treaty of 1846. The President withholds nothing except such orders as relate to the inner workings of the War and Navy Departments. The disclosure of these would be, in his judgment, "incompatible with the public interest." They do not relate, he says, to the general propositions now under discussion.—Perceiving that ratification is near at hand, Secretary Shaw has given notice to the national banks that hold special deposits of public money that the Government will be required in the near future to pay out $50,000,000 on account of the canal ($40,000,000 to the Canal Company and $10,000,000 to Panama), and that they should at once prepare to give up 20 per cent. of their deposits, or about $30,000,000. Discussion as to the effect of the payments upon the money market has disclosed the belief of financiers in Paris that about one-half of the Canal Company's stock is now owned in this country or controlled by American interests.—Some of the original stockholders of the first Canal Company have addressed to the French Minister of Justice a petition for an injunction to restrain M. Gautron, the liquidator of that company (who exercises a controlling influence with respect to the sale of the new company's property), alleging that he is incompetent by reason of senile debility, and asking that some one be appointed in his place. These petitioners oppose the sale.—It was reported last week that an engagement had taken place between Colombian troops and the Indians who live near the southern boundary of the Panama Republic.

—Dispatches from Colombia say that General Reyes was elected President on the 2d inst.

Great Fire in Baltimore

Enormous loss of property was caused in Baltimore on Sunday and Monday last by a conflagration that for a long time defied all efforts to restrain it. At 10.50 a. m. on Sunday an automatic alarm was given from the warehouse of Hurst & Co., a firm prominent in the wholesale dry goods trade, at Hopkins Place and German Street, in the heart of the business district. Fireman promptly responded, but could not check the progress of the flames. A gasoline tank in the Hurst Building had exploded, and the wind was high. In a short time a dozen warehouses were burning, and before the following morning the buildings in a district three-quarters of a mile long and four blocks wide had been destroyed. Among these were many fine and lofty structures erected by Trust companies and similar institutions, the costly new Court House, the Baltimore & Ohio Railroad office and two or three banks. All of the newspapers lost their buildings; two of them transferred their forces to Washington and were published there. Appeals for help were addressed to other cities. Engines and firemen were sent from Washington and Philadelphia, Sunday evening. Before Monday morning, ten engines, with sixty horses and a hundred firemen, were on their way from New York. At one time 400 streams were pouring upon the fire, but with little effect. A few large buildings and many small ones were wrecked by dynamite, in the hope that the fire could thus be checked. On Monday the most trustworthy estimate of the property losses was $75,000,000. At last reports there had been no loss of life, but about one hundred persons were suffering from injuries.

Cuba and Porto Rico

There are now no American troops in Cuba. On the 4th inst. the four companies of artillery that have been stationed on the island, two at Havana and two at Santiago, boarded a transport at Havana and sailed for home. The final ceremonies were of a simple character. On the plain near Cabana Fortress the American soldiers stood in line, with companies of Cuban Artillery and Rural Guards on the right and the left. The troops presented arms, the American flag was lowered from the camp flagstaff, the Cuban flag was hoisted in place of it, and at the Fortress a salute of 21 guns was fired. President Palma, addressing Minister Squiers in English, characterized the departure of these troops as one of the most extraordinary events in history. They were the last of the forces that had helped Cuba to gain independence and the blessings of freedom. They could have remained, under some pretext, and could have imposed unjust demands. But the United States proved its disinterestedness and sincerity by taking them away, thus showing that Cuba had the confidence of one of the most powerful nations of the earth. It was an act that reflected everlasting glory upon the American people.—The reported desire of our Senate so to amend the Platt Amendment Treaty that it shall surely be binding upon Cuba for all time causes some surprise in Havana, where it is pointed out that the agreement (recently ratified by Cuba) is practically a perpetual one, its terms forbidding amendment without the consent of both parties. It would be difficult, Cubans say, to secure ratification of the suggested amendments, because the treaty as it stands is regarded as burdensome, and one of the political parties calls for a modification of it.—Apologies have been given to the American Consul at Cienfuegos for the insulting treatment of his office during the recent election riots. The Government will make an investigation.—At Washington, the House has adopted by unanimous vote a resolution giving to Commissioner Degetau, of Porto Rico, the privileges of the floor, the right to address the House, and the right to be a member of the Committee on Insular Affairs. Immediately thereafter, he introduced a bill providing for a declaration that citizens of Porto Rico are citizens of the United States. Six hundred teachers are to be brought from Porto Rico to the States next summer on navy transports.

The Philippine Islands

In its annual report, the Philippine Commission recommends that the Sultan of Jolo be notified that the Bates treaty is no longer binding upon the United States, he having violated it repeatedly and forfeited his rights under it. The Commission asks that our tariff on sugar and tobacco from the islands be reduced to not more than 25 per cent. of the Dingley rates; that the coastwise navigation laws be not applied, until 1909, to trade between the islands and the States; that control over the shipping in the trade between the islands be left wholly to the discretion of the Commission, subject to the approval of the President and the Secretary of War; and that the Commission be authorized to encourage the investment of capital in railroads by accompanying the grants of franchises with a guaranty of income, not exceeding 4 per cent. Governor Taft, reporting to the Commission, says the number of friars in the islands was 246 on December 1st, against 1,013 in 1898. Concerning the Catholic Church, he says:

"Whatever may happen during the first few months of the coming of the American Bishops, it is certain that the spirit of the American Catholic Church is so different from that of the Spanish Church from a political standpoint that the influence of the Spanish friars will gradually wane, and that of the American Bishops become controlling, bringing about that which we so much desire, the Americanizing of the Roman Catholic Church in the Philippines."

Governor Wright was inaugurated at Manila on the 1st. He said that it was his purpose to support the principles of Governor Taft's administration.—Sixto Lopez recently arrived in Manila. Having refused to take the oath of allegiance, he will be deported.

Anarchy in Santo Domingo

The "chronic deviltry" that has been going on in Santo Domingo for the past few months has now brought the Republic to the last stage of anarchy. General Morales still holds the capital city of Santo Domingo, and seems to be slightly strengthening his position. General Jimenes holds the country districts, while ex-President Wos y Gil is biding his time at the sea coast waiting for a chance to recuperate and regain his lost position. There is little or no money to be had in the whole Republic, the national credit is *nil*, and life and property are absolutely insecure. Not only is the present situation worse than it has been at any time for years, but it is probably safe to say that the whole Republic is slowly reverting to barbarism. All competent travelers unite in declaring that Santo Domingo is the darkest spot in the new hemisphere. And all the while the fertile island, which once enjoyed a considerable prosperity and civilization, is reverting to a state of nature. The roads are becoming footpaths, the bridges are falling down, the markets are deserted and the jungle is gradually recovering the cleared land and the plantations. Last week, to cap the climax, the insurgents deliberately fired at a launch of the United States cruiser "Yankee" as it approached the city wharf and killed J. G. Johnson, a machinist. As a consequence, Minister Powell has told the American naval officer in command to take drastic measures to protect the American honor and interests. Our State Department has also ordered extra war ships to the theater of action. In the meantime, the European nations, especially Germany and England, are becoming restive, and it is predicted that if our patience is not soon exhausted they will take a hand themselves and punish the negro republic. Many people, both in Santo Domingo and the United States, urge the annexation of the black republic to this country as the only solution of the Republic's troubles. Be this as it may, it is alleged that owing to the dire warnings of certain Porto Rican exiles, the Dominicans are turning away from the United States and looking to Germany for their protection. Whether this is true or not, it is almost certain that a crisis confronts the United States in its relation to Santo Domingo. Another week may see some interesting developments.

English Politics

In the replies to the Address from the Throne at the opening of Parliament, attacks were made on the Government by the Liberals

for negligence in preparations and the mismanagement of the Boer War, and by the Nationalists for the disregard of Irish interests. The Liberal leader, Sir Henry Campbell-Bannerman, stated that June 20th, 1899, Mr. Chamberlain asked him for the support of the Opposition in sending 10,000 troops to South Africa, saying, "We know those fellows won't fight. We are playing a game of bluff." Mr. Chamberlain in reply said he did not think he used the word "bluff," but he would call attention to the admission just made that the Liberal Opposition was to blame for the deficiency in the British forces in South Africa at the outbreak of the war and the consequent early reverses. Peace was impossible because Mr. Krüger had relied on foreign intervention and had been led by the conduct of the Opposition to believe that Great Britain was not in earnest.—John Redmond declared that the concessions made to the Irish in the recent Land Act had not shelved the Irish question, but that, on the contrary, every concession they had obtained or might obtain would be used for the furtherance of the contest for Home Rule. The Irish would rather govern themselves badly than be governed well by another nation. Since the Government had refused to carry out its promises to establish a Catholic University in Ireland, it was the duty of the Irish members henceforth to oppose the Government. This revival of Home Rule agitation plays directly into Mr. Chamberlain's hands, even tho it may hasten the fall of the Balfour Cabinet, because he has been striving to maintain the organization of the Liberal-Unionist party, against the Duke of Devonshire, the former leader of the party, who wishes to disband it on the ground that the Home Rule issue, which was the cause of its organization, is now of no practical importance.—The Executive Council of the Liberal-Unionist party has decided to continue the organization, and will assist all candidates who will agree to support Premier Balfour, whatever may be their views on the proposed tariff policy.—The Chamberlain Tariff Commission is now holding secret sessions twice a week. It is composed of 68 members representing all the important branches of commerce and manufacture, and the object, as stated by Mr. Chamberlain, is to ascertain by what method a reform of trade conditions may be accomplished with the slightest possible disturbance of business. In placing such a question in the hands of business men instead of politicians and in including representatives of the colonies Mr. Chamberlain has made a wide departure from the ordinary British policy. The Commission has no official status, and its powers are purely advisory.

Germany An association for the promotion of a commercial union between central European states to resist the American invasion in the industrial world has been formed in Berlin under the presidency of Duke Ernst Günther, of Schleswig-Holstein, the brother-in-law of Emperor William. The first meeting was attended by a hundred and fifty prominent economists, manufacturers, merchants and politicians, and Germany, Austria-Hungary, Italy, France, Switzerland, the Netherlands and Scandinavia are the countries included in the proposed alliance. It is expected that the association will make the people of Europe realize that their common industrial interests are threatened by the extension of American foreign commerce, and that nothing but the adoption of a uniform and stringent tariff will prevent the destruction of European industries. In default of governmental action it is proposed to organize the more important industries into great international trusts, which would thus co-operate against a common enemy. —The Agrarians have sharply attacked the Government for its failure to protect agricultural interests by denouncing the present commercial treaties and substituting higher duties on grain and meat. German agriculture is in an intolerable condition, and an increase of the duty on wheat is said to be necessary in order to prevent Germany from being totally dependent on foreign countries for its food supplies, as England now is.—A curious scheme for a combination workingmen's saving bank and lottery is under consideration in Prussia and said to be favored by the Government. Small weekly deposits, of from 10 cents to a dollar, are to be received by the banks, and instead of interest the depositors are

to receive lottery tickets in proportion to the amount of their deposits. The income, after allowing for administrative expenses, is to be awarded by lottery, in which there are 12,500 prizes, ranging in value from $25,000 to $5. A weekly journal will be sent free to all depositors, and the income from its advertising will be added to the lottery fund. The newspaper, under Government management, would have, it is estimated, 2,400,000 readers and would be an important factor in molding public opinion.

Italy

On February 1st an Anglo-Italian arbitration treaty was signed at Rome by the Foreign Minister, Signor Tittoni, and the British Ambassador, Sir F. L. Bertier. Last year a similar treaty was signed between France and Italy, and also one between France and England, so these three countries are bound together for the preservation of peace. The three treaties are almost identical in terms, brief, and do not cover all cases of possible conflict, but they will certainly tend to prevent a rupture of diplomatic relations through minor disagreements. The present Italian Government holds that the fact that Italy is bound by the Triple Alliance to Germany and Austria-Hungary does not prevent her from forming a closer connection with France and England, and this policy, taking into consideration also the open disregard shown by the present French Government for the old feud with Germany, gives great confidence in the security of European peace.—The Socialists in the Italian Parliament have succeeded in getting a bill introduced providing for a commission to examine into the condition of the navy. The commission will be composed of six Senators, six Deputies and three naval officials, and will report within a year.

Impending Trouble in the Balkans

It is quite probable that a war in Eastern Asia will give occasion for an outbreak in Eastern Europe among the turbulent peoples who have only been kept from open warfare by the vigilant repression of the Powers. As the tension between Russia and Japan has increased, Bulgaria and Turkey have become more openly hostile, and now apparently are only seeking for a pretext to attack each other. Such a pretext seemed to have presented itself in the interference of Turkish officials with Bulgarian commerce, and in particular the detention at Constantinople of the baggage of M. Mateef, the Bulgarian Commissioner to the St. Louis Exposition, but the Porte promptly disavowed the acts of the custom officers. The Sultan declares himself ready to carry out the administrative reforms in Macedonia insisted upon by Russia and Austria-Hungary, but only when Bulgaria shall change its threatening attitude and the revolutionists become quiet. This means an indefinite postponement of the reforms, for the Bulgarian Sobranje before adjourning voted a large emergency credit to the War Department, and Boris Sarafoff, the leader of the Revolutionists, is expected in the Monastir country soon, where riots have already occurred. Turkish troops are assembled on the frontier, and it is reported from Salonika that the Government has ordered the railway company to place all their rolling stock at the disposal of the military authorities, and to keep coal depots at every station.

Japan and Russia

Without waiting for the long delayed reply of Russia, Japan on Saturday ordered Mr. Kurino, the Japanese Minister at St. Petersburg, to sever the diplomatic relations between the two countries by withdrawing, and he will leave at once for Berlin. Baron de Rosen, the Russian Minister at Tokyo, who has personally done all he could to preserve peace, will leave Japan as soon as possible. Apparently, Japan has been only waiting for the arrival of her new cruisers from the Mediterranean, which have now reached Chinese waters. The Russian note was already on its way and it was known that it was not in accordance with the Japanese proposals, altho its exact contents have not been made public. It is understood that Russia insists on the independence of Korea and will prevent any fortifications in the southern part of the peninsula, which would threaten the

Russian communications between Vladivostok and Port Arthur, and that Japan insisted on a treaty which would prevent the annexation of Manchuria by Russia, and would insure equal commercial rights there to all nations. Large bodies of Russian troops are stationed along the Yalu River, probably on the Korean side as well as the Manchurian, while the Fusan-Seoul Railway is already practically in the hands of the Japanese soldiers, and transports at Tsushima, only forty miles from Masanpho, will easily convey into Korea the troops in readiness there. The Russian fleet last Thursday passed out through the narrow channel at the mouth of the harbor of Port Arthur, and after maneuvering off Wei-hai-wei came to anchor just outside. It is reported as we go to press that Japanese warships are on their way to Chemulpo, the port of Seoul, and that they have captured on their way several Russian trading vessels.

The Chinese Question in the Transvaal

The Legislative Council passed, by a vote of 22 to 4, Sir George Farrar's motion requesting the Government to prepare an ordinance for the importation of Chinese laborers into the colony, and the bill has passed its third reading. The members of the Legislative Council are not elected, but appointed, twelve of them being official, so there is some question whether this action represents the wishes of the people as a whole. To remove this objection numerous mass meetings have been held, which have, in most cases, declared in favor of Chinese labor, and a monster petition to the same effect, said to contain 45,100 names, or 70 per cent. of the white residents of the Transvaal, excluding Government employees, has been prepared to present to the Council. The Boers are divided on the question, and some of the labor leaders favor the importation of Asiatics, on the ground that it will give employment to skilled workmen now idle on account of the general stagnation. It is claimed by the advocates of the proposed policy that it is impracticable to use white unskilled labor in the mines, and it is impossible to get natives from Central Africa and Uganda, while Asiatic labor can be imported under contract in restricted numbers, under such provisions that they shall be returned to their own country at the expiration of their time. The minority in the Council argued that natives could be procured if they were treated decently; that the number of laborers needed is exaggerated by the mine owners, and by the use of more machinery and payment of better wages with proper economy in administration the mines can be worked by white labor. Under the provisions of the proposed law imported laborers can be employed only in unskilled labor in the mines of the Witwatersrand district, and no laborer can remain longer than five years. The Premiers of the Australian Commonwealth and New Zealand have sent protests to the Imperial Government against the introduction of Chinese labor; this action is considered by many as an unwarrantable interference in the internal affairs of a colony by others.

German Southwest Africa

The relief expedition from Swakopmund has succeeded in relieving the garrisons at Okahandja and Windhoek after a fierce engagement against natives of ten times the number of the Germans. The fight lasted six hours, and at the end this main camp of the enemy on Kaiser Wilhelm Mountain was stormed and the stolen cattle recovered. The railroad is now in operation from the coast to Windhoek. Omaruru, north of the railroad, which fifty men have held since the outbreak, has been reached by a small party after hard fighting, but is still surrounded by the natives, and a force of 400 Germans, soldiers and marines from the gunboat "Habicht," with artillery, have gone to its aid. Ninety-one soldiers and settlers, including women and children, are known to have been killed in the colony, and more than two hundred are yet unaccounted for. Colonel Luetwein, Governor of German Southwest Africa, who has been in the southern part subduing the Bondelzwartz Hottentots, has now returned, but it is reported that these tribes are again in revolt, and the settlers there are in danger.

The Real Enemies of Good Government

BY GUSTAVUS MYERS

Author of "The History of Tammany Hall," Etc.

IN the aftermath of comments upon the recent triumph of Tammany Hall one view in particular has been advanced with such conspicuous pertinacity that it merits the most serious consideration. It is a view significant of the attitude of a number of influential writers, both here and abroad; and apart from its repetition in print, it is heard constantly in the domain of private conversation. Each recurring defeat of the forces of civic decency appears to give it a firmer and a wider basis and a validity of fact not to be easily disputed. Applied in this instance to New York City, it is a view which is commonly expressed whenever, in any great American city, the majority sanctions the continuance of plundering government or deposes an honest administration to make way for spoliation.

To many commentators the recent success of Tammany Hall bore a distinct interpretation. This was that the masses are incapable of sustained effort for good government.

In every community there is an exclusive "better class," which seems to itself to have virtues and an order of intellect wanting in the common run of mankind. It has its habitual sneers at a something huge and vulgar which assumes tangible shape in its mind as the masses. Were the view to which I refer confined to this class it might well be regarded with little apprehension. But it emanates from many thinkers who strive to be impartial, and who have no intention of stooping to abuse or patronization, whatever tone their comments may superficially suggest. Nor does it represent the judgment of the hour, springing from the bitterness of defeat. Time and time again it is iterated with deliberation, and such unprejudiced, mature scholars as Mr. Lecky and Mr. Godkin, have, in different ways, combined it in their works.

It is a view which is fundamentally wrong, both by what it says and by what it implies, and in its ulterior application it transcends the mere bounds of municipalities and strikes at the endurance of manhood suffrage itself. In its present incipient form it seems divested of serious importance. It involves, however, a question of the gravest character —whether or not democracy is a failure. And, in a country where social and industrial conditions are gravitating to a pitch of great intensity; where concentrated corporate wealth juxtaposes a vast proletariat population; where, as Mr. Jack London so ably pointed out in The Independent, class lines are rapidly forming—the determining of this question is one that will ultimately affect the whole fabric of our Government.

For, *ipso facto,* the growing view that the masses are to be distrusted, if not feared, conveys its clear implication. This is that there is a class to whom the decision of public affairs can safely be intrusted. And what is this class? Here we are forced to go back to that Federalist doctrine which dominated established conditions until the third, fourth and fifth decades of the nineteenth century—the doctrine of property qualification. It is the old idea, inherited from the British aristocracy, that the electoral power should be lodged in the propertied classes, who, it was held, really represented the intelligence, the virtue, the stability and the wealth of the country. No public man has yet dared to urge a restriction of the franchise. No newspaper, however owned or subsidized, has been so rash as openly to deny manhood suffrage. But if the thought has not been expressed outright, it seems latent in many of the published comments. Where freedom of

print is self-abridged by politic considerations, that of private speech allows itself a wide latitude. And in the privacy of conversation one often hears a deploring that great questions affecting business interests must be submitted to the caprices of an irresponsible mass of voters. This is the general sentiment in commercial quarters; and, as commerce has the supreme mastery of the land and in centripetal power is destined to grow mightier still, it may—doubtless, will—not always be content with trammels it must now endure. As it has overridden and circumvented laws aimed at its concentrated growth, so in time it will doubtless strive to fashion political conditions to suit its own ends. The cry that democracy is a failure—that the masses of voters are incapable of self-government—will be a very potent weapon in its hands. But the signs portend the growth of a new political party, which, scarcely noticed, has already entered upon its formative stages. I refer, of course, to revolutionary socialism. This is the threatened opposition the great corporate power will have to face; and as the new party will be composed of the masses of voters and will seek to turn over to governmental control the very utilities upon which the corporate classes have acquired their power, it will be to the corporate elements the most radical peril that they have yet encountered. It will be a peril whose strength will spring from manhood suffrage. As the danger draws near, the great corporations, driven to defensive organization, will attempt to ward it off by those indirect methods which attain their ends without seeming to encroach upon the liberties of the people. They will not use too overt means calculated to awaken popular suspicion; but I am inclined to think that, seizing hold of the view that the masses of voters are irresponsible, they will use that as a lever and will try to get through, step by step, processes of legislation which will tend in some form to minimize the political action of the many.

This may seem to be an alarmist prediction; and there are those in plenty who will deride the idea that the masses of voters will ever allow themselves to be dispossessed of rights in which they are now so strongly intrenched. But, apart from the well-known dictum that privilege always edges its way by imperceptible degrees, and in the very act of subverting free institutions shows the most scrupulous regard for popular forms, we have in our own generation witnessed an extraordinary transformation. We have seen the principle, once thought so inviolable and impregnable, and even now sworn to by a forlorn remnant, that "competition is the life of trade," being overthrown. No series of carefully drafted laws and no outbursts of public sentiment have sufficed to keep it from being trampled under. Under the very eyes of the people an industrial aristocracy has been established, which, in audacity of aims and potency of resources, far surpasses the expectations of the few who thirty and forty years ago predicted its rise. And as industrial freedom is being all the time more effectively suppressed, so it is fair to predict by analogy that political freedom will be subjected to similar attacks. These two spheres of action, apparently having no relevancy, do, in fact, concatenate each other. Political freedom, if persisted in, will inevitably efface industrial despotism and supplant it with something better. The two are essentially antagonistic and can no more last co-ordinately than, in the phrase of Lincoln, a country can exist, half slave and half free. The men who have the consummate ability to plan and combine gigantic enterprises and apportion among themselves the revenues of peoples do not lack the perspicacity to foresee. Nor do they fail to understand the value of the oft-proven principle that no despotism is so securely established as that which seems to spring from the voluntary suffrages of the people. More and more in the United States these men are becoming the real instigators or abettors of that authoritative opinion which makes and unmakes laws and uproots conditions. Sometimes they inspire the powerful agencies of print and oratory that mold public opinion; at other times they divert a view that permeates a part of the community to their own ends. To imply that there is, at the present time, an organization to subvert political freedom would be wild. But, beyond doubt,

there is a certain effective cohesiveness, a collective energy of united action, on the part of the great corporate interests whenever any critical agitation threatens their vital interests. They have the advantage of fewness of number, of knowing what they want and of the power to attain their purposes with celerity, while the many are divided by conflicting opinions and sway this way and that in awkward preponderance.

The effect of the view that the masses of voters are irresponsible is already visible. The general tendency—viewing the country as a whole—to lengthen, whenever constitutionally possible, the tenure of public officials and to concentrate in them a greater measure of power and responsibility is one of the evidences. The tendency to increase the appointive power of executives is a second evidence. There seems to be a distinct reversion to that Federalist principle—a principle which still survives in its original form in our Electoral College—of giving indirect instead of direct power to the electorate. Where the law-making functions of the Government, National and State, rest upon the popular will, it is truly abnormal that a reversion should be under way which threatens to control the power of that very popular will. But while legislators derive their functions from the people, they are more frequently than not susceptible to corporate than to popular influences. This is one of the most portentous anomalies of American politics; the causes are explainable, but they cannot be enumerated here.

The reversion shows not so much of a desire to lessen the demoralization of political chicanery as it betrays a distrust of the masses of voters. These are slight and almost imperceptible forerunners, it is true. Manhood suffrage and popular forms seem at present irremovable in their entirety. But the student of human affairs knows too sadly that few ideas born of selfishness and prejudice are ever so completely extinguished that they cannot have their upward way again; and that no idea grounded upon the same motives is ever so feeble in its infancy that it does not contain explosive possibilities. The constant dissemination of the view that the masses want dishonest government is bound to percolate through a consequential part of the community; and when this view coincides with the precise drift of current industrial and social tendencies of the great corporate interests it cannot be dismissed as academic, nor can discussion of it be held a hazy speculation. It is a nascent factor that must be reckoned with.

But is it a correct view? However much it may seem so on the surface, the underlying facts do not sustain it. Too long has it been the fashion to throw the onus of bad government upon what are known generically as the masses. The facts show incontrovertibly that it is the large propertied class, not individually, but as a class, that specifically wants dishonest government for mercenary considerations, and that while the masses, so-called, may and do vote for corrupt men and organizations, it is not because they want corrupt administrations, but for other reasons which to them seem paramount.

A study of the basic conditions in American cities reveals at once the accuracy of this statement. In chartered powers and political complexion the administrative organization and control of the different American cities varies. But whatever these dissimilarities, all, or nearly all, of the cities present one conspicuous aspect in common. Whether it be of the first or second class, there is scarcely a municipality which is not assailed by maladroit influences aiming to divert the functions of government to their private profit. In boss-ridden cities it is to be expected, as a natural sequence, that the domineering politicians and their swarms of henchmen regard spoils opportunities as their allotted perquisites. They avowedly are not in politics for salubrious or altruistic purposes. To them politics is a trade, a business and an investment combined. Every one knows it; and they stand out in the open, visible and vulnerable. At any municipal election a popular onslaught can deprive them of much of the power which they abuse and in which they traffic. It is not this class which is insidiously antagonistic to good government. It is the unprincipled property owner, business man and corporate influence. By these any means of ex-

ploiting government for mercenary ends is accounted legitimate in the name of business. It is not a class organized in either a political, commercial or social sense. Composed of a variety of distinct interests and influences its membership, so to speak, is detached, but it is unified by a common, impelling, preponderating motive—that of rancorous opposition to any administration whose integrity bars the way to plundering enterprises and whose plan of enforcing the law impartially cuts in upon its power and its revenues. To say that this class, as it may be termed, comprises all the large propertied men would be both an exaggeration and an injustice. In every community there are many notable examples of men of large means who, animated by a high sense of civic duty, are militant against bad government. Business interests, however, in the largest sense, are not conducted for sentiment or principle, but for profit; and that kind of government which insures the least expense and the largest gains is the kind most desired. On the boards of directors of corporations are usually men of opposite political attachments; yet, divided in opinion as they may be on political issues, they seldom fail to be a unit in sanctioning any policy calculated to increase dividends. The view that the profit and loss ledger takes precedence of all other considerations is so general in business circles, especially among corporations, that it is well nigh the prevailing view. That duality of standard, so pronounced in American life, one standard for the regulation of purely private and another for that of business and political activities, is here evident in all its complex influence. A man may give millions of dollars for philanthropic purposes and yet in business may resort to methods which no code of the most primitive morality can approve. The malign effect of this double standard is clearly seen in municipal, not to mention State and national politics. Men who occupy a position of "respectability," and often are lauded as examplars of piety and philanthropy, will not hesitate to get by corrupt means special privileges in the form of public franchises. They have no scruples in overcharging cities for the public utilities they supply, in evading their legal obligations or in using city property and utilities without proper payment. They will prefer to bribe rather than be compelled to obey laws and ordinances, the enforcement of which means a trenching upon their pocketbook; they will not hesitate to perjure themselves in order to escape just taxation, and they have no compunction in contributing heavily to any freebooting political organization which will guarantee them official favors, connive at their designs or assure them privileged laxity.

As this class is not confined to New York City, the facts set forth here are applicable in greater or lesser degree to every American municipality.

It is not necessary to draw upon the comparatively remote past for proof that this class does not want honest government. It is not necessary to enlarge upon the times of Fernando Wood and Tweed when (so it is a matter of record) the most powerful accessories and supporters of those looting administrations were eminent business and financial men who profited by maladministration. It is not necessary to refer to the long nauseating account of the securing of public franchises in New York City, nearly every one of which was indisputably obtained by bribery and the grantees of which in many cases were pillars of respectability and leaders of public opinion. It is not necessary to advert at length to the long-standing annual farce, when property owners of high standing rush to the tax office and swear away their assessment or hire go-betweens to arrange a reduction. I shall simply collocate a few of many facts disclosed by Mayor Low's recent administration and by the recent municipal campaign.

It is well known that Tammany Hall had a truly colossal campaign fund. Who supplied it? It was an open secret that it was supplied principally by some of the great corporations and by large propertied individuals, particularly those which come into contact with the contracting, taxing, or other functions of the city government. For what object? Because Mayor Low's administration insisted upon the city getting its rightful dues and upon the enforcement of the

tax, building, sanitary and other laws and ordinances. Honest administration was expensive to those hostile elements. They could not bribe, bully or use it.

Evasion of taxes by a major part of the large propertied classes has been a continuous practice for years under corrupt administrations. It has been estimated that from 1898 to 1901 the annual loss to the city was fully $20,000,000. The individual defrauders are so numerous that it would be impossible to deal with them in detail; and their yearly pleas and scheming to get their assessments reduced to a trifling sum or expunged is so notorious and so persistent a scandal that the mere reference to the practice will suffice to bring it freshly to memory. As with individuals so with corporations; and among the corporations the most flagrant offenders are those which have enormously valuable special privileges in public franchises for elevated and surface railways, gas mains and electric subways and telephone and telegraph conduits. The franchise value of these various corporations in New York City cannot, at a moderate valuation, be less intrinsically than $700,000,000. Not only does the city get not more than $443,000 annually for these franchises, but for decades many of the companies have refused to pay the taxes claimed by the city. Under Tammany administrations no serious action was taken to make them pay up; but Mayor Low's administration proceeded to vigorous action. The Manhattan Railway Company (now the Interurban Railway Company), for instance, was compelled to pay $752,524.50 for taxes which that company owed, beginning in 1895. The corporations controlling the street railways in various parts of the city were forced to pay large sums representing arrears in car license fees for different lines. The law compels certain street railway lines to take out car license fees and the franchises of those lines call for a payment of $50 license for each car. For the first time in many decades this law was enforced in Mayor Low's administration. Suits were also begun against the corporations owning the transit facilities for nearly $2,500,000 for percentages on gross receipts, or for car license fees, or (in the case of the street railways) for paving between the tracks. The total amount the franchise holding corporations in New York City owe the city is nearly $16,000,000. This includes the special franchise tax provided in the act passed when Theodore Roosevelt was Governor. For signing that act Mr. Roosevelt incurred the enmity of the powerful corporations, and his nomination for Vice-President was as much due to the designs of the corporate, backed by the political, powers, to immure him in a position where he could do them no further harm, as it was to his personal popularity with the voters.

The fear of the corporations in question of an honest administration is not solely based upon their aim to evade just taxation. Nearly every public franchise in New York City has been obtained by bribery, and with provision for little or no returns to the city. An honest administration will not surrender the city's rights without full compensation to the city. Mayor Low's administration consulted the public interests at every turn in awarding public franchises. For three franchises—those for the Pennsylvania tunnel, for the New York Central improvements and for surface railways in the Bronx—Mayor Low's administration secured an annual payment to the city of $250,000. This is 60 per cent. of the annual amount which all the other railways in the city, steam and surface, yield to the city. But, however much this achievement was a model civic one, it was far from being satisfactory to the corporations. They prefer the Tammany method. The simplicity of this method is well known. When Tammany is in power, all that is necessary to get a public franchise is to give the "boss" of Tammany Hall a block of stock and orders are given to the faithful to vote the franchise through. This method costs something, it is true, but it costs far less than the annual amount an honest administration demands for the city treasury in return for the franchise.

While, on the one hand, these corporations aim to secure valuable franchises for practically nothing and evade their obligations and taxes, on the other, some of them, by means of corrupt official action, wring from the city treasury an enormous tribute. The Consolidated Gas

Company is an instance. This company controls all the gas and electric light facilities in almost the entire city, and, as shown by numerous expert reports, is vastly overcapitalized. In its own report, issued when it was formed of a number of independent companies in 1884, it rated the value of its franchises alone as worth $7,000,000. They are worth now probably $40,000,000 at their real value. For these franchises to use the streets the city gets a few thousand dollars a year. In 1901 Commissioner Monroe, of the Department of Water, Gas and Electricity, caused a thorough investigation to be made. It was found that New York City was obliged to pay an average of from 50 to 60 per cent. more than it ought for electric lamps, allowing for the most liberal profits, and that the city was being charged equally extortionate prices for gas. The city treasury in the course of years had been mulcted in millions of dollars in overcharges. The rates charged by the lighting monopoly were so excessive that Commissioner Monroe suggested, and Mayor Low and the Board of Estimate and Apportionment approved, a scheme for the creation of a municipal electric lighting plant. But the bill to legalize this was defeated in the Legislature, mainly through the efforts of certain Tammany Senators.

But these are not the only predatory methods of corporations. The records of the Water Department show that the city is both overcharged for utilities supplied by private agencies and, in turn, is defrauded of large sums for utilities supplied by the city. The Grand Jury in Brooklyn in November, 1903, handed up a presentation sustaining charges made by Deputy Water Commissioner Van Iderstine that the American Sugar Refining Company (popularly known as the Sugar Trust) had been using water from unmetered taps to the value of $525,000 within five years; and the Grand Jury recommended that the Corporation Counsel take steps to collect that amount. This amount, however, is but a fraction of the total of which the city has been defrauded by the theft of city water. Commissioner Monroe and his subordinates discovered a sufficient number of cases indicating that the city has lost millions of dollars in this way. A large number of tug boats, for example, were running as low pressure boats, paying but $45 a year, altho they were high pressure boats, for which the rate is $90 per year. Many of the tug boats stole and sold city water, and should have paid $25 a month to the city. A common fraud under Tammany, and one which is costly to the city, is the giving by corrupt officials of permits for the use of hydrants without any payment. In one case it was found that a well-known contracting company favorable to Tammany had its permits to use city water extended year after year without making any payment for the water used. It is needless to enlarge further. In the Department of Water Supply, Gas and Electricity alone, many kinds of frauds, costing the city millions upon millions of dollars every year, were discovered and stopped under Mayor Low's administration. In nearly every case the beneficiaries were corporations or large propertied individuals.

Contrary to the general impression, the tenement houses in New York City are not, as a rule, owned by large estates. That department will be passed over; and an observation taken of the Building Department. It is in this department that the large building corporations want officials who will be susceptible to the "proper arguments." The laws requiring fire proof and otherwise sound and safe buildings are very strict; to meet their requirements entails large expenditures. It was only recently that an ex-Superintendent of Buildings said publicly that it would have been an easy matter for him to have made a million dollars a year corruptly; and this same official told the writer that he had had many opportunities to make $100,000 from the erection of a single large building. It will be asked how. The explanation is simple. The great contracting companies would eagerly pay $100,000 in bribe money to escape strict and lawful requirements that would cost $150,000. It would be a clear gain of $50,000, and the public would never be the wiser.

The enumeration of many instances of this spirit of the large propertied classes would be monotonous and would not add to the convincing effect of the

specific cases given. In nearly all the city departments the record is the same; varying, of course, according to the nature of the opportunities and operations.

While the large propertied classes, as a class, want dishonest government for purely mercenary ends, the masses, as a whole, do not. A portion of the population undoubtedly prefer a "grafting" administration, yet at best it is but a fragmentary part of the entire electorate. The majority often votes for Tammany rule; in doing so it does not register its demand for dishonesty. It is actuated by other considerations—by partisan appeals or bias, by opposition to narrow excise, by objections to particular policies or candidates, and by a multitude of other interlacing reasons which no sophistical arguments can construe into a call for dishonesty. The large propertied classes, however, want dishonest government as a tangible, pliable, immensely valuable asset. It means money on a great scale to them. Mainly from them Tammany derives its millions of dollars in campaign funds. Proceeding upon the famous rule of Jay Gould, "I contribute to the Democrats in a Democratic county and to the Republicans in a Republican county," they know no political barriers in their invidious business methods, but support that dishonest organization everywhere which has a dominant hold and which fortifies them in their frauds upon the government and the people.

Who, with an understanding of our underlying political conditions, can doubt that it is the large propertied classes who are the real enemies of good government?

New York City.

Japan's Claims Against Russia

BY TOYOKICHI IYENAGA, PH.D.

[The author of the following article is a lecturer in the University of Chicago. While, being a Japanese, his article gives the Japanese view of the conflict between Russia and Japan, it will be of particular value because it presents so clearly the fundamental questions which underlie that conflict.—Editor.]

BROADLY stated, the Japanese contention in the present Russo-Japanese controversy cannot be less than the complete assertion and the immediate practical application of the principle insuring the preservation of the Chinese Empire and of the Korean Kingdom, and of the principle of the "open door" in those countries. To be more specific, the points of contention may be stated thus: Manchuria to be, in name as well as in fact, under the suzerainty of China; the *status quo* of Korea not to be disturbed; freedom of commerce and trade within those countries, and a mutual agreement guaranteeing certain special rights, privileges and economic interests of Russia and Japan in Manchuria and Korea respectively.

Among the points enumerated the most vital of all is the settlement of the Manchurian status. Some Americans seem to raise the question, Why is the Manchurian question so vital to Japan? Why is the latter so anxious to contend for the preservation of the territorial integrity of Manchuria, and not be satisfied with the safeguarding of the commercial interests of Japan in the region? There is but one answer to it. Because the most vital, cardinal, crucial principle is involved therein. Because upon it hangs the future of China. Because once the annexation of Manchuria by Russia is admitted, the whole political fabric of China, tottering as it is, but still able to keep its ground, will go to pieces. In other words, the fate of Manchuria means a far sadder, far weightier disaster than the loss of three northern provinces of

the Chinese Empire; it means the introduction of the policy of partition of China. Then, again, the fate of Manchuria involves the wreck of the "open door" policy in China. Mr. Hay, Secretary of State of the United States, saw with his far-seeing eye, and expressed in 1902 in his emphatic language, the danger involved, when Russia tried to extort from China certain special privileges in Manchuria:

> "Such a concession on China's part would undoubtedly be followed by demands from other Powers for similar equally extensive advantages elsewhere in the Chinese Empire, and the inevitable result must be the complete wreck of the policy of absolute equality of treatment to all nations."

Without China there can hardly be an "open door." Without Manchuria there will ultimately be no China.

Before the eyes of the American public and of the world the Korean question has been brought to the forefront in the first stage of the present Russo-Japanese negotiation, as if it formed the bone of contention. Such an impression is due to the diplomatic maneuver of Russia. In fact, she has tried her utmost to divert the attention of Japan and of the world from Manchuria to Korea. Russia showed great activity along the Korean side of the Yalu, opposed the opening of Yongampho, and it was once rumored she constructed quasi-forts in the place. This could be only interpreted as a shrewd move of Russia to strike a diplomatic bargain with Japan, and thus to dupe the world. "Behold! I allow you a free hand in Korea," Russia counted on saying to Japan; "you must, therefore, allow me a free hand in Manchuria." And, turning to the world, she thought to exclaim, "I have made such and such concessions in Korea to Japan. But she remains obstinate; she is the disturber of the peace of the world." By putting Korea as a bait, Russia simply tried to soothe Japan and cause her to acquiesce in the Russian occupation of Manchuria. The world has been already informed that Russia even proposed a neutral zone in Korea. To Japan, however, the Korean question is nothing but a side issue. As Japan is fully cognizant of the fact that her predominant interests in Korea, political, commercial, financial, are well acknowledged by the world, and further, as she has no intention whatever to annex the Peninsular Kingdom, such a proposal of Russia, it is needless to say, was rejected without a moment's consideration by the Tokyo Government.

The Cabinet of St. Petersburg being thus put at its wits' end, seems to have now turned to the last resort of enlisting the sympathy of the world on her side, by convincing the latter of her most peaceful intentions, and by showing Japan in the light of an aggressive, warlike Power. Within the past few weeks, from St. Petersburg, Paris, Berlin, telegraphic reports have issued forth, bringing many emphatic assurances of peace. It was even reported that the Czar declared to his Ministers on the Russian New Year's Day that "it is his desire and intention to maintain peace in the Far East," than which, the *Novoe Vremya* declares, there can be be no better assurance of peace. If this be sincerely said, if peace can be maintained in the Far East, nothing can be more welcome to Japan. But are we justified in placing implicit faith in this peace-assuring news, emanating from St. Petersburg? We, who are sojourners in this country, and are naturally watching with the keenest interest and anxiety the development of events in the Far East, have some reasons, until we are fully assured by the official reply of Russia, not only to hesitate to accept this news, but even to doubt whether there are not some sinister designs on the part of the Northern Power in propagating these peace-assuring rumors. Are they not intended to be used as the weapon of the Russian diplomacy, to further its plan, and thus ultimately to triumph over Japan? In other words, is not Russia trying to dupe the world again? Let me state the reasons for suspecting this.

That Russia finds herself to-day in the gravest and saddest of dilemmas is apparent to all. Shall she fight Japan, or acquiesce in the loss of all the glorious prestige she has established in the Far East? Her magnificent diplomacy of the past century, that enabled her agents, from Muravieff to Cassini, to play such a splendid *rôle* in Eastern Asia, that succeeded in extending the Muscovite influence from the bank of the Amur to the Great Wall of China, in driving shafts through the heart of Manchuria, and in stationing the Russian floating

iron-sentinel at the entrance of the Gulf of Pelchili, thus seizing the very throat of China, the diplomacy that seemed destined to surmount every obstacle in its triumphal career until the eighteen provinces of China should bow meekly to its command,—this diplomacy has at last in the dawn of the twentieth century met its check. The pertinacity of Japan to preserve the integrity of the Chinese Empire, and the awakening of England and the United States to the real danger of the Muscovite domination, stand to-day almost insuperable obstacles, far mightier than the Great Wall of China, against the aggressive movement of Russia. For the latter the present is, therefore, the most serious moment in her history. No wonder that her diplomacy is making the most desperate attempt to break down this combined barrier, and to find its way.

However ominous the frowning cannons of Japan may appear to Russia, what pains the latter most is the sympathy the former has obtained from Great Britain and the United States. This sympathy has not only been expressed in words, but was manifested in an unmistakable way in deeds, as, for instance, the purchase by England of the Chilean warships, and the hurried ratification of the treaty between China and the United States. Profoundly grateful Japan certainly is for these marks of sympathy by the English-speaking nations; there is in this, however, nothing unnatural, unreasonable. For not only can Japan claim justice on her side, but the interests she is striving to safeguard are also the interests of the United States and Great Britain. For the principle of the policy Japan is pursuing with relentless energy is that which was laid down in the most explicit, forcible and unmistakable tone in the circular of Secretary Hay of 1900, and which forms the basis of the Anglo-Japanese Agreement of 1902. In this respect Japan is now only acting the part of a spokesman of those nations.

However reasonable may be the sympathy manifested by England and America toward Japan, it cannot but be extremely galling to Russia. She must, therefore, realize that the first step to clear the way for the success of her diplomacy must be to alienate this sympathy from Japan. Among many resources of the Russian diplomatists, one would be to convince the world, if possible, of the most peaceful attitude of herself, and to show Japan on the other side, in the light of an aggressive, warlike, unyielding Power. We are led to suspect whether this is not the course the Russian diplomacy is pursuing before the reply to Japan's last note is delivered. It serves, again, another purpose when the Russian note is delivered to Japan, that of inducing the latter to minimize her demands, and yield to Russia. If this cannot explain the sudden change of the Russian attitude, as reported by the telegraphic messages from St. Petersburg, the only alternative for us is to think that Russia has been heretofore playing the big game of diplomatic bluff, to overawe Japan by military display. For the world is too well acquainted with the bellicose attitude of Russia, constructing forts in the strategic points in Manchuria, hurrying there regiment after regiment from Europe, and massing her warships in the Asiatic waters. Shall the world, then, be convinced, by Russian persuasions, of the aggressive nature of the Japanese, and look upon the latter as the heedless disturber of the world's peace?

In the first place, why should Japan prove herself warlike in the present situation? Such a charge might be thought worth considering if Japan threatened war upon such a helpless Power as China. To be pitted against Russia is, however, a different matter. Japan is fully aware that such a struggle with the Northern colossus, one of the greatest military Powers of the world, is a mighty task for her to undertake. She knows that for the conflict she has to strain every nerve, every tissue. Every Japanese feels it in his heart. He knows his honor, property, and even life—all must be put to stake. Rather than plunge into such a dangerous war, is it not reasonable to suppose that Japan will hail with joy the peaceful issue of the present imbroglio? It took Japan, therefore, a long time before she decided to contest the point with Russia to the utmost, even at the cost of war. The diplomatic history from last October to the present time stands a conclusive witness to the peaceful attitude of Japan. Provocation after provocation, delay af-

ter delay, had been the order of the day on the side of Russian diplomacy. Utmost patience, ungrudging courtesy, speedy reply, and most sincere solicitude for peaceful settlement—these the part Japan had to and did play. The time intervening between the forwarding of the Japanese note to Russia and its answer from the latter measures the patience and long-suffering of Japan. *Vice versa*, the speediness of Japan's reply to the Russian note bespeaks the sincere desire of Japan to settle with the quickest dispatch this dispute, which is doing so much damage to the commercial and financial interests of the world. This long suffering on Japan's side almost argues lack of intelligence for the strategic art. For every hour, every minute, of delay is gain to Russia, and loss to Japan. In face of these facts, can we be persuaded that Japan is needlessly provocative of war?

CHICAGO, ILL.

"The Post Office, Our Mutual Transportation Company"

BY JAMES L. COWLES

[When the author of the following article found himself, in 1888, under the ruins of two factories whose failure had been largely due to discrimination in freight rates, he took up the solution of the public transport problem as his life work. He quickly saw the close relation between the post office and the post road, and in 1891 published his article, "The Application of the Postal Principle to Railway Traffic," in the *Birmingham Age-Herald*. The editor of the *Railway Review*, of Chicago, reprinted the article, and in his editorial upon it said that although the idea would not be received with any degree of favor under private ownership of railroads, under Government ownership it would be a natural sequence. The first edition of Mr. Cowles's book, "A General Freight and Passenger Post," was published in 1896. The third edition appeared in the spring of 1898. This contained the author's theory as to the solution of the transport problem and its application, the latter half of the book being devoted to the support of the bill attacked by Mr. Castle in his late article in THE INDEPENDENT. Mr. Cowles has written many articles for the press and for magazines on his favorite subject, and has aided his friends in Congress to the best of his ability. In December, 1898, he was summoned to Washington as one of the witnesses before the Committee on Railway Mail Pay. He was ill at the time, and his revised testimony was afterward published as a special document by the Senate. A year ago Mr. Cowles organized the Postal Progress League of Boston. He is now at work organizing similar leagues throughout the country.—EDITOR.]

A DEPARTMENT of Posts came into being almost as soon as the first king had extended his rule beyond his immediate vision. The old time posts served as eye and ear, hands and feet to the old time ruler, at once acquainting him with the plans and movements of his subjects, transmitting to them his orders, transporting from them their tribute.

This royal post office, established as a means of espionage and taxation, arrived at its full perfection in the Cursus Publicus, the Letter, Freight and Passenger Post of Imperial Rome.

Says the historian Nadet:

"In our modern Europe the posts, with their liberty of land and water transport, are a source of incalculable prosperity to the people. They are the arteries of commerce. In that ancient world they not only added another instrument of servitude to so many others, they also enfeebled and impoverished the provinces, crushed less under the weight of the legal imposts than by the iniquity of the assessments and by the exactions for which they served as a pretext. Besides the members of the Imperial Court, the magistrates and the commanders of the troops, there were the soldiers and servants of the magistrates who took the horses and cattle of the farmers. There were also the directors of the stations in the cities and upon the routes who invented every species of extortion. Added to these were the nobility of the cities, the chiefs of the councils, all the powerful, indeed, who forced the poor of city and country, *plebs urbana, plebs rustica,* to furnish them free

transportation for themselves and for the materials with which they built and decorated their palaces and their villas. For, under the protection, real or simulated, of the great official tyranny, the local tyrannies desolated the country. Thus, thanks to the *régime* of despotism which always perverts the best things, it becomes necessary to rank among the principal causes of the depopulation and ruin of the empire the Imperial Posts."

There is a lesson in this story that the modern American may well heed. The rapid consolidation of our systems of public transportation and communication —our American Cursus Publicus—means the quick establishment of a railroad despotism here, as much more dangerous than was that of Imperial Rome as the modern transport tax is mort artful, more subtle and more searching than was any other form of taxation ever invented.

"The present system of making railway rates," says Interstate Commerce Commissioner Prouty, "is taxation without representation in its most dangerous form." (Letter dated January 12th, 1903.)

Its continuance means the quick throttling of private enterprise, the quick degradation of the private citizen, and the ever increasing corruption of the public servant. It means the rapid enrichment of a single imperial railroad family and the quick impoverishment of a great people. The fearful waste of the system is illustrated by the recent destruction of the Western Union Telegraph lines by the Pennsylvania Railroad. Its dangers are illustrated by the recent increase in the taxes levied by our imperial rulers, increase in railroad rates, express rates, telegraph rates. The Coal Combine brought still other dangers to our notice by acknowledging their power to control the cost of our fuel and our light. The one barrier in the way of this threatening imperialism is the Public Service Post Office.

There is an irreconcilable conflict between the Public Service Post Office and the Public Exploitation Post Road. They cannot continue to exist together. One of the two must absorb the other. The chief end of the one is public espionage and public taxation.

Its principle of taxation is "What the subject will bear." The sole end of the other is the public convenience, the public security, the public prosperity. The absorption of the post road by the post office, with its inevitable sequence—tolls low, uniform, stable; tolls determined in open congress on the postal principle, with the very lowest existing rate for the shortest distance, the uniform standard rate for all distances—means ever widening opportunities at once for the development of the individual and for the advancement of the public welfare.

Railways are—by law—post roads. Railway cars are traveling post offices. Railway stations are, by necessity, stationary post offices, points where mails are exchanged between the traveling post offices of the great railways and the elevated railway, trolley, automobile and horse wagon post offices on which postmen should be employed, collecting, assorting and delivering as the post office moves on its course to and from the railway stations and the homes, factories and shops of the people.

A perfect postal system means house to house collection and delivery throughout our own domain and the extension of our domestic rates to all the world; this for persons, baggage and merchandise, with steadily improving machinery and steadily diminishing tolls. It also includes the service of the telegraph and the telephone, with steadily decreasing rates for the transmission of intelligence. The circulating and nervous systems of the body politic must be under one and the same public control.

A parcel and passenger post is even now in course of evolution on our free rural routes, where barrels of flour, sacks of grain and human beings as well are transported in ever increasing numbers on the carriers' vehicles.

This business, now carried on outside the control of the post office, at uncertain rates determined by the carriers' wills, can be carried on with infinitely greater advantage at once to the carriers and to the public under the post office, with rates low, uniform, the same to all.

In Carroll County, Maryland, 64 post offices and 33 star routes have been discontinued.

"In counties where rural delivery is established as a complete system, only post offices on railroads remain. Wherever the county service is established, star and special messenger service are practically wiped out alto-

gether, and as soon as the system is universally extended throughout the States in which complete establishment of rural service is practicable, practically all the star-route service within that territory will be discontinued."
—P. O. D. Report, 1902.

In 1896 Second Assistant Postmaster-General Shallenberger said that more and more of the assorting work formerly done in city post offices was being transferred to postal cars; in 1897 he told the Senate Appropriation Committee that he hoped to see the car and wagon dispense altogether with the big city post offices. The possible savings to be thus effected are apparent.

In 1837 Rowland Hill laid down the axiomatic principle that on a great transport machine like the post office, engaged in general traffic, the cost of the transport service was practically the same for all distances. Often, indeed, the transport of the shortest distance local packet cost far more than that of the longest distance through packet. In 1839 Mr. Hill established the English Penny Letter Post, making the very lowest existing rate for the shortest distance, the uniform standard postal rate for all distances within the British Isles.

As the intervening years have passed this principle of uniform rates has been steadily extended to merchandise packets of ever increasing weight and over ever widening territory. The World Letter Post Union came into being in 1875; 1880 saw the birth of the International Parcels Post Union carrying parcels up to seven pounds. In 1885 the weight limit was extended to eleven pounds. The same year saw the establishment of the American Periodical Publishers' Cent-a-pound Merchandise Post, under which registered periodicals and newspapers (as much merchandise to the publisher as sugar to the grocer) are taken in 150 to 220 pound mail sacks and, where free delivery exists, save in the cities of publication, are delivered at the address practically anywhere within the habital limits of North America, the Philippine and Sandwich Islands, and since June 1st, 1903, in Shanghai and several other cities of China. The Canadian periodical publishers send their registered merchandise throughout the United States and Canada at a cost of but ½ a cent a pound.

Within the combined area of Germany and Austria-Hungary, ordinary 11-pound merchandise packets are posted distances up to 10 geographical miles for 6 cents and greater distances for 12 cents. In Great Britain, the uniform rate on an 11-pound packet is 25 cents; in France on a 22-pound packet, 25 cents, and such packets are interchanged between France and Switzerland for 30 cents. Switzerland carries 11-pound packets from any Swiss post office to the address for 8 cents, 44-pound packets for 33 cents.

The United States express companies, by their power in Congress, have limited our ordinary merchandise packet to 4 pounds, on which the tax is 64 cents. Under their influence, Mr. Roosevelt's administration has just cut down the limit of our parcels post with Germany from 11 pounds to 4 pounds 6 ounces. The principle of uniform rates is widely applied on our trolley lines.

Its extension to general transport, says the editor of the *Railway Review*, of Chicago, will be a natural sequence of Government railway management. It will, indeed, be little more than the legal enforcement of a wide spread and long established railway custom that altogether ignores distances in through competitive traffic.

What neighborhood railway rate is lower than the 40-cent tax on 250-pound flour sacks, Minneapolis to Liverpool, or the 13.2 cents a barrel tax on flour for the 429-mile railway haul, Ogdensburgh to Boston, or the 28-cent a barrel tax, Chicago to Boston.

Postmasters-General Vilas and Wanamaker had most comprehensive plans for postal advancement. Mr. Vilas demanded the Government ownership of postal cars, claiming that it would save to the Government the full value of the cars every year. Mr. Wanamaker demanded postal savings banks, a postal telegraph and telephone system, free collection and delivery, house to house everywhere, the extension of our ordinary domestic merchandise post to 11 pounds. Said Mr. Wanamaker:

"A one-cent letter rate, three-cent telephones, ten-cent telegrams are all near possibilities under an enlightened and compact postal system. The Parcels Post is a success wherever it is in operation, and the vast majority of the people appreciate it. In point of

fact, there are but four objections to the Parcels Post, and they are the four great express companies."

Under the leadership of Col. Albert A. Pope, manufacturer of the Columbia Bicycle, the New York Postal Progress League—the name will be changed presently to American Postal League—takes up the old plan of Mr. Wanamaker and proposes the enactment into law this winter of the following proposition:

The consolidation of third and fourth class matter, with an 11-pound limit and rates, as follows:

On parcels up to 3 ounces, 1 cent.
Over 3 and up to 6 ounces, 2 cents.
Over 6 and up to 9 ounces, 3 cents.
Over 9 and up to 12 ounces, 4 cents.
Over 12 ounces to 1 pound, 5 cents.
On larger parcels, for each additional pound or fraction thereof, 2 cents; on an 11-pound parcel, 25 cents.

These rates are to insure unregistered parcels up to $10. On registered parcels the regular fee of 8 cents extends the present $25 first-class insurance to all postal matter. The payment of an additional fee of 2 cents per each $50 insurance will secure an indemnity to the value of the parcel. It is proposed that these rates shall cover authors' manuscripts, commercial papers, etc.

The coming long session of Congress preceding the national elections offers a rare opportunity to secure the enactment of this proposed bill into law. The Congressman and the Senator who becomes sponsor for it will surely win a host of votes. Its passage will be of incalculable advantage to our people. It will check up the steadily increasing transport taxes on business and on enterprise. It will largely diminish the expenses of our public institutions.

The advancement of the post office may well be made the leading issue in the coming elections.

New York City.

A Love Song

(SEVENTEENTH CENTURY)

BY DUNCAN CAMPBELL SCOTT

It is not I alone,
  But all the flowers that love thee;
They hoard their hue and honey up,
  And strive to prove thee
    The fairest of their train;
      They try
    To vie with thy lip's ruby stain,
      But fade and die.

It is not I alone,
  But all the stars that love thee;
They gather in the early dark,
  And bend above thee
    With all their twinkling light;
      They try
    To mock thy glances in the night,
      But pale and die.

It is not I alone,
  But all the seas that love thee;
They heap their ambergris and gold
  And strive to move thee;
    Or rocking, with their tides at rest,
      They try
    To counterfeit thy heaving breast,
      And ebb and die.

It is not I alone,
  But all the world that loves thee;
It is because thou art so fair;
  And as behooves thee,
    Thou and the world are one in heart,
      And try
    Each to be other, beauty's counterpart,
      Nor fade, nor die.

Ottawa, Canada.

Confessions of a Country Mouse in the City

[To fit pebbles of all sorts and sizes into a compact, level mosaic pavement requires a long process of attrition which doubtless makes the pebbles feel very uncomfortable for a time. The feelings of human beings subjected to a somewhat similar process are voiced in these fragmentary "confessions" by a woman who has just begun living in New York. They are further discussed in our editorial pages.—EDITOR.]

In a small town one is a personage, or, at least, a personality. Here, one is an atom—an eddying drift of star dust.

The houses remind me of rows of cubical cells. Their insect inhabitants may be wasps or bees, I know not. Cliff swallows, perhaps; but, no! they come and go and do not chatter to each other as the swallows do.

I am never lonely in the purple hush of the hills, or the dim green silence of the forest, or of the tawny unpeopled plain; I am desperately, horribly alone in a crowd.

How long shall I be in acquiring the hard and brilliant gregariousness of the *boulevardier*. It is a profession like any other. Simple human friendliness is all I have known hitherto.

A highly polished surface reflects, but does not transmit light.

I am busily engaged in growing myself a shell. None but crustaceans can survive in the city. I find the country dweller is too sensitive. Every sense is painfully awake. It has responded, in the past, to so few stimuli, that it was not necessary to be callous or unheeding. Sympathy, quick to help, is the rule in country life. But here! One who would listen to every wail of hurt children, who sees every horse or automobile bearing down upon them, would soon die of the awful strain. The city dweller, who would survive, grows a shell of indifference to everything which does not immediately concern him; sees and hears only what he wishes or needs must.

Yesterday, a young man deliberately sat him down on the icy door step opposite, and, taking a book from his pocket, began to read. He wore no gloves, his hands were blue with cold, his breath smoked in the frosty air. At home I should have walked straight across the street and asked him why he chose to sit on an icy step, with the mercury at zero, to read his book. As it was I feared to interrupt some cherished custom of the insane city. There might be some occult reason for the act, and I might—probably would—have met that look of cold suspicion which makes me shrivel up and wish myself back where I am known to be respectable. Yet that young man will haunt me for days to come. He *might* not have repelled a sympathetic question and he may have been in need. He sat there for an hour. I shall always regret that I did not cross the street.

Why do city people always assume a stranger to be a dangerous character until he has been introduced? It would be so much pleasanter to hold the opposite theory of his inoffensiveness, which, in the majority of cases, would be true!

I do not like to have my toes trodden upon in the trolley cars. I don't mind hanging on a strap for hours at a stretch if people will only let me do it with dignity and serenity.

I take more comfort in the children than in any one else. You can smile at a child without his fancying that you are trying to pick his pocket.

Why do women so bitterly resent being told that their attire is awry? Tell a woman that her belt is unclasped and the glare you get suggests that she suspects you of designs on her watch. I have come to the conclusion that I will let these ladies fall all to pieces rather than run the risk of their *hauteur*.

I am so tired of pretense! Of beds that pretend to be bookcases or pianos, of safes that pretend to be something

else, of fire places that never "go," of people who pretend to be wise, or rich, or socially important when they are none of these things! Oh, for an honest bed, standing on four sturdy legs and not masquerading as anything under the sun except a bed.

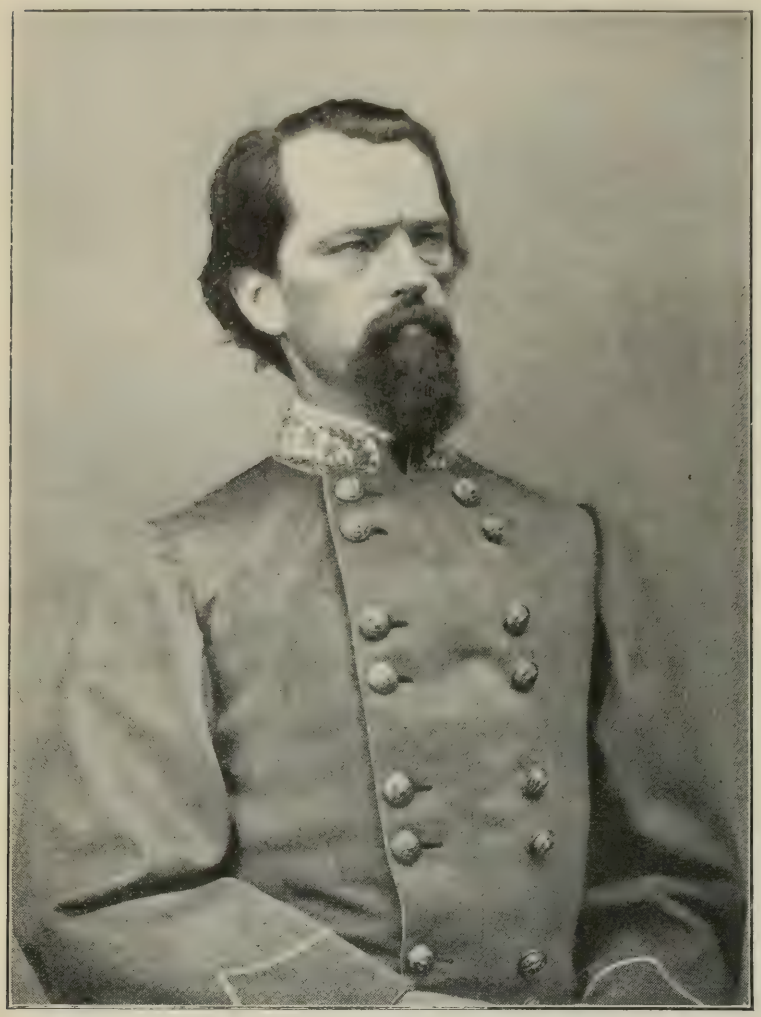
When have I seen a happy face? Occasionally, I see a good one, but it is marred by unrest. Most of the faces in the crowds are masks and tell nothing at all. They might as well be veiled.

Why should it oppress me so to think that there are nearly four million people within a radius of a few miles? It has never crushed me to the earth to be conscious of eighty millions of fellow inhabitants in the United States. But they have not pressed so near. My imagination can people vast spaces without growing faint or weary of wing. It cannot a few square miles.

I wish I could rid myself of the idea that the rows of wistful faces I see looking out of the upper story windows along the elevated roads are *locked in,* and cannot get out!

General Gordon and General Longstreet

BY CLEMENT A. EVANS



[General Evans is second in command of the Confederate Veterans and is author of a "History of the Confederate Veterans" and several works on the Civil War. He is now a member of the Prison Commission of Georgia, and both from his official position and from personal acquaintance, he is probably the best qualified man living to write of his two friends. The following article was obtained for THE INDEPENDENT from an interview.—EDITOR.]

IT seems quite singular that John Brown Gordon and James Longstreet should have passed over the river so soon the one after the other. At the close of the war these men stood respectively as Lee's left wing and right wing commanders.

The two were vastly unlike in appearance and characteristics. One fought with such dash and decision that he

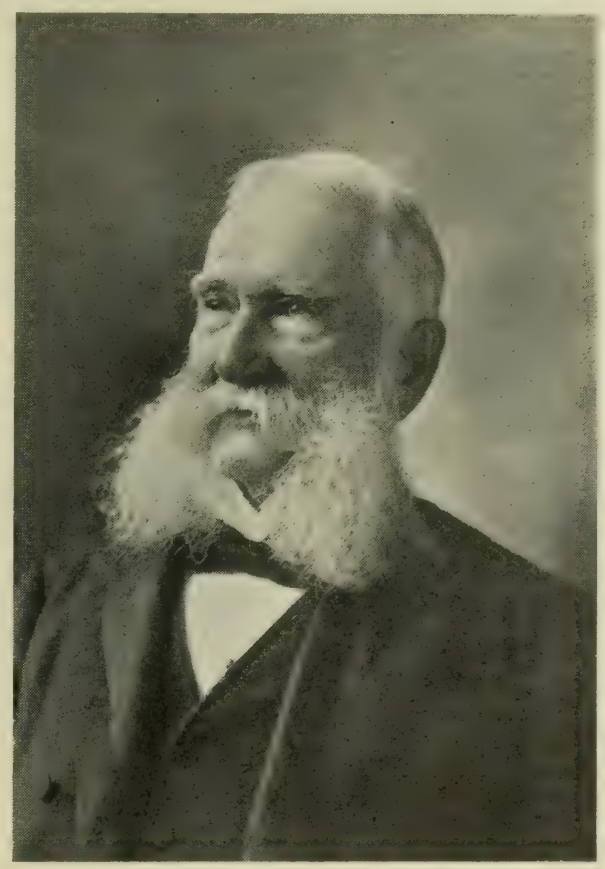
Author of "Reminiscences of the Civil War." Copyright, 1903, by Charles Scribner's Sons

would have been noted wherever he might chanced to have fought a battle or led a charge; the other, with bull dog tenacity and precise military style, so characteristic of the English soldier. The two kinds were both needed in our Confederate struggle.

But men were great as warriors and citizens, and were recognized leaders of their people in war and in peace. At the close of the Civil struggle their different temperaments and early training naturally caused them to take different paths, but both worked for the common cause of their section's upbuilding from the effects of a devastating war and the fostering of a patriotic spirit of fellowship and harmony between the sections.



Longstreet was unfortunate in that he allied himself with the party in power, accepting absolutely what were termed the results of the war, seeking to adjust himself to new conditions. This, of course, was not regarded as the proper step, for to the general public it seemed a desertion from the ranks of his friends. Gordon, on the other hand, clung rigidly to his opinions as a Southern Democrat, and never allowed an opportunity to pass in which he might reiterate his belief that the South was right in its position. At the same time, he urged the people to cherish no malice or bitterness, but to accept without a word the true arbitrament of arms and proceed with all diligence to the upbuilding of their depleted fortunes and to the prospering of their own section. This, of course, served to increase his fame and to make him at the time of his death practically "the people's idol."

General Gordon was born in Upson County, Georgia, February 16th, 1832. His education was obtained at the University of Georgia, from which institution he graduated. He was soon afterward admitted to the bar and for a short while practiced law. He entered the Confederate service as a Captain, and quickly rose, step by step, to the position of Lieutenant-General. During the course of the fearful struggle he was shot eight times. He was Governor of Georgia and a United States Senator from the same State. At the close of his life he was a public lecturer and Commander-in-Chief of the Confederate Veterans.

Probably the most notable trait of General Gordon as a soldier was his characteristic of dash. His power to force matters during the progress of a battle to an advantageous climax deserves to rank him as a soldier of no mean ability, comparing favorably with any of the forceful generals of history. His impetuosity was remarkable; and yet his impetuosity of spirit was not carried to such an extent that he was thereby unfitted for the performance of serious duties requiring forethought and caution. Indeed, General Lee reposed in him the

utmost confidence and often gave him most delicate and difficult tasks to perform.

In all the Southern army there was no man superior to him as regards the management of men in actual combat. His quick-wittedness was marvelous. Almost in an instant could he determine the best action to be taken during a battle when an unexpected crisis arose. He was ever ready to act when a change of tactics in actual battle became necessary, and subsequent results proved his ability when quickness of decision was required. Some one has aptly said that Gordon "was always ready at a moment's notice to recognize instantly the best thing to be done when an unexpected situation called for an entire change of tactics." This was a valuable trait of character, for there are generals who do brilliant work and fight well on a set program, but who are confused and put to rout if details are not what they expected.

GENERAL JAMES LONGSTREET

Gordon was not at all Fabian in his conduct of a battle. He never liked and seldom resorted to a retreat movement during the progress of a battle; preferring always a succession of advances while the conflict raged. His uppermost thought seemed always to be, as was aptly stated by one of his friends, "Where and how can I most advantageously attack?"

In some respects his military tactics were like Stonewall Jackson's, especially so in that he was continually busying himself searching for the enemy's weakest point; and, having found it, there quickly delivered his severest blow. His main idea seemed to be to watch for a gap to break through the opposing forces or to find an unprotected flank. He always sought some vantage point where a smaller body could deliver an effective or demoralizing blow upon a larger one. This, of course, was essentially a strong point in a Southern General, as almost universally Southern troops had to meet bodies larger than their own.

Strikingly characteristic of the temperament and whole life of the man was his army discipline. He never relied upon object lessons of severe punishment to keep the standard of his men up to a high mark. Steady improvement of the character and valor of his men at all times was his main reliance for good order and valiant service. While his troops were on the march he exercised a personal watchfulness over them, noting carefully all departments and giving praise or censure wherever it was needed. Altho without military training Gordon drilled his men well. There seemed to have been born within him the ability to handle men. The secrets of the art of successful warfare seemed to come to him naturally.

At the close of the war he laid aside all thought of further military service and bent himself to the task of making a living as a private citizen, with the same degree of energy which had caused him to rise from one place of distinction to another as a leader in the time of war.

In the business world his mind ran on large schemes, some of which were carried through to a successful finish, while others failed. Several times he seemed to be on the verge of making a great fortune; but, unfortunately, he died leaving only a modest sum.

As a lecturer he captivated his audiences wherever they gathered to hear him. In his lecture work there appeared the same spirit of dash and vivacity which were natural traits of his character. By the strong force of his descriptive power and personal magnetism and sympathy he would draw his audiences to the hights upon which he stood, causing them to weep or laugh as he chose.

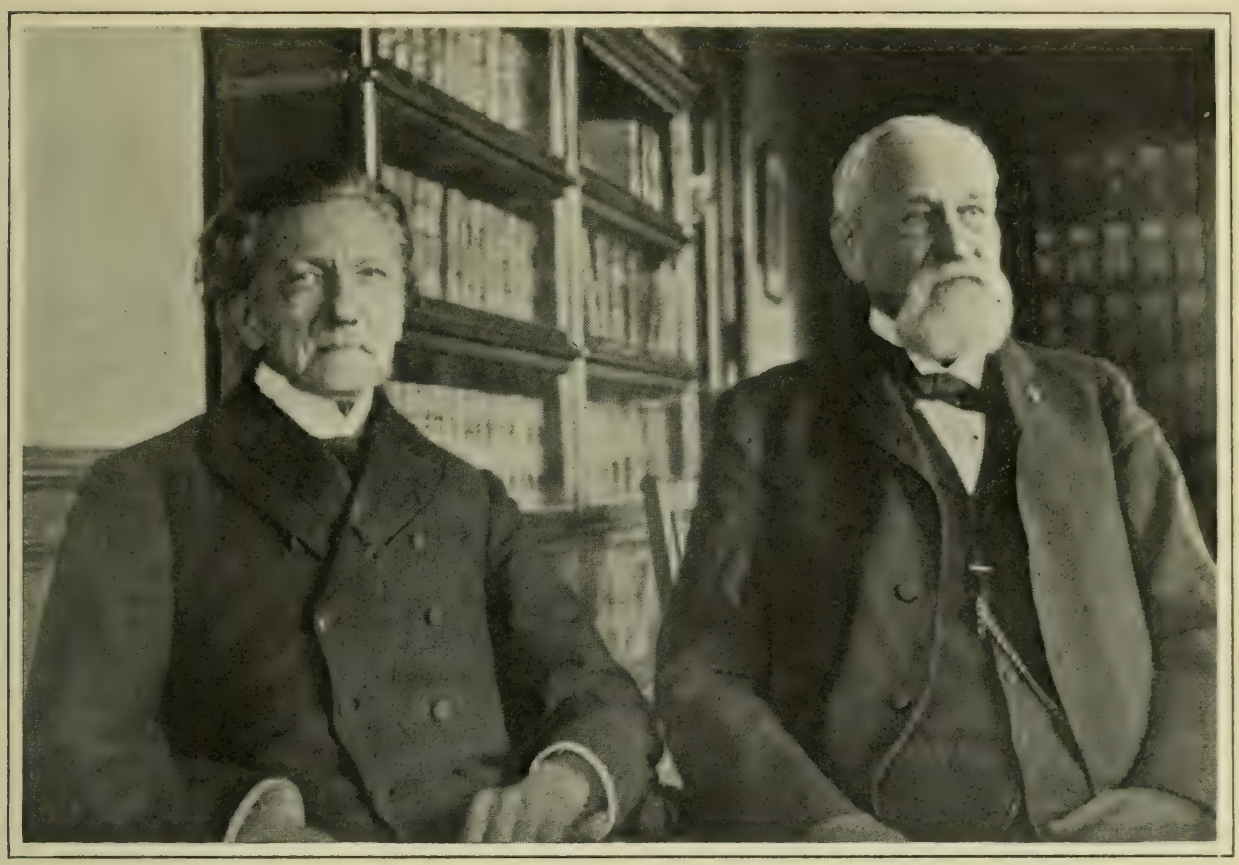
Long before he had thought of preparing his now famous "Last Days of the Confederacy" he was often called upon to make addresses before the people of his native State. The tenor of all these public utterances was to urge his people to cling to their convictions, but to cherish no bitterness because of the result of the terrible conflict. Build up your wasted fortunes and bring back prosperity to your beloved section and assume once again the proud position you have always held in the American Union, was his constant plea. His lecture work gave a great general impulse to the feeling of fellowship and sympathy between the sections. He dealt entirely in facts and incidents in which both sides were equally interested, and valor wherever found, whether North or South, was always given its due. His latest book,* which has just been published, was entitled "Reminiscences of the Civil War."

General Longstreet was born in Edgefield District of South Carolina in the year 1821. He was, therefore, about eleven years the senior of General Gordon. He graduated at West Point in 1842 and served successively in the Mexican, Indian and Civil wars. After the war he became a Republican and was appointed Surveyor of Customs at New Orleans. Successively he held other important public offices, such as Minister to Turkey, Postmaster of Gainesville, Ga., and United States District Marshal of Georgia.

General Longstreet might well have been termed "an English soldier," for he possessed all the notable traits of the English military leader. Unlike Gordon he was probably made a military chieftain by training rather than by natural ability; tho he certainly possessed an unusual amount of military genius. All of his life training had been in the direction of a military career, and he was as often termed "a fighter pre-eminently." He fought with an even steadiness and tenacity so prominently characteristic of the English soldiery.

Looking back over Longstreet's life it can be readily seen that he would have been well suited to leadership in a war in Europe. Undoubtedly he would have made great fame on the field of battle at the head of some European army. His even, steady temperament was not exactly suited to the conditions and surroundings of the average American battle field, and his disposition did not companion well with that of the average fiery Southerner.

His military tactics carried out certain military principles and rules which had been drilled into him and become thus part of his military make-up. He advanced along certain given lines to his climaxes, and no power could induce him to do differently. It is a well known fact that he differed with Lee in the conduct of certain campaigns, and would have carried them on differently. But whether he would have been more successful is very uncertain, inasmuch as Longstreet was far inferior to Lee in that rare foresight for which this great commander was pre-eminent. No general has ever surpassed Lee in this respect; his ability to forecast the movement of his enemy in advance of its actual occurrence was truly remarkable, and gave him a distinct advantage in the preparation for and actual conduct of a campaign.



Another characteristic of Longstreet differentiating him from Lee and Gordon was that he was not inclined to take risks in making battle. Had he always pursued his own views he would rarely have entered a battle unless reasonably sure of a victory. The risk at the battle of Gettysburg, for instance, was no greater than the most careful and skillful general might have taken. Of course, there was a degree of uncertainty in the result of that battle and this risk was doubly emphasized by the possibility that the concert of action should be exact and constant, according to the plan of Lee's great military genius.

Longstreet at all times had his com-

* Reviewed in THE INDEPENDENT December 31st, 1903.

mand under splendid military control, and his discipline was of the best. He also had the utmost respect and confidence of his men and the esteem of the people at large, who generally ranked him next to Lee in ability.

When he returned from the war he was in an impoverished condition. He possessed absolutely no business ability, having had no training along this line. The making of a living therefore presented to him more difficulties than the

GENERAL EVANS GENERAL STEPHEN D. LEE

Second and First in Command of the Confederate Forces

plan for and execution of a battle. There may have been but one field open to him. He had friends who could help him into a position where he could serve his section and his country, according to his views at that time, and no stern criticism need ruthlessly to condemn him for yielding to the spirit of kindness which sought to help him.

General Grant, being a warm personal friend and distantly related to him, offered and urged that he accept office under the new order and conditions existing soon after the surrender. He did so, much to the dissatisfaction of the Southern people, who felt that he was thus turning away from them at a critical period. But it can be considered that General Longstreet believed he could better serve his people in that way than in any other. Certainly there is no ground for any suspicion that when he accepted the office from General Grant there was in his or Grant's mind any idea that he could be used as a political tool.

Longstreet was severely criticised by some who imagined that he was to be made use of to draw at least a part of the army into the support of the Republican Party. But looking back to that period there is no ground for this suspicion. In fact, it does not appear that his being a Republican was ever used by himself to induce others to join the ranks of the party.

It was unfortunate for him that he disassociated himself from the Confederate soldiers with whom he fought. It was their great regret that he never joined them in their reunions. This might have been due to the fact that he feared he would not have been welcome among them, but in this he was vastly mistaken. It is thought by many that

his apparent lack of interest in Confederate affairs and comradeship was the reason why his funeral demonstrations were not equal to those of General Gordon. The great bodies of the young people of the South had never come in contact with him. They knew little of him personally, and they had grown to regard him as a great military leader, whose attachment to the cause for which he had fought with their fathers had grown cold.

But Gordon and Longstreet will each have an exalted place in the history of the Confederate war, and their memories will be cherished as two good types of the American soldier.

ATLANTA, GA.

The Short Days—An Idyl

BY E. P. POWELL

AUTHOR OF "OUR HEREDITY FROM GOD," "WINDBREAKS, HEDGES AND SHELTERS," ETC.

THERE is always something old-fashioned about winter. We cannot change it; but summer is utterly different from the summer of our grandfathers. Winter is methodical, conventional, always white-robed, but dark-dayed and stingy of sunlight. It has a curious way of closing in upon us by degrees. The days have been dropping off minutes and half minutes, for a good while before we notice it. But when we have to light a lamp for our six-o'clock supper the sage remark is made, How short the days are! In the morning we lie abed later, and miss the exhilaration of bird song.

October 1st.—We have already begun to get ready for winter. It takes one-third of the year to get into the leafless days, and to get well out of them again. The orioles left us about the first of September. Yesterday the catbirds went away. My dearest friend among them spent a day about my window, crooning a good-by. God bless the dear bird, and bring him safely back again in the spring! Dear me! but what lots of fine things we have to get along without. There are no birds left now except the seed-eaters. If we were not so busy gathering crops it would be pitifully lonesome. How much we do owe to these feathered cousins of ours. It is lucky that we have so much to do, picking apples, digging potatoes, husking corn, bringing in the huge loads of pumpkins. The wagons rattle through the valley after fresh loads. Is there anything in the world more delicious than an apple orchard in October? The Scarlet Spitzenburgs remind us of childhood, but the Northern Spies and Baldwins are newcomers—full of competitive juices. The old-fashioned orchard was made up mostly of seedlings, high-limbed, and grafted at the top; and we boys liked to climb forty feet to sit up among the crimson apples. Now apple trees are low-limbed, and bend to the grass with their yellow and scarlet globes. The sun sets before six o'clock, and we can hardly get in a good day's work. At this rate we shall not have everything housed before the snow flakes begin to be shaken out of the sky. A potato bin in the country cellar is a jolly thing to look at. It will never do to run the risk of a freeze before the bin is filled.

November 1st.—There is "lots of work" yet to do; and the sun sets a little after five. I have still a few string beans every day fresh from the garden. It is a trick that I have of breaking down a few poles of late sorts, and covering them with armfuls of hay on the cold days. But beside these everything is frozen and brown. The apple orchards are pretty well cleaned up; the farmers are busy picking up the cider apples and rushing them to the mill. Yet it is true, as some one has said, that if God put off freezing weather until July, some men would not get their apples picked. Others always sit down in snow and slop

to husk their corn. A few rose buds on Hermosa, Meteor, or Coquette de Alps take advantage of warm days and throw open very welcome flowers. I find myself turning, however, to the rich, warm red of the barberry bushes and the high bush cranberries. These defy winter and carry summer color through the shortest of the short days. The grape vines are trimmed as fast as possible, and laid down from their trellises. The berry canes are cut and burned. A good comfortable compost is spread over the strawberries—not to prevent their freezing, but their thawing during the winter. We also bind coats of straw about a few half hardy shrubs, and begin to hill up the roses. Snipping frosts have blackened the dahlias, and sprawled the nasturtiums flat on the ground. We have dug a few lilac bushes, and spireas, and lemon lilies, to box for winter blossoming in the window.

Look over the lawns and gardens and you will see what a fine thing it is that winter does not close in on us suddenly. You can see right through the magnolias and elms and maples; and you begin to marvel at the beauty of the naked trees. Just to the right stands a big persimmon tree, without one single leaf, but hanging all over with rich golden balls of fruit—the only fruit that the frost cannot damage. The eye drops upon one field after another, in the distance, out of which we have taken harvests, that we know are stored away to make us safe from hunger. Thank God! let the winter come, let the snows shroud the earth, the Father rules! The Thanksgiving mood begins to come upon us. It is just as natural as the mood of spring and that of summer. It needs no proclamation of the President; we could not help giving thanks if we would. The little mother takes charge of the world; she will teach us how to put our gratitude into rhythm. Everything hangs on a decent kitchen—I mean, woman's laboratory. Thanksgiving marks the real close of the growing and the harvesting year. We have got through with our work, and hung up our tools. The coal is in the bins; the cellars are banked up; the double windows are in place. Nature turns a screw to suggest to us that we had better be ready. The sun sets before five o'clock; it rises after seven. We eat two of our meals by lamplight. The evenings grow long and social. Plays are developed, and with music become the center of life.

December 1st.—We are eating the last of the grapes—except a few varieties that are in storage for another month. Spitzenburg puddings and pumpkin pies are in order. A few of the Put-off family are dragging in corn stalks through the snow. This is a curious family, but it is a big one. When the storm begins they scramble; but in good weather they never look before them. Their pumpkins are always frosted; and their corn is always moldy. They wait for the January thaw to dig their potatoes. The premonitory signs of Christmas begin about this time. We long ago made up our minds, and we said it very emphatically, not to get up any fuss this year. We positively would not spend so much money on Christmas presents. But the symptoms are here again and we cannot help it. As we fell into the Thanksgiving mood, so the Christmas tide picks us up. Every maid is stitching for dear life, and we begin to make up the list of those that really must not be forgotten. What would these short days be good for, or how could we stand them, but for these blessed intrusions of generous sentiment. Our hearts melt in spite of us, and our purses loosen their strings. It surely is a sort of divine disease of the season—a panic of good will. We begin to like picking out presents—only with an occasional gasp, and a congratulatory hug that Christmas doesn't come but once a year. The presents accumulate. The list grows. It is more blessed to give than to receive. You have not a thought left about getting, only of giving. Bless the Lord for Christmas! It is the June of the soul's summer. Come now! clear the table of gifts, or we shall never have our breakfast. I 'phoned across the valley to Father Dan, to know what he was to have for dinner. "Chicken pie, of course," he sung along the wires, "and you shall have the wish bone." Dear old Father Dan, he keeps the spirit of the olden days into the new.

January 1st.—There is something curious about these little bits of days that

make up the middle of the winter. It is hardly worth while getting out of bed at all—just for eight hours—no morning, and no evening; only a middle to the day. Why have we folk not yet learned to hibernate? Nature works out some of her best problems with the animals—the other animals I mean. Not to say too much about it, if a man lies abed twelve or thirteen hours, and eats two hours more, then dozes and reads two more, what has he left? I sincerely believe it would be a good thing for us if we could take one solid sleep from Christmas to Easter. Nor am I quite sure that in some of the evolutions of the future a race will not come about that can put itself away for a month or two at a time, instead of being stupid and half alive. It may be true that man has been lifted above the beast by increased restlessness, foresight as well as hindsight—that is, by eternal watchfulness. If so, nerves have certainly run ahead of muscle; and by and by they will wear out the muscle altogether. Every animal has a better system of rest than man. It sleeps to recuperate; it lies down after eating and working. Man only crowds restlessly on. Think of a collie sitting upright, by the hour, letting his legs grow into hands! How stupid, to be sure! He will soon be compelled to read a newspaper, or to write out his emotions with a pen. He will begin to be metaphysical; demonstrating the advantage of losing two good legs, and gettings two hands that he does not know what to do with. At last, driven by the rage of restlessness, he dreams out a theology of eternal rest. Poor collie! Why not lie down occasionally and rest now?

I consult the almanac! Already, in December, we gain five minutes; by the end of January we shall have gained one full hour, and that will be duplicated in February. What a delicious thing it is to have this power of anticipation. We are thinking of the first blue bird. A stray robin or two have been about all winter, hiding in the evergreens, and picking up a living, nobody knows how. Nuthatches, chicadees, woodpeckers, grosbeaks, cedar birds and others, have been around the house through all these short days, sometimes twenty at a time; picking the bits of suet and lean meat that we keep everywhere hanging about the vines and trees for them, or chopped up in boxes. They vary the food by hunting all over our trees for the eggs of noxious insects. Being honest country folk, we sit down to the supper table at six o'clock, and rub our hands with a "Well! Well! we shall very soon be able to eat once more by daylight." But the next day is lowery, and for twenty-four hours we see no sun. It is dark at five o'clock. "Put away the books and the needles," we hear the mother say, "for the eyes must not be used by twilight," and really these days there is little but twilight. The cold waves have rolled over us in rapid succession. We have had hardly one day for a month that we could stand still out in the sunshine, to thaw out the blood. Boys and girls have coasted the hillsides until even that boisterous fun is no longer satisfactory. In the kitchen they are frying doughnuts. By the way, there is no room in any house, ancient or modern, that is quite equal to the kitchen, in winter. There we can parch the corn, and there we can crack the butternuts, and there we can make the molasses candy. In fact, it is in the kitchen that one can be jolly during these short days. The kitchen, rightly looked upon, is the most wonderful place in the world. It is a chemical laboratory, where woman creates and synthesizes, instead of merely analyzing as in other laboratories. It is not a bad room for playing checkers and dominoes. The heat of the kitchen stove has something more cheerful in it than that which comes through registers.

February 1st.—Another longing is on us—an undefinable, but irresistible, craving for things that are green. We want the world back again, delivered of its winter bondage. All we can do is to start for the grocery to buy spinach, string beans, succotash and asparagus. It is my private opinion that there is no vegetable in the world quite equal to asparagus—green, juicy, real genuine asparagus, on toast. The chiefest achievement of modern life is the canning of spring and summer, to be enjoyed when we have this longing come upon us in the white short days. Yet, after all, we try one thing and then another, without quite getting satisfaction. They only ease

over the days, until we can get out to hunt the first dandelions, under the hedges, and the water cresses by the springs.

A couple of warm days have melted a part of the snow. There is a patch of bare brown ground behind one of the hedges, where I can stand on the dear old earth and rub my feet on last year's sod. It is dry and it is brown, but I know the heart is green. And I know, too, that under the soil, under the snow, the hyacinth bulbs have felt something that I have felt, and are stirring—and swelling, and pushing, and getting ready. Perhaps it is the same feeling that sends me around to the grocer. One month yet before the blue birds! The sun rises at seven, and it sets at half-past five. We are evidently crawling out of the hollow log. The farmer looks over his seed, and he thinks that he must try one or more of the new potatoes; and he tells the boys that, if they will plant a melon patch in the middle of the corn field, the rogues will probably not find it. What is the origin of that code of morals that allows boys—and men—to steal melons and grapes, but not potatoes and peas? It is a psychological question worth some attention.

The getting ready process goes on more rapidly. As February wanes the days wax. All one night the South wind roars, and there comes in the morning a deluge. The sun shines with July glory, and makes a complete housecleaning all over the hillsides. The water runs in rivulets, in brooks, in torrents. The great creek in the valley swells its banks and floods the gardens and the cellars. The hens cackle; the dogs bark; the bees come out of their hives with inquisitive flights; the dandelions begin to grow small leaves; the woodpeckers tap the hollow apple trees, and the farmers tap the maple groves; a few butterflies flit to taste the sweet chips, and the farm boys haul out the plows and oil them ready to turn the glebe. Over the hills one blue morning a blue bird cuts the air with a whistle. They are coming! They are on the way! Winter is dead! Long live the spring! The short days are over with. The sun will soon rise at four o'clock, and the cows will be turned out to pasture.

CLINTON, N. Y.

A Valentine

BY BENJAMIN B. WARFIELD

HE.

DAN CUPID went to shoot one day,—
He flushed three hearts upon the way.
One was so hard, his arrow broke
At every stroke;
One was so soft, no barbs so bold
Could in it hold;
And one was fair, and sweet, and sound,—
He quickly brought it to the ground.
Now, tell me truly, maiden mine,
Which heart was thine,
My Valentine?

SHE.

A sportsman's tale! None of the three
He tells of was the heart in me,—
The soft, the hard, nor yet the sound
He boasts he brought to ground.
At others yet,
(Did he forget?)
He leveled his artillery;
And shot and shot again,
And ever shot in vain,—
He missed them clear, you see!
Of these was mine,
My gallant fine,
But not at all my Valentine!

PRINCETON, N. J.

Music, Art and Drama

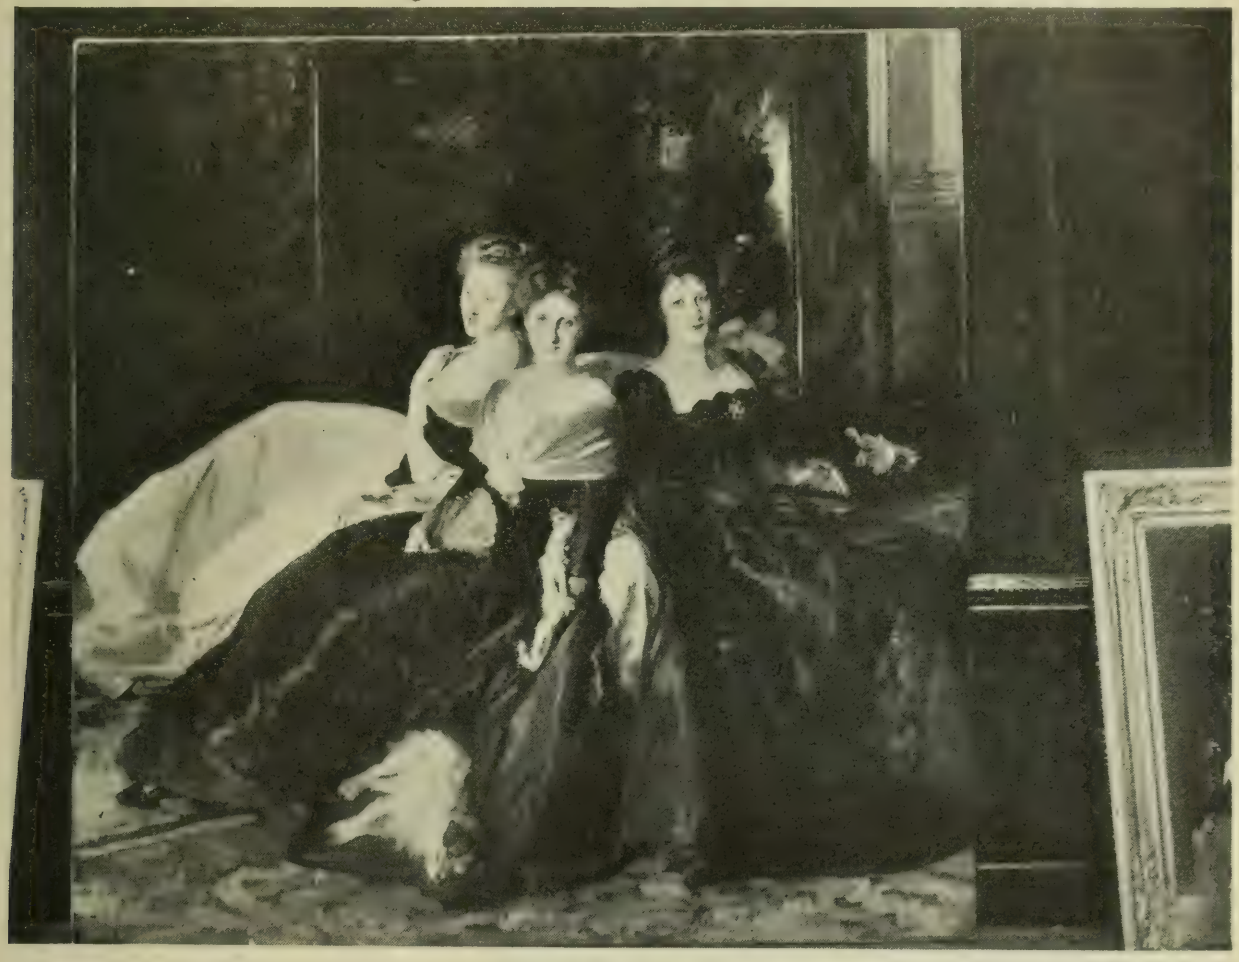
The Drama

THE operas produced at the Metropolitan Opera House this winter, as we said last month, continue to be altogether the most notable dramatic productions in the city. The operas selected for presentation have been interesting and representative of the most various schools of music. The management has shown a catholicity of taste and a freedom from addiction to any particular school or composer which are creditable to it in the highest degree. Such specimens of the melodious and florid Italian school as "L'Elisir d'Amore" and "The Magic Flute" have been presented with the same admirable care and perfection as the representatives of the more serious modern school, such as "Tristan and Isolde," "Tannhäuser" and "Aïda," and upon the whole no lover of operatic music can complain that the opera this winter in New York has not been produced in a manner uniformly complete and noble. Mr. Conried's management has never been surpassed in this city.

The most admirable dramatic entertainments in the past month have been the plays produced by Miss Ada Rehan. Miss Rehan has been, for many years, easily the greatest actress of comedy on the American stage; and, indeed, with perhaps the exception of Miss Ellen Terry, on any English speaking stage. She has appeared this winter in New York in three of the best comedies in the English language, Shakespeare's "Taming of the Shrew" and "The Merchant of Venice," and Sheridan's "School for Scandal." Her acting in all of these plays has long been recognized as of the very highest artistic rank. She has never acted with more finished art and charm than this winter, and her matchless voice and the touch of drollery which she gives to a humorous sentence are as witching as ever. She has been well supported by Mr. Otis Skinner and a competent company. She appeared at the Lyric Theater, one of the most comfortable and attractive of the new theaters of the city, where this season great plays have been admirably produced. It is much to have had a chance again to hear the stately and beautiful poetry of Shakespeare, or the brilliant wit of Sheridan, instead of the dreary and vapid style of prose in which so many modern plays are written.

The prettiest modern play, of the innocent heroine style, with the scene laid in our own times, which has been produced in New York recently, is "Merely Mary Ann," in which Miss Eleanor Robson takes the leading part. The play is neatly written, and has throughout an atmosphere of innocence and sweetness which is very charming. Miss Robson's acting in it is of very great merit and of still greater promise. She ought to reach a very high rank in her profession. She is well supported by Edwin Arden and the other members of the company, and

Miss Ada Rehan as Portia in "The Merchant of Venice," at the Lyric Theatre



the play is one which can be recommended most cordially.

"Little Mary," by Barrie, produced at the Empire Theater, has much of the quaint and fantastic element so noticeable in all of Barrie's books and plays, and has a good deal in it that is amusing and enjoyable, but the play is so defective in any dramatic continuity or movement that it is, upon the whole, somewhat disappointing, altho amusing and interesting by reason of its whimsicality. It is very well acted, the entire company working well together.

"Ranson's Folly," by Richard Harding Davis, is bright and clever. The scene is laid in a Western army post, and the play turns on the prank of a young officer, who pretends to hold up a stage, on a wager, on the same night when an actual robbery occurs, and who is consequently charged with robbery and murder. The subject is one which most dramatists would have treated coarsely, with plenty of shooting and horrors in sight of the audience. Mr. Davis is too clever a writer to commit such an error, and the style of the play as written is unusually attractive and interesting throughout, and the acting is extremely good. This is a genuine American play, giving a graphic picture of army life on the alkali plains, and is, upon the whole, the best play of that kind that has been produced in recent years in New York.

"The Secret of Polichinelle" is said to have had a great success in Europe, and it has a certain interest, but it is thin and talky, and, like most French attempts to be good, it is so very, very good. It reminds one of those collections of *contes pour les jeunes filles,* to be read by the Mademoiselles in the class at boarding school. It is well played; the parts of both "Monsieur" and "Madame Jouvenel" are capitally done, particularly the part of "Madame Jouvenel," by Mrs. Harriet Otis Dellenbaugh. The old lady as represented by her is a dear.

To the lovers of the serious drama, those who believe that the stage can give lessons in life instead of furnishing mere amusement and distraction, the presentation of Ibsen's "A Doll's House," at the

"The Misses Hunter," by John S. Sargent

Manhattan Theater, was of importance, for it showed that a deeper impression can be made by reality and earnestness than by ranting and red lights. As Wagner had to originate a new style of singing, so Ibsen has to create his own actors, for those who have been accustomed to ordinary plays find it hard to rid themselves of the tricks and conventions which have made the word "theatrical" an approbious epithet. Miss France Hamilton gave a new "Nora," ineffective and sometimes inaudible in the first act, and the Ibsenites, who have very fixed ideas of the part, shook their heads, but as she developed her conception of the character and showed her strength, she won more and more of her audience to a belief in her interpretation. Mr. Albert Bruning as "Dr. Rank" did splendid work, and Mrs. Viola Fortescue made a real person out of "Mrs. Linden," and so discredited the critics, who have always said the *rôle* was a mere dummy.

In the dramatization of a book there is an inevitable coarsening and loss of some of the finest qualities, and in the staging of "The Virginian" what is dramatic in Owen Wister's novel becomes melodramatic, and what is realistic becomes conventional. But it makes a good play, nevertheless. Mr. Dustin Farnum was a satisfactory "Virginian," when he did not forget his dialect, but nobody would have suspected that "Molly Wood" was a Yankee schoolma'am if she had not said she was. Medicine Bow without a tin can and a Wyoming ranch house with climbing roses and sweet corn are amusingly inappropriate. Mr. Wister has introduced a musical "Trampas-motif," which is very effective, and we wish he would try his hand at an opera.

In the performance of "Raffles, Amateur Cracksman," at the Princess Theater, considerable liberty has been taken with the text of the book as originally written by Hornung, but the play is well acted, exciting and of considerable power. Kyrle Bellew, as "A. J. Raffles," the "gentleman" burglar, is very realistic, but Stanton Elliott, as "Bunny," by no means carries out the ideal suggested in the book. E. M. Holland, as "Captain Bedford," is very satisfactory. "Raffles" is decidedly worth seeing despite a mock-heroic curtain-raiser.

Memories, by J. W. Alexander

Philadelphia's Annual Art Event

The directors of the Pennsylvania Academy of the Fine Arts save Philadelphians much vain wandering in search of good art by gathering together annually in one place most of the best things of recent American production. Non-Philadelphians would certainly find it worth while to make a trip to see the nine hundred interesting works shown in the seventy-third exhibition of this society. A few of the most remarkable are here reproduced.

Among the portraits are satisfactory groups of pictures by two men who are entirely opposed to each other in temperament. If Sargent is Court Painter to Fashion of the time, Wilton Lockwood is certainly the painter of the thinking man in the aspects of him that

clothes do not make. Chief among the seven Sargents is the large canvas of the "Misses Hunter," as unmistakably English in every way as the "Mrs. Widener," seen here at the Portrait Show, is American, and painted with a quieter energy more suitable to the spirit of their types. This picture holds together in color better than the "Three Graces" of the Royal Academy of 1900, tho in neither group may we look for Sargent's greatest success.

The most significant of Mr. Lockwood's four portraits is that of Grover Cleveland, a work certain to be judged partly according to the manner of approach to the subject. Here we have nothing of the personality with which Mr. Cleveland's warm haters deal humorously. Zorn painted that side. Lockwood gives us the Cleveland in whom a large number of his fellow citizens have unceasingly believed. It is a portrait of the reserved man of intellectually attained convictions. Lockwood's method seems very simple. He does so little with "motives;" his technic is a convention of his own invention, and he varies it little, but of all our portrait painters he is the one who gets farthest from paintiness and has most of the character-creating power. His mannerisms, in the thin impasto and the personal color convention prevent many from appreciating his remarkable insight.

Cecilia Beaux has never done a better thing than the portrait of a child in yellow gown and sandals. It is the most beautiful child portrait since the "Beatrice Goelet," of Sargent. There are four typical Whistlers; two of them of more elementally rich color than he usually used. Two of Dewing's delicate studies of women are shown. He, too, has his own conventions and uses them exquisitely. Among Mr. Chase's five canvases it is difficult to consider anything except the astonishingly masterly still-life of fish, than which it is hard to imagine a better piece of painting.

Of figure pictures other than portraits there are many good ones. There is Mary Cassatt's "Caress." One might do with this strong painter's work as Bernard Shaw did with his plays, divide them into the "Pleasant" and the "Unpleasant." "The Caress" belongs to the pleasant set. The luxuriously lolling child being kissed by the nice, affectionate little girl, and the disinterested young woman in gray-green velvet, are managed with utmost technical skill. But, as usual, when John W. Alexander's work in figure composition is present it exceeds the others in this genre in interest. His "Memories", is one of the most perfectly successful things in line and color and tone that he has painted. It is musical in its special appeal to sense. He is a painter who presents rather than represents, and his mode of doing so leaves aside ordinary painter's methods. Four landscapes by Ernest Lawson recall pleasurably the poetic work of the late J. H. Twachtman, and are the most sensitively felt of the direct renderings of nature shown. Redfield's "Surf" is a marine unequaled by any other in the exhibition, even remembering the pres-

The Caress, by Mary Cassatt

ence of Winslow Homer's "Early Morning, Coast of Maine." Ranger's "Sheep Pasture" is one of the best landscapes. Ben Foster's "Night-fall" and "Late Afternoon," and Ochtman's "Early Evening" are sincere and tender renderings of these most mysterious hours.

The sculptures shown include nearly all that were at the Sculpture Society exhibition here, and others. Among them the impression gained at the New York exhibition of the value of the work of Gutzon Borglum deepens. His "Portrait Mask" is as certain as Sargent's "Widener," and his "Nero" is as inventive as the other is realistic.

Arts of the East

We now have yearly sales in New York of all the various works peculiar to the Japanese and Chinese genius, and while the development of our taste for these things is remarkable, it is even more remarkable that any real connoisseurship has not been attained. If the taste trained by our Western ideals would even trust itself a little more, we might get at the actual beauties of the Eastern arts more simply and naturally. The Japanese themselves are amused by most European and American judgments of their arts, yet in presenting their collections to the American people they too often seem to feel obliged to conform to some of our more foolish requirements in the things we buy, our absurd worship of the non-essentials, as in the matter of dates, for instance. Mr. Matsuki furnishes his catalog for a New York sale with dates far more glibly than would a Japanese expert at home. But at both the Matsuki and Yamanaka sales in January there were things which were beautiful, whether they were done in the years to which they were assigned or not; carvings in jade and stone and wood, lacquers and inlays—all of what might be called the every-day art of old Japan, judging from the quantity of it that seemed marvelously well done even to an observer not a specialist. At the Matsuki sale were beautiful specimens of Chinese and Japanese pewter of familiar shapes, but unique in treatment and material. More difficult to classify in any ordinary ways of judging were the productions based upon the lines and contours given in the natural wearing and rotting away of wood and the weathering of its color by rain and sea, helped out by just the right amount of carving or added color to suggest a scene or a figure.

Portrait, by Cecilia Beaux

An Attempt to Regenerate the Drama

It is all very well to say that the drama of to-day is vitiated, that it mirrors life from a debased and untrue standpoint. One may rage against all the ills and evils, from the ticket speculator and exorbitant prices to immorality. But the man who by actual example can show how needlessly pernicious these evils are, who, by producing the worthy play worthily, can point out what flippant and degraded plays we have tolerated, that man will do more than all the writers who ever protested toward the regeneration of the drama and the establishment of an enlightened theater. And it is in this light that Mr. Sydney Rosenfeld's project, The Century Players, is to be viewed.

Mr. Rosenfeld is a playwright of repute, and has had managerial training.

Few better know the commercialism of the present American stage; but this knowledge has made him realize that there is a place for a higher and better product—for the artistic and literary entertainment which an enlighted man can enjoy without insult to his intellect. As a result he has formed a stock company known as The Century Players. The first production, on the 22d of this month, at the Savoy Theater, will be Shakespeare's "Much Ado About Nothing." This will be followed by an American play, after which will come a revival of Lester Wallack's famous success, "Ours," to be followed in turn by another American comedy. A production of "Othello," cast to the full strength of the company, is announced. In addition to these productions there is to be a series of literary matinees upon which occasions there will be seen dramas by Ibsen, Shaw, Maeterlinck, Sudermann, etc.

In The Century Players there will be no "star," and no play shall run over four weeks. The aim is to encourage American writers, the hope being to induce well-known literary men as well as those unknown to turn their talents toward the stage. In regard to the smaller, but none the less aggravating abuses, Mr. Rosenfeld proposes to correct the extortionate prices now paid for seats. Good seats may be had for a dollar, with a few choice ones at a dollar and a half. The ticket speculator will be done away with once and for all and the practice of sending the best seats to the hotels will be discontinued. Even in the matter of billboards and show window advertising—a thing distasteful to many—care has been taken. All announcements will be made through the newspaper column.

This experiment is one which will be watched by the whole country. If it succeeds it will unquestionably be imitated all over the land. If it fails, it will make any subsequent attempts at reforming the American stage very disheartening. We hope that success will crown Mr. Rosenfeld's efforts.

The Orchestral Problem

On January 29th the enthusiasm of New York over its rejuvenated Philharmonic Society suffered relapse. For on that occasion the orchestra under Victor Herbert sank far back toward its familiar and deplorable form of previous seasons. To blame Mr. Herbert for this disappointment is a proceeding more obvious than just. True, he is not so potent a conductor as his celebrated predecessors in the series: Colonne, Kogel or Wood. But in this case one must seek beyond the conductor's platform for the causes of the discrepancy. In a word, the New York musician has been spoiled by a vicious orchestral system; and the admirable work of the Philharmonic this season has been done under an abnormal stimulus, which is bound to lose its effectiveness with its novelty.

Why have three cities in America better orchestras than the metropolis? Simply because those ochestras have been put upon a sound and rational basis. In Boston, Chicago and Pittsburg the players are under contract to give all their time to the rehearsals and concerts of the organization during the season. They rehearse daily and sometimes twice a day. The labor unions have but little power over these orchestras. In Boston the players are, in fact, non-union men. The control of the conductors is absolute.

In New York the players, however, are paid at the union rate for each concert and rehearsal, all except the 60 members of the Philharmonic Society, who share the proceeds of their series. Their time is their own. Consequently the symphony concerts are distinctly a side issue. Most of the musicians have theater positions, which they significantly entitle their "business," and it is no uncommon thing for a man to rush from the symphony to play at an all-night dance or to parade the streets in a brass band. The evil effect of such side activities upon tone and technique—especially of the wind choirs—may hardly be exaggerated.

Such a state of affairs has changed the rehearsal from a daily necessity into a luxury and vitiated the authority of the conductor, while in the Philharmonic a co-operative system has arisen which places in the hands of the player the balance of authority—and gives him an easy sense of equality with his leader.

Royce, our foremost philosopher, states that the Declaration of Independence in declaring all men naturally equal "is

founded upon speculative principles that have been rendered meaningless by the modern doctrine of evolution." Whatever effect this doctrine of equality may have had elsewhere, its effect on the orchestral music of New York has been demoralizing. The baton of the conductor must be a rod of iron. When it loses its potency the orchestra is doomed. The player, once innoculated with the doctrine of "equality," adopts a Cassian attitude toward his musical Cæsar. Authority galls him; he grows insubordinate and exchanges the spirit of an art union for that of a labor union. Now the pseudo musician in New York outnumbers the artist by ten to one. He controls the action of the Musical Union; and, accordingly, we have the concert hall fiddler and the band man dictating to our orchestral conductors and hampering them at every turn. Such a system tends to evolve the conscientious musician into the impudent mechanic, playing with one eye on the clock and quite ready to "quit work" in the middle of a note on the stroke of twelve.

The Philharmonic Society announces that its present plan of inviting different celebrated conductors for its concerts will be continued another year. New York has congratulated itself on the apparent miracle accomplished by this expedient.

But there will be little ground for optimism should it elect another permanent conductor under the old system. At the hands of his old fellow musicians Victor Herbert has met with the contempt accorded to the proverbial native prophet. And familiarity will quickly breed a similar fate for any conductor who assumes charge of an orchestra on a financial basis no sounder than any of which New York boasts. A fair example of the work of the Philharmonic under ordinary conditions is exhibited by the Wetzler Orchestra. The personelle is practically the same; it is a miniature "Philharmonic." Its performance is to be deplored for the poor attack, for the lack of spirit, for the raucousness of the brass; for the unreliability and falsity of the wood-wind and the coarse, thick tone of the strings. Wetzler secures results as much the better as his talent exceeds that of Walter Damrosch. The cause of his failure lies in the system and its effect on the attitude and proficiency of the players under him. The situation may best be comprehended by a visit to one of his rehearsals. There this serious and able musician commands little respect or authority, and the atmosphere is as earnestly artistic as that of a sophomore eating club at college.

The other orchestras of New York tell the same tale, only in rougher language.

There is none fit for a moment to rank with the organizations of Boston, Chicago or Pittsburg.

But that the New York musician is not hopelessly demoralized has been shown by the recent brilliant performances under the novel and evanescent stimulus of foreign batons.

New York needs fewer orchestras and more rehearsals. And a few generous guarantors, by demolishing the co-operative system, by placing each player under contract and arming some great conductor with absolute authority, might in a short time dignify the musical metropolis of the world with a fitting orchestra.

For Thee

BY MARY A. MASON

A LARK should sing for thee at dawn,
If I could have my way;
A nightingale should sing at eve,
And I would sing all day.

Thou shouldst not see one sparrow fall,
Nor know what men call pain,
Nor dream the heart could those less white
Than angels entertain.

Thy days should all be sunshine long,
Thy nights have no alarms,—
The darkness only send thee home
To nestle in my arms.

When on glad wings thou takest flight
To that more radiant sphere,
I would be here to say farewell
And there to greet thee, dear.

BINGHAMTON, N. Y.

Literature

A Forest Hearth*

It is easier to dramatize life in the city than in the country. When the scenes of a novel are laid in a great city, the domestic center is somewhere between a drawing room or a tenement house, the landscape varies little from pavements to roof tops, and the movement of every character is regulated by the infantry march of the crowd. Within these narrow limits demonstrations of human nature are more or less artificial, easily learned and easily written out. But every man has a sort of originality in his natural element. There is a freedom in the fields and skies that enlarges his definition and makes him, indeed, a creature of the imagination. And so when an author chooses the scenes of his story from Nature herself, he must prove himself a real artist if he succeeds in his undertaking. The life of the man must correspond in some occult sense with the genius of things about him, as the colors of a picture blend in the background. He must be kin to the wilderness. There must be a tawny likeness between him and the very creatures; above all, there must be a weather in his woods like the winter and spring time of the earth; for he is like a spirit made manifest by everything he beholds. The forest becomes as much an expression of his mind as are the great buildings the expression of the city man's mind. He is the medium through which the whole of Nature passes up to God in praise. Now of the many who attempt this harmony between man life and earth life, few have the Antæan faculty sufficiently developed to carry out the idea. But Mr. Major is an exception. This is another delightful story from his Blue River settlement in the Indiana wilderness, remarkable for "settlement humor," and for the security with which the green-hearted wood holds the situation within its fragrant boundaries. The scene shifts to a commercial center now and then, but this is for the purely mechanical purpose of creating dramatic effects. The man and the maid belong as really to the Forest Hearth as the oaks to the wilderness, or the blue bells to the water's edge.

The heroine of the story is an especially attractive character. When an author is capable of interpreting one extreme of human nature, he is generally able to present the other, and we have not had time to forget that delightful termagant of Elizabethan femininity, "Dorothy Vernon of Haddon Hall," before he introduces "'Rita Boys," her contrast in time, temperament and character. All good women, of course, have the same elements of character, but the difference is in the manifestation. Thus the red-headed Dorothy, born and bred in an evil day for women, showed a fierce chastity, an immodest virtue, while this pioneer maid in her woodland convent has the rarer charm of innocence added to primitive purity, a girl easily won and easily kissed since she was without suspicion of evil, and lacking in every sort of courage except the desperation which love sometimes supplies to the timid. With her goodness was not a principle, but it was the only form of life known to her. In these days when the heroine of a story is generally represented as keeping her virtue by the skin of her teeth, this lily of the wilderness may seem too unimaginatively perfect to prove interesting, but the character is so ingeniously portrayed, the heart so sweetly betrayed that in a different way she is quite as attractive as the gallant English hussy, Dorothy Vernon.

Yet, when all has been said, it must be acknowledged that the book lacks the literary flavor of Mr. Major's earlier novels. It is difficult to tell where the fault lies, but the appreciative reader will detect a flaw in the form of expression often used which mars the symmetry of the work.

LANDSCAPE WITH A RUINED TOWER.

About 1648 (B. 223).
From "Rembrandt, His Life, His Work, and His Time"

A Study of Rembrandt's Life and Work

THE splendidly illustrated work* on Rembrandt by Emile Michel, member of the Institute of France and Conservator of the Louvre, appears in a new edition at the right moment. M. Michel has been proving his authority as an art critic in his lectures here this winter under the auspices of the Alliance Française, and interest in his work will be general.

His study of Rembrandt's art covered many years, and to the expression of it in particular he has been peculiarly sensitive. From it, rather than from the meager records of Rembrandt's time, he has constructed the "life of small events and large passions, its glorious masterpieces marking the successive epochs of troubled existence," with the effect of conjuring into existence for us a vivid realization of the man, which is rather, perhaps, a personification of the idea of Rembrandt conceived in the brain of an artist like M. Michel than the historical personage of whose life so few details are known. Necessarily, however, in the case of a genius, his work shows all of him that is best worth knowing, and the great value of this book is in its very interesting and profound studies of Rembrandt's productions.

These studies take up group after group of his works in the order marked out by the dates he nearly always so carefully put upon them, the paintings and etchings of each year being treated as expressions of Rembrandt's thoughts at that time. The first five chapters carry us through the portion of his life up to the time of his final removal from Leyden to Amsterdam—1606 to 1631—and tell something of his methods and his reasons for numerous portraits of himself and his near relatives. Models were scarce in Amsterdam, and the industrious painter could get only those in close sympathy with him to pose for those studies he wished to make in order to understand "the essential features of passions with great obvious effects." Michel gives us less of Rembrandt's methods as a craftsman than as a thinker. Here and there he speaks of the modeling of the impasto in the lights, the thin treatment of shadow, the use of brush handle or knife in the broadly treated parts, or a few words on color; but he says curiously little of the methods of etching, and there is all through the book a confusion of the terms "etching" and "engraving" which leaves us at a loss to know whether Rembrandt used a needle or a graver.

The account of the difficulties of living by art alone in the Amsterdam of that time amusingly contradicts our too ready belief that it is only to-day that art is not the first care of the people. Jan Steen rented and managed breweries; Hobbema was gauger at the docks; de Hoogh was steward under a master who claimed the right to share sums brought by the sale

* REMBRANDT, HIS LIFE, HIS WORK, AND HIS TIME. *By Emile Michel. From the French by Florence Simmonds. Edited by Frederick Wedmore.* New edition. 326 illustrations. New York: Chas. Scribner's Sons. $7.50.

of his pictures. Paintings now famous brought but a few florins, and at a later time Rembrandt etchings sold for sixpence.

Michel admits the occasional "total eclipse of taste" visible in Rembrandt's work, especially in his realistic nudes and his obscure allegories, fortunately few. As an illustrator of any themes aside from Biblical ones he was a failure through inability to make himself the medium of another's thoughts. His

"visions have an inwardness all their own, and the emotions he seeks to inspire lie beyond the regions of convention. His own heart was profoundly touched by them; they haunted his solitary and dreamy mind, filling it so completely that the occasional grotesqueness of his conceptions escaped his notice, and he was hardly aware that his characters lacked nobility and distinction, or that their costumes were often fantastic and inappropriate."

M. Michel's Rembrandt of the years after 1631 is a lovable and affectionate character, adored by the wife Sashia, who died so early, and later by the son and Hendrickje, who succeeded Sashia in Rembrandt's home. He was extravagant in all matters that related to his art, tho living quietly enough to have been able to save from the very considerable income of these, his years of popularity. Tho we are told in the book of his indifference to Italian art and impatience with the imported culture of the time, the list of Italian works and engravings from them in his collection is long. Through an incapacity for managing money, financial difficulties multiplied as the years passed, and Rembrandt, never very popular with the great world of his time, because of his experimental tendencies in the matter of portraits, was superseded by his pupils in the favor of the public; but he continued to paint with the marvelous indefatigability that had been always a marked characteristic of the man. M. Michel gives us magnificent interpretations of these later works—the splendid outpourings of a mind deeply knowing in the tragic side of life.

After this there remains to be discussed only "The Supper at Emmaus," the "Hundred Guilder Print" (1649), and the etchings of Clement de Jonghe and Coppenol; for the master, tho he had many pupils, belongs "to the breed of artists who can have no posterity. His place is with the Michel Angelos, the Shakespeares, the Beethovens."

The book has a carefully prepared list of Rembrandt's works and a bibliography in the Appendix. The translation is excellent, tho there is a curious technicality in the constant use of the word "carnations" to convey descriptions of color in the faces of portraits, and the rather unusual French usage of "in that genre," using the word to mean manner or method.

The Voice of the Scholar

To those who have heard President Jordan speak, the addresses in this volume* will come with the reality and force of his living voice—a voice made impressive by the sense that it comes from a big man, big in body and mind and purposes. To have set such words of wisdom and inspiration ringing in the heads of thousands of young men and women, as he has done, is an educational accomplishment of importance in itself. Most of these addresses have been given at commencements and at inaugurations, such as that of President Wheeler at the University of California, and President Graves (whose first name, by the way, is Frank, not Edward, as here given) at the University at Washington, and some of them have been first published in THE INDEPENDENT.

President Jordan is a hater of shams and a fighter of pedantry. For useless learning, that which effects neither a growth in knowledge nor a growth in the learner, he has no use. His ideal of a university is as broad as it is high.

"Not only for Greek-minded men and Roman-minded men, but for the men of dynamos and sewer trenches, the breeders of sheep and the importers of silk; for the singer of songs and the writer of histories; for all men, of whatever calling, the university has its word of welcome, its touch of power."

As a representative of the newer education, he is tolerant even of those theories of education which are intolerant toward his. No words can be fairer toward the old exclusively classical course than the following, and if the classicists cannot

* THE VOICE OF THE SCHOLAR. *By David Starr Jordan.* San Francisco: Paul Elder & Company.

get much comfort out of them, they have no right to complain:

"There are some men who will find no surer road to culture and effectiveness than the one trodden in Oxford and Cambridge half a century ago. The studies that 'open, invigorate and enrich the mind,' to borrow a phrase of Macaulay, can never be obsolete with those whom they thus affect."

Most of these addresses are answers to certain commonly-heard educational questions; for example, Herbert Spencer's "What knowledge is of most worth?" a question which startled the schoolmen of the day, for they had never thought that any knowledge had any worth whatever. Dr. Jordan's answer to this is, "That which is worth most to me." He would have every man and woman trained according to his individual needs, character and ability. "We do not ask that science be placed in the curriculum, for we would have no curriculum."

In discussing the higher education of the business man, he answers the practical question: "Would you advise a young man with $5,000 capital, intending to become a business man, to spend that sum first on a college education?" To this his very sensible reply is, "Certainly not. Let him work in vacation, and use only the interest of $5,000, and he will have both his education and his principal when he gets through."

On the question of co-education, he speaks from his own experience, as follows:

"Its effectiveness has long since passed beyond question among those familiar with its operations. Other things being equal, the young men are more earnest, better in manners and morals, and in all ways more civilized than under monastic conditions. The women do more work in a more natural way, with better perspective and with saner incentives than when isolated from the influence of the society of men. It turns them away from sentimentalism. It is opposed to the more unwholesome forms of hysterical friendship. It gives tone to their religious thoughts and impulses."

His remedy for all the evils of college life is more thoroughness of education and more earnestness of purpose. "The same methods which cure the aristocratic ills of idleness and cynicism are equally effective in the democratic vice of rowdyism." He rejoices that so far "the Harvard man who keeps a groom for his horses, a groom for himself, and a groom for each of his studies, has few imitators in the West."

The province of a university is to cultivate wisdom, virtue and religion. All these he defines, not as metaphysical abstractions, but dynamically. Like sound, heat and light, they are to his scientific mind "modes of motion." "Wisdom is knowing what to do next. Virtue is doing it, and religion is the heart-impulse that finds reason for wisdom and virtue in harmony with the first cause at the heart of things."

The Latest in Civil War History

A "TRUE" history of the Civil War should, above all things, be truthful. It should, moreover, reveal a close acquaintance by its author with the official records of that great conflict, a clear understanding and a sound judgment of men and events. We are sorry to say that none of these things is conspicuously shown in Dr. Lee's volume.* His inaccuracies are painful, both as to degree and number, and his judgments are often puerile. General Boynton, whose work on the minutiæ of the Rebellion is always painstaking and exact, pointed out in a letter to the *Times* of December 26th some of the grosser mistakes in this history. The list could be greatly extended. The account of the Battle of Shiloh (274-276) is written in apparent disregard of any testimony except that of Beauregard and Buell, and gives a most erroneous view of that engagement. There are two accounts of the Trent affair (179 and 260) and neither gives a correct statement of Seward's contention, of the basis of settlement or of the results of the affair. The statements of losses in the various battles are in most cases given in utter disregard of the careful computations made by the editors of the Century Company's *Battles and Leaders of the Civil War* and the editors of the *War Records*. Many of the descriptions of battles are taken from accounts of English correspondents or under-officers of the Con-

* THE TRUE HISTORY OF THE CIVIL WAR. *By Guy Carleton Lee.* Philadelphia: J. B. Lippincott Company. $2.00 net.

federacy, with no revision in the light of official records or of subsequent discussion. The account, for instance, of Antietam (317) is for the most part the work of some unidentified "Colonel Taylor, of the Confederate Army," and gives a ridiculously false estimate of the comparative strength of the two armies, while it fails to furnish any coherent notion of how the battle was fought. The most egregious errors of statement crowd the whole part of the book relating to the actual conflict.

It is interesting to look upon Dr. Lee's estimate of Northern men. Grant, it appears, had been a complete failure in life (271) at the time the war began. He developed certain qualities of generalship, but he showed "utter lack of feeling in regard to the sacrifice of human life" (374), and his "recklessness of life and blood" (383) was notorious. Lincoln is conceded to have had certain passable qualities, tho R. H. Dana's vicious characterization of him is quoted (328) with evident sympathy, and on page 284 it is gravely set forth that "Lincoln realized the necessity of retaining popular support, and for it he was willing to see his generals officially beheaded." Sherman, it appears, was a liar (364 and 369), a braggart (369), and his troops were vandals (366 and 370), for they "plundered and abused the inhabitants without let or hindrance," evidently with Tecumseh's connivance. Butler was, of course, unspeakable (381-82), and Greeley, tho he held "the highest theories, had an eager desire for the loaves and fishes of politics" (152). This may be thought a curious judgment to pass on one of the least selfish men the world has ever known, but it pales into insignificance beside the judgment passed on Stanton (266):

"Edwin M. Stanton was appointed Secretary of War and proved a striking illustration of the imbecility of the political system which appoints men to positions for which they have no fitness, either by nature or training."

Many of the leading men of the North escape individual characterization at the author's hands. Yet, lest his failure in this respect be construed as an evasion of the stern duty of the "true" historian, he has given an omnibus verdict (319) in which most of the others are included:

"It is our own conviction that a close and intimate understanding of the effect of Northern administrative politics in the conduct of the war reveals a perfidious betrayal of the lives of men and the welfare of the nation."

A "true" history should, of course be non-sectional, and in line with this principle Dr. Lee essays to revise many of the judgments that heretofore have prevailed in the North. There is, for instance, a philosophically complacent account of "Bully" Brooks's assault on Sumner (121-122). There is a plea for Vallandigham (329-331), and a verdict that "there can be no question that the whole proceeding [his arrest and deportation] was entirely illegal." There is the judicial utterance (188) that "the North did not wish war; she seemed to be more afraid of loss of trade than of disunion." The New York draft rioters of 1863 would appear to have been a much misunderstood group of estimable persons. "In spite of their excesses [they] had a real grievance" (332). That little matter of the employment of a brigade of Indians in the Confederate Army at Pea Ridge was not so bad after all, even tho those savages *did* scalp and otherwise mutilate the wounded soldiers of the North; for it appears that they were *"organized and commanded by Albert Pike, a Boston man and a graduate of Harvard"* (289). We presume, furthermore, tho this theory is not advanced, that their employment in the battle was an entire inadvertence on the part of the Southern authorities, and without their knowledge. Lest it may still be supposed in the North that the operations of its armies had any considerable thing to do with the result at Appomattox, it is disclosed (277) that "the Civil War was won by the Union Navy." And, finally, the attitude of the Northern authorities regarding exchange of prisoners is made the subject of a conclusive judgment (368), wherein, it is hardly needful to say, the learned author misses the whole point at issue:

"They chose to allow their own men to languish in prison rather than return soldiers to the thinning ranks of the Confederacy."

There is scarcely a page of this book which cannot be described as "interesting." But the interest, we are sorry to say, can hardly be regarded as wholesome. Were it not for the pretentious-

ness of its title, which may give the book circulation among the uninformed, we should deem it unworthy of notice. We can hardly doubt that the author is sincere and that he believes he has written the thing that is, or rather, was. But for all that, it has not heretofore been our lot to pass upon a historical work so crude and inexact in substance and so vulgar and insulting in manner.

The Oligarchy of Venice

THIS is a very able and scholarly sketch * of certain aspects of the growth and decline of Venice. The author exhibits a comprehensive grasp of a vast amount of material, and has managed to condense it into a little more than two hundred pages without impairing the interest of the subject. This was by no means an easy task and its successful achievement will doubtless stimulate many of his readers to become better acquainted with the history of the Serene Republic.

In Mr. McClellan's description of the functions of the Venetian Government, with the caption, "The Machine," which, by the way, is a remarkably luminous exposition of a most involved and bewildering question, the intelligent reader is likely to see many points of resemblance between the Venetian constitution and that of the organization of which Mr. McClellan is such a distinguished representative. It is, for instance, apparent to the most superficial observer that Tammany Hall is not ruled by the masses who vote its ticket, that its power emanates from a central nucleus, and that its methods are quite as autocratic and aristocratic as were those of the Council of Ten. Thus, as the whole power of the Venetian Grand Council came to be concentrated in half a score of its members, so the whole power of the Tammany organization is concentrated in a hierarchy of half a dozen individuals, and just as the dogeship of Venice was held in commission by the Council of Ten, so the dogeship or mayoralty of New York has often been held in commission by the Tammany hierarchs. It might be objected that the doge of the metropolitan city of the United States has vastly more authority than had the doge of the city on the lagoons, who was shorn of most of the attributes of a ruler. But Mr. McClellan proves that a good deal depended on the personal character of the doge himself, and that many of these Venetian princes exercised a very dominant influence. This will give some encouragement to many who were disappointed in the result of the last election in New York, but who still hope that the Mayor's strong individuality and upright personal character may not be extinguished.

Mr. McClellan demolishes the legends, and in places defends the Republic against the charges of cruelty so often brought against her without sufficient foundation, for the poets, romancers and dramatists of the last two centuries were accustomed to paint her under the most lurid and sinister colors. We cannot, however, agree with him in his estimate of the character of Marino Falier, who was far from being "a great reformer." Ambition was the only motive of the old doge, who sought to attain sovereignty by fomenting popular disaffection.

The Proud Prince. By Justin Huntly McCarthy. New York: R. H. Russell, $1.50.

This ridiculous monster of crime and vanity was the son of Robert the Good of Sicily, and the scenes of his adventures are laid in Syracuse during the early Christian centuries, when the hills about the city were still crowned with Saracenic masques and with the ruins of Grecian temples. Yet the volume can scarcely be called an historical novel, for the author deals with myths and legends rather than with established facts. Besides, some purely imaginary conceptions belong as truly to the romantic atmosphere of the past as realism does to the present, and Mr. McCarthy has simply discovered a beauty spot shining like a disk of happy charm and colors far down the hill of time. Into this radiance he has crowded the fiction of his mind, because chronologically the conception belonged to that era. The novel has been dramatized and played successfully in New York.

War

Even yet war may be averted, but it seems unlikely. It will be the middle of the week before the Japanese Ambassador can leave St. Petersburg, or the Russian leave Tokyo. Within that time the Russian answer may be made known, and it is possible that the mediation of Great Britain and France may avert war, but we can hardly expect it. There may be a naval battle before these lines are read.

Japan's assigned reason for the breaking off of diplomatic relations is the provoking delay of Russia to answer her note of three and a half weeks previous, a note which asked a speedy answer. Altho persistently asked for a reply none came. But meanwhile the Russians were strengthening their position and preparing for war. If war must come, if Russia's reply were finally unsatisfactory, delay would be most damaging to Japan. She did not believe that Russia was sincere in her desire for peace. It is clear, however, that Japan knew, through Russian advices to Paris, what the Russian reply would be, and that it did not meet Japan's irreducible demands; and this made it clear that the delay in sending the answer was for military and not diplomatic reasons.

It is a mistake to suppose that the difference is chiefly about Korea; it is about Manchuria. After the war of China and Japan, Russia and Germany forbade Japan to occupy a corner of Manchuria, saying that it would menace the integrity of Korea and China; now Russia takes possession of the whole of Manchuria. Japan and Great Britain and France and the United States and the rest of the world are commercially interested in maintaining the integrity of China and Korea, but Japan most of all. She knows that if Russia takes Manchuria it threatens the absorption of Korea and the partition of China, and the safety of Japan herself. She wants the two yellow empires maintained as against white invasion and division. Great Britain and the United States want the same. We have pledged our word to help maintain their integrity. Japan is fighting for her own interests, but also for the interests of all the other nations which desire an open door in the East. Perhaps we may not help her, but we should be very sorry to see her beaten.

But Russia claims to be fighting the battle of Christendom against a pagan nation. It is not so easy to say which is the Christian nation. Japan allows liberty of conscience. There are members of Christian churches who command her battle ships, who sit in her Cabinets, who preside over her Parliament. There is the full civilization that has grown out of Christianity; public schools, the best education, the institutions of business and benevolence which are the product of Christianity. This has been given to Japan under the tutelage of Christian nations, frankly adopted from this and other countries. There is a constitutional Government, elected rulers, courts and freedom.

But what do we see in Russia? An absolutely autocratic Government, with no local self-government, no Congress, no Constitution, no public school system, no religious liberty, the Dukhobors, the Jews and the Lutheran Finns equally forced into exile, and the Armenians in the Caucasus driven to frenzy by the robbery of their churches and schools. Which is the Christian country?

We have no prescience that other men do not possess, and no more power than they to foretell the result of the impending conflict. But we confess to an interest in the longer look ahead. And there are elements in the situation which, in this instance, make the remoter consequences of the conflict momentous to the human race.

The history of Russia for a hundred years has been marked by one peculiarity which sets that Power apart from all others in the sisterhood of nations. Tirelessly she has pursued one clearly defined

end. Her gigantic territory, stretching more than half way across one continent, and entirely across another, is shut off from the pathways of ocean commerce. She can never become one of the great commercial nations until she has territorial continuity from her Arctic zone to Atlantic and Pacific ports that are open throughout the year—that is, to Constantinople and Tientsin. That a nation which possesses limitless natural resources, and a population from which an army greater than that of any other European Power can be recruited, has submitted, on the whole, so quietly for more than two generations to the thwarting of this purpose, is in itself an ominous fact. It shows a reserve power, a self-control, a dauntless persistency, which bodes nothing but ultimate destruction to any less powerful opponent.

If Russia, in the pursuit of her one great end, succeeds in extending her power over a large part of the Chinese Empire, the ultimate result will be a commingling of the bloods of Mongolia, Manchuria, Eastern Siberia, and of these with the western blood of European Russia. One vast empire will exist, throughout which the people will become homogeneous, not only in institutions and ideas, but also in physical constitution. It will be an empire in which the brains of the West will organize the swarming populations of the East for the industrial exploitation of the limitless resources of East and West together. The time could not be long delayed when industrial evolution, going on by leaps and bounds in such an empire, would create such fabulous wealth that Russia would be no longer compelled to raise loans for military purposes in the banking houses of Western Europe and of America.

What would be the relation of the rest of the world to such a Power? Is there any one nation in the world that could resist her if she chose to put forth her strength? How long could the United States, for example, maintain the policy of excluding the Chinese not only from our continental domain, but also from Hawaii and the Philippines, if Russia decided that an outlet for her millions of Chinese subjects into other parts of the world was economically and for other reasons desirable? How could any trade policy objectionable to such a Power be maintained by the United States, by Germany or by England?

There are, however, quite other possibilities in the situation that call for consideration. Russia is a despotism. The millions of her population are for the most part inconceivably ignorant and superstitious. The Government does not favor an energetic policy of popular education. What would be the effect upon mankind in general if the controlling power in international affairs should be an absolutism wedded to a Church that is even more hostile to scientific enlightenment than any Church that has wielded power in Western Europe? Would there be another thousand years of social night, as in the Dark Ages?

The element of uncertainty is found, however, in the internal unrest that vexes European Russia. The enlightened classes there have vainly been endeavoring to establish political liberty. They have struggled almost against hope to kindle the fires of revolution. By thousands they have been consigned to dungeons and the convict mines. Can Russia enter upon a prolonged career of militarism, in a final attempt to extend her boundaries southward, without so far drawing upon her present resources that it will become necessary, in the interests of economic progress, to relax the stringency of her domestic administration, and give freer scope to liberty of thought and to private initiative? Or, if she should succeed in obtaining both Eastern and Western ports, and enter upon a career of commercial development, could she thus live in contact with the Western world and enter into full competition with Western industries without being internally transformed? At some time, undoubtedly, the domestic evolution would follow upon the wider world intercourse. But would the changes come before the Western world had lost some measure of its present freedom and spontaneity? This is the ultimate question that will confront mankind if Russia wins in the impending struggle.

But if victory awaits the arms of Japan, what then? Will Russia's aims be defeated or their accomplishment only delayed? In the delay itself there might be immeasurable gain. The future of

China depends on the success of Japan, which is fighting China's war. One generation has created a mighty empire in Japan; another generation would suffice to create a mightier empire in China that would be well able to hold Russia in check. But what would be the influence on the world of a really powerful Chinese Empire? For Russia our hope must be that her internal transformation may come about before her ability to assume a leading *rôle* in the affairs of the world is assured.

The Law and the Shipyard Trust

A SETTLEMENT was reached last week by the contending parties in the Shipyard Trust controversy. It appears that the complaining bondholders, the Receiver, Mr. Charles M. Schwab, and the original reorganization committee have agreed to an obliteration of the Trust's entire capital stock of $45,000,000, and to the issue of $30,000,000 of new stock (with $3,000,000 of bonds), for which the original $26,000,000 of bonds may be exchanged at certain rates. All the interests have been consulted—except those of the public, of persons who exchanged real money for stock, and of a few investors who, like Governor Odell, were induced to pay 93½ for bonds. Mr. Schwab, who obtained control of the property by those curious methods which have been the subject of enormous quantities of testimony, has at last been constrained to yield. If we take no account of the uncertain purposes of Governor Odell and of the unknown buyers of shares, there has been a settlement with every opposing or dissatisfied interest—except the law.

Whitaker Wright was prosecuted and sentenced to suffer penal servitude for having made false statements about the affairs of his companies. Our laws concerning the financial management of corporations are not so strict as those of England, but in this case we have official reports and other evidence to the effect that they have been violated. The charge is made repeatedly in the report of Receiver Smith to the United States District Court, the report in which he characterized this Shipyard Trust as an "artistic swindle." It is made in the recent annual report of the New York State Superintendent of Banks, who says that in their financial dealings with this Trust the officers of the Trust Company of the Republic "flagrantly transgressed the laws." In its application to the Stock Exchange for a listing of its shares, in order that they might more easily be unloaded upon the public, the Shipyard Trust's officers made misleading and false statements as to the financial condition of the property. For a similar offense the London Stock Exchange prosecuted Whitaker Wright. Why should not the New York Stock Exchange prosecute these offenders, or, at least, brand them by its denunciation?

We shall not tell here the story of the formation and of the brief, but wretched, career of this Shipyard combination. The apparently endless inquiry caused by the suit of a few bondholders has given to the public hundreds of columns of testimony, with which those who read the daily papers are more or less familiar. But we shall direct attention to a few facts established by the official record, which includes the report of the Receiver. The value of the associated companies, as generously estimated by themselves, was about $12,500,000. For them was paid $68,000,000 in bonds and stock. The company was incorporated under the accommodating laws of New Jersey by three clerks of a Trust Company, one of whom had performed a similar service for the notorious Franklin Syndicate, a get-rich-quick "investment company," whose managers and beneficiaries, Miller and Ammon, are now in Sing Sing prison. These three clerks assigned their rights (based upon half-a-dozen shares of stock, for which they had not paid and of which there is no record) to three other clerks of the same institution, who acted as President, Vice-President, Secretary-Treasurer and Board of Directors, and who, in these capacities, increased the capital from $3,000 to $71,000,000, and paid this $71,000,000 for the several properties. They would not have known a steel factory or a shipyard if they had met one in the road. Is there no law to prevent such use of dummy Directors and officers? Is there no defense for the

public against such absurdities and wrongs?

The negotiations with Mr. Schwab for the purchase of the Bethlehem Steel Works we analyzed some months ago. He had paid $7,200,000 for the property; he received for it $10,000,000 in bonds, $10,000,000 in preferred stock and $10,000,000 in common stock; but a part of the stock went to Mr. Morgan, who, for the Steel Syndicate, really controlled the Works. It was with respect to this stock that the remarkable agreement was made for the marketing of it before any other part of the stock of the company should be offered for sale. As Schwab's bonds had voting power, he thereafter controlled the Shipyard Company, through its Board of Directors; and it is charged by the Receiver and others that by the exercise of his power he withheld from the company the earnings of the Bethlehem Works. In fact, he did not sell the Works. He kept them and took over the Shipyard Company.

We cannot refer at length to the promotion operations of the amateur financier at the head of the Republic Trust Company, or the ridiculous and disgraceful attempts to procure subscriptions in Paris. The published correspondence concerning the adventures of the company's agents in that city we hope and believe to be without parallel in the history of American finance. No honest American can read it without a sense of humiliation and shame. Nor can we relate the recent history of this malodorous industrial Trust. But we do wish to point out in what ways, according to the Receiver's report and other evidence, the laws have been violated. It was charged in the report to the court that false reports concerning earnings and assets had been made; that the organizers' prospectus had been misleading and false with respect to the incorporation, the working capital, and the profits to be realized upon contracts on hand; that the Directors' minutes had been wilfully made to misrepresent the facts. It was recommended that suits be brought for the recovery of some $17,000,000 in stock given to various persons as bonuses. It was asserted that mortgages given to secure certain bonds were a fraud upon the company's creditors.

Ought not these charges and those of the Superintendent of Banking to be heard in the courts? A failure to make such use of them tends to confirm the assertions of those who say that there is one law for the rich and another for the poor, and that the "money power" is supreme. Mr. Bryan, in his paper last week, spoke of the vigorous prosecution, by the Federal authorities, of Frank and John Jager, officers of a mining company, because they had misrepresented the value of their property in a prospectus sent through the mails. Here is his comment:

> "It is well known that the managers of the Shipbuilding Trust were guilty of the same offense with which the Jager Brothers are charged. They sent through the mails matter misrepresenting their property. How does it happen that all the power of the Federal authorities is exerted to punish these comparatively insignificant men, while the wrongdoing of the millionaires who manipulated the Shipbuilding Trust, and defrauded many people out of thousands and thousands of dollars, has been utterly ignored?"

In view of the reports of the Receiver and the Superintendent of Banks, Mr. Bryan's remarks do not seem unreasonable. But in this case it is the duty of State authorities, rather than that of the Federal Government, to enforce the laws. This duty is not affected by a reorganization agreement or by the conciliation of any complaining investor in the so-called securities of the Shipyard Company.

The Passing of St. Valentine

WHAT has become of St. Valentine's Day? The fourteenth of February is still on the calendar, but it is no longer a red letter day, and because very few more letters are written for that day than for the others. On February 14th, 1847, the London post office was swamped with 400,000 letters, many of them valentines, and THE INDEPENDENT is old enough to remember when the letter carriers complained as much over the rush of business on this day as they do now over Christmas week.

The number of maidens whose hearts beat wildly at the appearance of the postman on this day is diminishing, and each year there are fewer young men spending

TO VOTE A STRAIGHT TICKET, MAKE A CROSS (×) MARK WITHIN THE CIRCLE ABOVE ONE OF THE PARTY COLUMNS.
TO VOTE A SPLIT TICKET, THAT IS, FOR CANDIDATES OF DIFFERENT PARTIES, THE VOTER SHOULD MAKE A CROSS (×) MARK BEFORE THE NAME OF EACH CANDIDATE FOR WHOM HE VOTES.

LOVE TICKET	FRIENDSHIP TICKET	INDEPENDENT TICKET	MARBLE HEART TICKET
For Governor, YOURSELF.	I am your friend.		I do not care for you
For Lieutenant-Governor, MYSELF.	I respect you.		I have no use for you.
For Supporter, YOU.	I admire you.		You make me tired
For Treasurer, ONLY ME.	I like you		I cannot abide you.
For Secretary of State, YOU.	I wish to know you better.		You are a nuisance.
For Comptroller, ME.			Don't bother me any more.

A Modern Valentine

their evenings at the distracting task of reducing their passion to a rhythmical pace. In the rise of commercialism it was found cheaper to buy poetry than to make it, and it came to be thought that a quatrain in embossed gilt letters with a filigree frame which pulled out was better than a fair copy of a blotted and interlined poem, bearing the marks of perspiration as well as inspiration.

These sale sentiments were displaced by the comics, and now even stores on the side streets scarcely think it worth while to get up a window display. As an awful example of the decline of the valentine we reproduce one which we are told finds most favor with the youth of to-day. Love-making has gone into politics, and consorts are elected by the Australian ballot. It is labor-saving. One does not have to know how to write poetry, or even prose; he only makes his mark at the head and votes a straight ticket.

This is far from the days of Pepys (which, if you are fashionable, you will pronounce Pips). Valetines then were "done by himself, on blue paper in gold letters, very pretty." At that time it cost something to be a valentine. Mr. Pepys had to give his valentine five pounds, and he congratulates himself because that year his wife happened to be his valentine and he bought her something that he would have had to pay for anyway. Next year, he says, he was lucky, too, in drawing the name of a little girl who would not expect an expensive present.

It was a very old custom, that of selecting one's valentine by drawing a name from a box, probably in the idea that marriage is a lottery anyway and so might as well take that form. The celebration of the day goes back far beyond the Christian era, and its customs have no connection with the real St. Valentine, who suffered martyrdom in 270 A. D. by losing his head. His devotees suffer martyrdom by losing their hearts, altho some of them follow their patron saint more closely and lose their heads, instead or besides. His tomb is in St. Praxed's Church, where Browning's bishop ordered his, and few there are who worship at his shrine.

Le roi est mort. Vive le roi. As St. Valentine has gone out of fashion, a new saint is necessary, a saint for the bachelor maid. With its marvelous adaptation to the needs of human nature, which

aroused the admiration of Hawthorne and Macauley, the Catholic Church has provided one, for who can so well stand for the ideal of the new woman as Joan of Arc? One who shocked the conventionalities of her time by deserting the spinning-wheel, adopting masculine apparel and riding off to the wars astride of a horse, must surely be ready to hear sympathetically the prayers of the modern maiden who desires athletic triumphs or wishes to succeed in some hitherto masculine field of endeavor.

It is vain to regret the disappearance of old customs, and there is probably no real reason to mourn the decline of Valentine's Day. It is not necessary that young people shall mate on this day just because the birds are supposed to, and they can find other ways of expressing sentiments than by riven hearts and rimes. But what puzzles us is how do the young men and women nowadays express their sentiment, and have they any to express? In how far is an emotion dependent on the symbols of its expression? Is it chance that concomitantly with the decline in the number of valentines comes a rise in the number of divorces? A marriage of convenience is easily thrown off whenever it comes to be felt a marriage of inconvenience. The couples who never fall in love, speedily fall out. Unless the dawn of *Vita Nuova* is rosy there is little likelihood that the sky will remain unclouded throughout the live-long day and that the snowy peaks of old age will be tinged with the evening glow. To say "I love you" to a woman is easy, but to prove it requires a lifetime of service and devotion. Unless one starts in the race with red blood rushing in his veins he is likely to falter on the long course.

Professor Briggs's Address

In the introduction to Professor Briggs's late address before the Episcopal Church Club we said that it was "the paper read by him." *The Church Standard,* which has severely attacked the address, tells us that it was impossible for us to know that it was the identical paper as read, and it gives us to understand very plainly that the paper had been revised and omissions and changes made to avoid the criticisms passed upon it.

We are happy to relieve *The Church Standard* of its suspicions. Professor Briggs gave us the manuscript precisely as he read it, with no revisions or omissions. We say what we know. We made, for brevity's sake, only three omissions. One was in the body of the article, a dozen or two lines containing solely quotations from Scripture on unity. A second was the rhapsodic apostrophe to Love with which the address closed. The third was the introduction, which, as it has developed some importance from the criticisms made on the propriety of such an address, we give herewith:

> You have requested me to speak to you upon this question ["How may we Become More Truly Catholic?"]. I have been assured that you desire me to open it up, to discuss it thoroughly, and with the utmost frankness. This is what I propose to do, so far as my knowledge and ability may carry me. It is a difficult and delicate question from start to finish; and so soon as it is opened up numberless other questions arise of like difficulty, delicacy and importance. I shall do my best with these, so far as they are relevant to the main question, but I shall strive to avoid side issues. I ask your earnest and charitable attention, for you will doubtless hear many things that may be novel to you, and others not in accord with your cherished opinions and convictions. I have no other purpose than to present to you facts and truths as I see them. My interest is historic, irenic and practical.
>
> The question I propose to discuss is based on my article published last July in *The American Journal of Theology,* entitled "Catholic, the Name and the Thing." In that article I show by strict historical investigation how the term *Catholic* came into existence to represent the three great constituent elements, Holiness, Universality and Apostolicity, as expressed in the formula, *The Holy Catholic Apostolic Church.* The earliest of these was *Holy Church,* as used in the primitive Roman Creed; then *Holy Catholic Church,* as given in the present form of the Apostles' Creed, and finally *The One Catholic Apostolic Church* of the Nicene Creed. The term *Catholic,* however, in its historic usage, stands for the three. We shall take these up in the reverse order, in order that we may rise from the least important to the climax and most important.

It will be seen that it is but fair to Professor Briggs to observe that he sought to initiate no debate. He spoke

by request, on a subject suggested to him, before a private club of half a hundred gentlemen, where presumably there would be no reporters. *The Church Standard* is right in allowing that as printed, and we say, as delivered, it was not of a "wilfully provocative character." Having delivered his address, in courteous answer to their request, and in the to-be-presumed freedom of a club of gentlemen of the Episcopal Church, when they asked him questions he answered them frankly. But some one did report the address, and made the most of the answers to questions. It was chiefly one of these oral answers which stirred up the subsequent severe attacks which called out the full publication in THE INDEPENDENT.

The utterance, not in Professor Briggs's address, but in the oral answers, at which chief offense was taken, was his statement that he felt a personal humiliation in the way in which he was required to apply as a layman for ordination as a deacon and priest of the Episcopal Church. Professor Briggs's paper ought to make it clear to any one that it was not the re-ordination itself to which he objected; he would not object to a dozen ordinations. He would like it if the Roman Catholic Church would give its ordination also to the Protestant clergy, in the interests of Church union. What we imagine he may have felt to be uncalled for was the requirement of the canon, which could easily be changed, that an ordained clergymen coming from another denomination, no matter what may be his established record, must solicit the indorsement of eight laymen to his good character. One would think that in such cases the indorsement of personal character might be left to the discretion of the clergy who recommended him for admission to their priesthood.

The editor of *The Church Standard* wishes to drop the discussion which he has initiated. But he does it with this Parthian enumeration of the errors in Professor Briggs's address:

"Fourteen positive statements (mostly of fact) and 8 implied statements, all of which any intelligent Episcopalian, whether High or Low, would promptly challenge; 4 assumptions which no Episcopalian would admit without at least some shadow of proof (and Dr. Briggs gives none); 7 instances of confusion of thought and language into which no man of academic education ought to fall; and 4 irrelevant passages which have nothing on earth to do with the merits of the matter at issue."

As all of these 37 inculpations are "generously" left unspecified, to avoid further conflict and damage, we cannot judge of their literary or historical criminality, altho their number appalls us. We only say that we regret that the very able editor of *The Church Standard* should have taken up his heaviest cudgels against Professor Briggs on a report which he finds misleading; and we are the more surprised because in the main contention, that of the recognition of a non-episcopally ordained clergy, we understand that Professor Briggs and the editor are very nearly at one. We have been greatly pleased with the advanced position *The Church Standard* has lately taken on this subject.

The Call of the Tame

THE rapid and accelerating influx of people into the cities, resulting everywhere to a relative, and in many places to a positive, depopulation of the country districts, is one of the most interesting of the social phenomena of our time. New methods of rapid transit, of building and of sanitation make larger cities continually more practicable, and concomitantly with increase in the material facilities more people are acquiring that most difficult of the liberal arts, the art of living together.

This art is acquired by a series of compromises, by continually trading off more of one's individuality for the privilege of associating with other people. The isolated tree on the hill-top develops individuality. Its youthful twigs are thrust out in any direction and grow into large irregular branches, close to the ground. From its unaided battle with the elements it becomes tough and twisted and gnarled. The trees of the forest are straight, stiff and uniform; they are both taller and weaker. They can only show individuality by some slight and temporary differences in the growth of their topmost limbs and foliage.

As the countryman arrives in the city the first thing he finds out is that he must catch step with the crowd. It matters not what gait he has become accustomed

to; that which is best suited to his reaction-time and his respiration, and which is the result of a compromise between his ambition and his leg-length. He must reduce himself to the average; he must divide by the common denominator. Here is no band whose accented notes he can follow. He can see no drum major whose staff sways to the beat. There are no drill regulations to prescribe the length of his step. But he cannot hesitate on the edge of the current. He must "fall in" at once and catch step with the pace set by the majority, a ruling body which is always in session, executes its own laws and from which there is no appeal. If he walk slower he becomes a public nuisance and is buffeted from behind. He cannot go faster save at the disadvantage of continually going around people and losing time by having to walk further to gain the same distance. So he, too, catches the swing of the invisible and inaudible metronome.

Next after the adjustment of his feet comes the adjustment of his head. There are so many people in the world that it is very difficult for an ordinary man to be original. But in the way in which he dimples his hat even a man of no unusual ability can show some idiosyncrasy. It was a great relaxation in discipline when our army substituted the soft hat for the cap. As soon as a man is allowed to misshape his own hat it opens the way for all sorts of irregularities. Foreign military critics began to complain that our soldiers were not an army but a crowd. Military discipline and obedience depends on uniformity, and this can only be attained when the outside, and as far as possible the inside, of the heads are made to conform to a common standard. This is most efficiently attained by the stiff hat, the helmet or the Derby. When one looks down from a bridge on a street-full of smooth round crowns, bobbing along like a school of porpoises or a herd of sheep, he wonders if the brains beneath must not in some degree be molded to the same shape. The head shapes the soft hat, but in the case of the stiff hat this is reversed. Since the sutures remain movable for the first twenty-five years of a man's life, it would seem plausible that the man who shapes the hat-block has a hand in shaping the destinies of the nation.

In the country each house has a certain individuality. It may, for example, be picturesquely ugly, unpicturesquely ugly or plain. But in the city a man has little to go by in finding his home except the number, and the stranger finds it hard to remember that. His homing instinct has to be guided mostly by whether his apartment is in a house with a high stoop, and how far it is from a lamp post; and he gets off the car at the proper cross-road by noticing whether there are three saloons and a drug store or three saloons and a grocery. To the newcomer numbers are mere numbers, differing only in magnitude and sequence; but to the city-dweller they bear esoteric connotations, and *Fourth* avenue sounds to him quite different from *Fifth* avenue. Nineveh was one of the largest of ancient cities and in it, according to divine authority, there were six score thousand persons that could not discern between their right hand and their left hand, but probably even these knew the difference, socially and financially, between the East Side and the West Side of that city.

As long as a man can whistle he can call his soul his own, but when he can no longer indulge in that cheering amusement, except after dark on a side street and using the soft pedal, he begins to doubt whether in a city a man has a soul of his own. He is assured by biological sociologists that society is an organism and he hears of "municipal righteousness" and "civic duties," so it must be there is a soul of the city, and his own is not destroyed but in some way merged into this syndicate soul. But this conception, like pantheism, is rather difficult to realize at first, and the green countryman asks himself what it profits a man to lose his own soul to gain an individual three-millionth interest in a "civic consciousness."

"Inveterate Alumni"

It is a creditable thing to graduate from a university at the age of twenty. At the age of forty there are some other things that a normal man should have accomplished besides having graduated. Yet to hear many of the middle-aged "grads" talk at their alumni dinners one would think that the greatest honor in life was having their names in the triennial catalog, and the only infallible test

of college loyalty was to cheer themselves hoarse at the football games and attend all the annual reunions. We are glad to believe that the graduates of this type are in the minority. Still, being the noisiest, they generally predominate at the alumni meetings, to the disgust of sensible men. These "inveterate alumni," as they have been aptly termed, are the college graduates whom Horace Greeley must have had in mind when he spoke of the whole species as "horned cattle." We are led to these general observations from reading in the *Princeton Tiger* the only serious editorial on a non-athletic topic we have ever seen in a college funny paper. The *Tiger,* apparently voicing inmost Princeton, casts out George B. McClellan, recently elected Mayor of New York City, and a graduate of the great New Jersey university. Princeton has a very strong alumni association in this town; but, apparently, since graduating in 1886, Mayor McClellan has been employing his time in doing something in the world, instead of watching the tigers (Princeton, not Tammany) beat the Elis once out of four times, and dutifully attending the Princeton Club. As a result the New York Princeton alumni, on the ground that "he is not a good Princeton man," refuse to give him a complimentary dinner, such as would be expected when one of Princeton's sons attained the enviable honor of becoming Mayor of the metropolis of the earth. Now if Mayor McClellan does not wax crazy over Princeton (and it is conceivable that an honest man may see a few faults in his alma mater), and if the Princeton graduates do not hold him in personal esteem, we do not see why they are obliged to give him a dinner. But if the sole ground of their complaint is that the Mayor has had more important things to attend to since leaving old Nassau than parading his "college spirit" before the world, we are sorry for Princeton's idea of what constitutes honor among alumni.

French Prizes for Science

Director W. W. Campbell, of the Lick Observatory, has been awarded the Lalande prize by the Paris Academy of Sciences for the most important work in astronomy. This calls attention to the generous policy which the French authorities have generally pursued in affording privileges and honoring achievement in art and science without regard to national lines. Among the international prizes offered by the Academy of Sciences for 1904, in addition to the Lalande prize, are the Leconte prize ($10,000) for a capital discovery in mathematics, physics, chemistry, natural history or medicine; the Wilde prize ($800) for a discovery in astronomy, physics, mineralogy, geology or experimental mechanics; the Tchihatchef prize ($600) for exploration in Asia, and the Desmazières prize for a work on the cryptogams. Altogether nearly $60,000 are offered by the Paris Academy next year in some fifty prizes, of which the largest is the Bréant prize of $20,000 for a cure or method of suppression of Asiatic cholera. Our American Academy of Sciences has only a few small sums of money for the encouragement of research in this country by prizes, and the American Association for the Advancement of Science and the Smithsonian Institution can add but little to the list. The grants of the Carnegie Institution are not in the nature of prizes, but are given to defray the expense of some proposed research.

Statistics of the Churches

Dr. H. K. Carroll's valuable annual statistics of the churches in the United States are presented in *The Christian Advocate.* They show a gain for the year of 2,340 ministers, 2,647 churches, and 482,459 communicants, out of a total of 29,323,158 communicants, which is a very fair gain. Of a number of the smaller denominations it has been impossible to get statistics, and the old figures remain unchanged. The chief element of doubt in the figures relates to the Roman Catholics, who have no statistics of members, but only estimates of population, based on the number of baptisms and deaths. From this estimated population fifteen per cent. is deducted for children not yet confirmed, which makes the Catholic gain for the year 166,010. But we thought that many more immigrants that that had come in. The larger denominations are put in this or-

der: Catholics, 9,762,264 communicants; Northern Methodists, 2,822,765; Southern Baptists, 1,777,466; Colored Baptists, 1,625,330; Southern Methodists, 1,533,766; Disciples, 1,235,798; Northern Presbyterians, 1,044,161; Northern Baptists, 1,023,438; African Methodists, 785,000; Episcopalians, 773,261; Congregationalists, 659,704; African M. E. Church, 551,591; Lutheran Synodical, 546,341. No other body has more than 400,000 members. It is a great pity that the last census gave us no such careful religious statistics as Dr. Carroll compiled for the census of 1890.

The Baltimore Fire

There is nothing to be said, as yet, about the Baltimore fire, except to express the universal sympathy of the country and the world with those who have lost so much, and their deep regrets that one of the fairest and most historic of our cities should thus have suffered. There is but one solace in connection with such a loss. It is the assurance that, as in the cases of the Chicago and Boston fires, with which this counts as of similar magnitude, the burnt blocks will be rebuilt in such a substantial way as will not only reduce the danger of a second conflagration, but will provide a fairer and more monumental city. It would seem that we have not yet learned how to make even new sky-scrapers really fireproof against a terrible rush of flame and wind. In this case it is not easy to say what foresight was lacking. Immediate notice was given of the outbreak of fire; the department was ready and did all it could; but the inflammable nature of the contents of the warehouses and the high wind made all efforts futile to stop the course of the flames. Through such great conflagrations and terrible losses cities are regenerated, while general sympathy and assistance make the loss easier to bear.

John Thorgeirson writes us from Thistle, Utah:

I hold the degree of a High Priest in the Mormon Church, and I have been through the Temple and received my endowments, and seen them administered to others over and over again; and the truth is that there is no oath administered in the Temple, and not even one word said to encourage one to be disloyal to the United States. There is no oath connected with any ordination, nor with any official act or installation in the Mormon Church. Polygamy is no longer a part of our religion, and is never taught, nor entered into. We believe that it is in the United States that Christ will establish his Millennial reign.

We have no doubt that a multitude of such witnesses can be brought in defense of Mr. Smoot's right to a seat in the United States Senate.

It was a curious alliance of evil with good that killed the bill in the Kentucky Legislature for the disfranchisement of negroes. It was the Saloon Trust that did it. The week before the trust had defeated the Local Option bill in the Senate for this year. But if the negroes should be disfranchised their votes would be lost for the saloon, where they are its steady patrons; and another year the advocates of local option might carry the State and shut out the saloon from dozens of counties as they have in Georgia and Texas. So the negroes must be allowed to vote, when their vote is wanted and will be counted.

Senator Hanna's sickness disturbs the wire-pullers, who are trying so hard to manufacture public sentiment in opposition to the nomination of President Roosevelt. Whatever the reports they bring, somehow whenever any action is taken, it is in line with an instruction of delegates for Roosevelt. It still looks as if he would be nominated practically by acclamation and elected by an overwhelming majority despite the maneuvers of the corporate interests which do not desire legal control.

It is to the honor of the Princeton College freshmen that they, under their franchise of self-government expelled from the college several of their class who had bought and used stolen examination papers. We see no reason why there should be any tenderness shown the offenders, or that they should be let off with a short vacation. The lesson of honor is as well worth teaching as anything that will be learnt from Tacitus or Fresenius.

Financial

Trade and Industry

THE negotiation of a loan of $50,000,000 by the Pennsylvania Company, for an enlargement of its traffic facilities between Pittsburg and Chicago, is an encouraging indication of the general situation in the opening months of the new year. Additional importance must be given to this loan if it should appear that it is in any way related to a final settlement of the quarrel between the Pennsylvania and the Gould-Rockefeller railway interests. Up to the present time, however, rumors asserting such a relation have been denied, upon what seems to be good authority. Since the latter part of November there has been a decided increase of confidence in the circles of trade and industry, altho conservatism is still the rule. No general reduction of wages is now expected.

As we look back over the record of 1903, these are the chief elements or supports of prosperity whose influence will extend into the present year: Abundant crops, sold at good prices; the favorable condition of agriculturists; heavy railroad traffic, with a large increase of gross earnings; a great volume of domestic trade; foreign trade exceeding that of any previous calendar year; a sound currency; the strength shown by our banks and other similar institutions during the remarkable decline that has cut off a rank growth of fictitious share values. On the other hand, this decline embarrassed many and has caused retrenchment. In the iron and cotton mill industries wages have been reduced, and this tends to impair the purchasing power of the public. An increase of railway net earnings over those of 1903 cannot be expected. What were called "Wall Street losses" were not confined to New York, but have been widely distributed. It is not probable that the suicidal folly by which organized labor paralyzed the building industry last year will be repeated. As a rule, the railroad companies will be more conservative in expenditure than they were in 1903. Much will depend upon the year's crops, the volume of our exports, the attitude of organized labor toward employers who plan retrenchment, and the policy of great and overcapitalized industrial corporations. The foundations of our industrial and financial fabric are sound and strong at the present time.

Shipbuilding Reorganization

THE Reorganization Committee of the United States Shipbuilding Company (the members of which are George R. Sheldon, chairman, Charles S. Fairchild, John E. Borne, Pliny Fisk and Charles W. Wetmore) have adopted a plan prepared, at their request, by Receiver Smith. It is proposed that the new company's securities shall be $3,000,000 of 6 per cent. gold bonds, $15,000,000 of 7 per cent. non-cumulative preferred stock and $15,000,000 of common stock. These bonds and all of the stock are to be allotted in certain proportions, duly stated, to the holders of the two classes of existing bonds. The new company's fixed charges will be only $897,550. It should be noted, as tending to inspire confidence in the reorganization, that the members of the first Board of Directors are to be selected by agreement between Receiver Smith and the committee, and with the approval of Thomas F. Ryan, representing the Syndicate Managers (who are the Morton Trust Company and Mr. Ryan, their counsel being Mr. Elihu Root) and that these Managers have made a selling agreement with Harvey Fisk & Sons, relating to subscriptions for the new bonds and the sale of them. Mr. William Nelson Cromwell is counsel for the Reorganization Committee, from which, it will be observed, Mr. Max Pam retires, his place being taken by Mr. Fisk.

....Dividends announced:

Buffalo, Rochester & Pittsburg R'way, Preferred, 3 per cent., payable February 5th.

Buffalo, Rochester & Pittsburg R'way, Common, 3 per cent., payable February 5th.

Amer. Chicle Co, 1 per cent, payable February 20th.

Union Pac R.R. Co., Preferred and Common, $2.00 per share, payable April 1st.

Père Marquette R.R. Co., Preferred, 2 per cent, payable February 19th.

Niles-Bement-Pond Co., Preferred, 1½ per cent., payable February 15th.

Niles-Bement-Pond Co., Common, 4 per cent., 2 per cent. payable March 19th, 2 per cent. payable June 18th.

Insurance

Life Insurance in Business

EVERY one knows something of the uncertainties of business and how few there are who do not sooner or later become wrecks upon the commercial ocean. The periodical reports from the commercial agencies serve to frequently remind us of this. Every man who establishes himself in merchandising courts failure from several causes. Among these are incompetence, inexperience, insufficient capital, bad judgment in the granting of credits, outside speculation, neglect of business, personal extravagance and fraudulent disposition of property. There are also other causes of failure entirely outside of these which are due to causes not to be foreseen or guarded against. It is, however, doubtless well within the truth to say that seventy-five per cent. of all failures are due to faults on the part of those who fail. With the acceptance of the truth of such a statement it behooves the business man to ponder well the things that are for or against him in his fight for triumph in business in the face of competition that grows fiercer each year.

The question of life or partnership insurance in this connection is too often neglected or, it may be, is not considered at all. If life insurance is good in domestic affairs, in regard to which there is no question, how much more is it essential when large transactions, extending over long periods of time, are incidental to a man's business. Insurance is coming more and more into prominence as to its banking side, and conservative business men with life or partnership insurance must in the very nature of things be more acceptable credit risks than as if they lacked such insurance. There is not a credit man worthy the name who would not prefer the insured man to his uninsured brother as a risk.

An insurance policy is also an ever present asset in cases where temporary loans are required—as they are, from time to time, in all mercantile enterprises. The lack of a proper understanding of life insurance in its theoretical and practical sides alone accounts for the neglect of so many merchants to harness it in their own behalf.

Improved Method of Safe Breaking

AMID the many improvements that are taking place in all departments of life, with the insurance companies and elsewhere, it would be strange if the astute cracksman should halt in his methods. Nor has he. On the contrary, he is rapidly discarding the use of dynamite and similar high explosives in his professional work. By way of substitution he now resorts to the far less dangerous but quite as effective and much improved method of inverting a safe that has attracted him with its possibilities and drilling through its bottom. The strength of a safe, like that of a chain, cannot exceed its weakest part, and the modern burglar seems to have recognized a safe's most vulnerable part and to have concentrated his efforts upon it. Insurance companies covering the hazards of burglary had best consider that the world moves as to crime and criminals as well as elsewhere, and that the probabilities are that the improved method of safe cracking here touched upon that has recently been employed with great success will in the near future doubtless entirely displace the superannuated use of explosives.

Insurance Statement

THE CONNECTICUT MUTUAL LIFE INSURANCE COMPANY, OF HARTFORD, CONN.

On the following pages is printed the fifty-eighth annual report of the Connecticut Mutual Life Insurance Company, of which Colonel Jacob L. Greene is President. This report, which Colonel Greene makes to the members of the company, is quite as interesting a document as any of the reports that have hitherto been published. The admitted assets of the Connecticut Mutual are $64,932,954. The surplus is $4,629,812. The ratio of expenses of management to receipts during the year just closed was 12.08 per cent. The number of policies in force at the close of business on December 31st, 1903, was 70,150, and these represented binding insurance that amounted to $166,504,486. There was an increase in the company's premium income during 1903. The same is true as to the interest account. The net assets were increased, as was also the business in force. The mortality during 1903 fell below expectation. There was a decrease in the company's holdings of foreclosed real estate amounting to $773,920. The company continues to enjoy its full measure of prosperity.

The Independent

Vol. LVI NEW YORK, THURSDAY, FEBRUARY 18, 1904 No. 2881

Survey of the World

In the Field of Politics

The attitude of Charles F. Murphy, Tammany's chief, toward the candidacy of Judge Parker is quite unsatisfactory to the latter's friends. At an informal dinner in Albany last week several Tammany legislators hailed the Judge (who was present) as the candidate of their organization. On the following day, Mr. Murphy manifested his displeasure by an interview or statement, given to all the metropolitan papers, saying virtually that if these legislators desired to vote for Parker they must do it now, because they would have no opportunity to vote for him at the polls, and adding that he himself was perfectly sincere in favoring the nomination of Mr. Cleveland, believing him to be the strongest candidate. He thought, however, that the New York delegation ought not to be instructed for any man, and he gave notice that in the State convention he should "fight" against instructions. As Mr. Murphy, with the aid of the Democratic leaders in Buffalo (with whom he is in alliance) will control a majority of the delegates, his evident opposition to Parker tends to check any movement for the Judge in other States. It is thought that his purpose is so to control the delegation that its influence may be used to support the candidacy of Mayor McClellan.—Mr. Bryan, in his paper, urges those who agree with him to organize, in order that the party may be "saved from the designs of the plutocracy," saying that if the "reorganizers" should obtain control of the national convention, Mr. Cleveland would be the logical candidate. In Iowa, the supporters of Mr. Hearst, aided by the friends of Mr. Bryan, have outvoted their opponents in the State committee in fixing the date of the State convention.—The two Republican factions in Alabama have reached an agreement (involving the defeat of the Lily Whites), and will send a Roosevelt delegation to the convention in Chicago.—There are indications that the Republican nominee for the Vice-Presidency will be Senator Fairbanks. —In its report accompanying the Naval Appropriation bill, the House Committee expresses its disapproval of Senator Gorman's policy, recently announced, of preferring internal improvements to an increase of the navy:

> "If we judge public sentiment aright, it is in favor of the continuance of the policy of building up our navy. If we stopped now, we should be left behind the leading countries of the world. The American people will not introduce the policy of sacrificing the American navy for internal improvements, nor is there any necessity."

—For a time, on Friday last, it was thought that Senator Hanna was dying. He suffered from a severe chill, followed by great depression, and was kept alive only by oxygen and powerful stimulants. On Saturday he was better, but still in a critical condition. A relapse followed, and on Monday evening, after twenty-four hours of unconsciousness, he passed away.

The Panama Canal Treaty

It has been agreed in the Senate that the final vote upon the pending Panama Canal Treaty shall be taken on or before the 23d inst. Only fifteen Senators, it is now said, will oppose ratification on the final roll-call.—Minister Buchanan has

returned from Panama and appears to be no longer in the service of the Government. His work on the Isthmus has been finished, he says, and he is about to sail for Europe. It is reported in the press that the correspondence recently sent to the Senate included a letter from him (then at Panama) to Secretary Hay, making a remarkable proposition or suggestion for a settlement of Colombia's claim; and that this letter has been discussed in the Senate's executive sessions. Mr. Buchanan proposed, it is said, that Panama should be induced to use a part of the canal money in quietly buying up, in Europe, the bonds which represent Colombia's foreign debt, and that these should be turned over at their par value to Colombia in payment of Panama's share of that debt. It was his opinion, the report continues, that the bonds could be bought at 5 cents on the dollar. Thus, with $500,000, bonds having a par value of $10,000,000 could be purchased, and a surrender of them to Colombia, at par, would discharge Panama's obligation and give Colombia the sum which she was to receive from the United States under the Hay-Herran Canal treaty. The proposition was promptly rejected by Secretary Hay. It is also reported that the suggested operation in bonds has not commended Mr. Buchanan to the Senate as a diplomatist entitled to respect.

General Reyes and Colombia

General Reyes has gone to Paris to assist those Canal Company stockholders who oppose the projected sale of the company's property and rights to the United States. He holds that the transfer cannot lawfully be made without the consent of Colombia, which has not been given. In an interview before his departure from New York, he said he was confident that Colombia would accept arbitration even at the hands of the United States Supreme Court, being firmly persuaded of the essential fairness of the character of the American people. He denied that any influence hostile to the Hay-Herran treaty had been exerted at Bogota by our transcontinental railroads or by the owners of real estate in Nicaragua. Colombia would not make war upon the United States. His influence and that of the party which elected him President would be exerted to prevent that; but there might be annoying complications between Panama and Colombia if Colombia should be left with a real grievance. He had constantly counseled patience, but there were many Colombians who did not realize how great a Power the United States had come to be. Their capital had no railroad to either ocean. It was his purpose to maintain peace, following the example of Diaz in Mexico, and thus to encourage the development of Colombia's resources by foreign capital.—Reports from Cartagena show that the province of Bolivar is virtually in a state of rebellion, owing to the removal of General de Castro, Commander-in-Chief of the Colombian army, and the appointment of General Manjares in his place by the Bogota Government. This was done in the interest of Joaquin Velez, the Government's candidate for the Presidency against General Reyes, because De Castro and the Governor of Bolivar (Francisco Insignares) were supporters of Reyes, whose election, according to these reports, is not yet admitted. Marroquin sent 4,000 soldiers down to Cartagena, and with these General Manjares, on the 8th inst., took possession of Barranquilla. It is expected that Governor Insignares will be deposed. Those who now rule at Bogota appear to be less desirous than General Reyes to maintain peace and emulate the example of Mexico and Diaz.—Panama's new constitution has been completed, approved and submitted to the Junta for ratification. The clause authorizing the United States to intervene for the preservation of order was retained.

The Fire in Baltimore

Baltimore's great fire, which began at 10.50 a. m. on Sunday, the 7th, was under control before night on the 8th, and was completely overcome at midnight on that date. It had destroyed the heart of the business district, and caused a loss which is estimated, by an agreement of a score of fire insurance experts, at $85,000,000. The burned

district has an area of 150 acres. There were no residences in it, but it included the financial blocks, the brokers' offices, the wholesale trade and a considerable part of the retail trade of the highest class, the fire having swept away both sides of Baltimore Street, the city's "Broadway." Nearly all the banks, the great structures of the Trust companies, the large office buildings and all the newspaper buildings were destroyed. It should be said, however, that the lofty steel frame structures, of which there were half a dozen in the burned district, are in such a condition that they can be restored. Examination shows that their steel frames are intact and have suffered scarcely any injury. Owing to a lack of steel shutters, the fire entered through the windows, and the interior of each "sky-scraper" speedily became a furnace. As in other similar fires, brick and terra cotta exterior surfaces proved to be more durable than stone. Altho for a time in great danger, the Court House, Post Office and City Hall (on the northern edge of the burned district) were spared. In all, about 2,500 buildings were destroyed. From the starting point in the warehouse of Hurst & Co. the flames made their way westward, and then southwestward, owing to the direction of the wind. The work of nearly 100 fire engines had very little effect during the first 24 hours. A final stand against the fire was made on the bridges that cross the narrow creek or canal that passes through the city, by the ten powerful engines and fire companies from New York, which had arrived at a time when the local firemen were completely fagged out. According to the testimony of Baltimore's fire chief, the New York companies prevented the fire from crossing the creek, and thus saved East Baltimore, with its grain elevators, factories and homes of the poor. The burned district extends from Liberty Street, on the west, to this creek (called Jones Falls), on the east, and from Lexington Street, on the north, to Pratt Street and the Basin, on the south. Banks and Trust companies lost no securities or cash; the contents of their vaults were found to be in good condition. Only one life was lost, that of a woman, who died in a hospital from shock. Beginning to burn on Sunday, the fire found the stores, banks and office buildings deserted by those who were accustomed to be in them on week days. There are no homeless residents to be cared for, but at least 25,000 employees are out of work. By authority of the Legislature, a legal holiday of ten days was declared, and this holiday has since been prolonged to the 23d inst. The people of Baltimore have decided to decline offers of financial help from abroad, and have shown commendable courage in facing the situation and preparing to rebuild the district laid waste by the flames.

Labor Controversies

At Coal Creek, forty miles northeast of Knoxville, Tenn., last week, three union miners and a railroad workman were killed by guards employed by a coal company to escort non-union employees from the railway station to its mines. It is said that the guards were attacked by a party of union men. Later, on the same day, a deputy sheriff was killed by one of the guards. For a long time past the mines in question have refused to pay the union wage scale, and have employed guards to protect their non-union workmen.—It is reported that a contest between the Steel Corporation and organized labor will take place next summer, at the expiration of the wage agreement in certain branches of the industry. The tin plate and sheet mills, it is said, are making great quantities of their products and storing more than half their output. Some think they are thus preparing for a labor controversy that may close the mills for a time. The Corporation's tube works in Pittsburg, where a strike followed a refusal to sign the union scale, have now obtained a full force of non-union men.—Eight months after the offenses were committed, nine union teamsters have now been convicted upon the charge that they injured the business of trucking firms during last year's strike of teamsters and hack-drivers in New Haven. Their punishment is three months in jail. This was the strike in which Yale students took the drivers'

places for a time.—At Bloomington, Ill., nine persons have been indicted on account of their connection with the recent street railway strike, and one for issuing a circular calling for a boycott of the cars.—The union of servant girls organized in Holyoke, Mass., last year, has ceased to exist. Householders would not submit to its demands for shorter hours and higher wages. Many members withdrew, and the union disbanded.—An injunction granted in Boston last week by Judge Loring, of the Supreme Court, is said to be the first by which unions have been enjoined from paying strike benefits. The book and job printers are on strike for a new wage schedule. This injunction restrains the pressmen's union from causing a sympathetic strike of pressmen, and forbids four unions to pay strike benefits to persons who quit work out of sympathy for the strikers, without having any personal grievance against their employers.—In Cincinnati, Judge Hosea has made permanent a temporary injunction forbidding the local plumbers' union and Building Trades Council to interfere with the workmen of employing plumbers by patrolling, intimidation, or persuasion. The court holds that these organizations, altho not incorporated, are subject to injunction, and that every member individually is enjoined in perpetuity.

The Islands

At Vigan, on the western coast of Northern Luzon, 24 members of the Philippine constabulary (a part of the garrison of 91 men) deserted, last week, seized rifles and the commissary funds, liberated a dozen jail prisoners, and took to the woods, after a brief and bloodless collision with persons who sought to restrain them. They were joined by about one hundred natives, who grasped this opportunity to become outlaws. Eight of the deserters returned on the following day, but the remainder of the party sought refuge in the mountains, after robbing the people of several villages. At last reports, several of the fugitives had been caught, and those still at liberty were hard pressed by pursuing constabulary, scouts and cavalry. No sign of similar disloyalty has been seen in any other of the native garrisons. The native governors of adjoining provinces at once proffered aid to the Insular Government and asked for permission to raise companies of volunteers. This defection at Vigan was due to the influence of Ricarte, the only living member of Aguinaldo's Government who has not accepted the situation. At the time of General Lawton's funeral he was plotting to cause a general uprising in Manila. He was exiled to Guam. Returning from that island with Mabini, he refused to take the oath of allegiance, and was deported to Hong Kong. Coming back secretly to Luzon, he recently sought to cause an insurrection in the northern provinces, and is believed to be at present in the neighborhood of Vigan.—The President has offered the vacant place in the Philippine Commission to W. Cameron Forbes, of Boston, a graduate of Harvard ('92), who has a large fortune and has coached the University football elevens. Mr. Forbes is an expert polo player, resides on a fine estate near Boston, and has a ranch in Wyoming.—The authorized five per cent. Cuban loan of $35,000,000 has been taken by Speyer & Co., of New York, at 90½. A part of the guaranty is 15 per cent. of the customs receipts. The money thus borrowed is to be used in paying the claims of the soldiers of the revolutionary army.—President Gompers, of the Federation of Labor, has gone to Porto Rico, his purpose being to organize the workingmen of the island in order, he says, that they may "enter into fuller enjoyment of the proceeds of their labor."

Mr. Hay Limits the War's Area

The war between Russia and Japan has given to Secretary Hay an opportunity to add another to his list of diplomatic triumphs. On the 6th, the German Ambassador at Washington, under instructions from Berlin, suggested to the President that the United States, as the Power possessing the least political interest in European and Far Eastern affairs, should urge Russia and Japan to respect the neutrality of China and limit the area of war. After preliminary exchanges of views with European Governments, the State

Department, on the 10th, sent the following instructions to its representatives at St. Petersburg, Tokyo and Pekin:

"You will express to the Minister for Foreign Affairs the earnest desire of the Government of the United States that in the course of the military operations which have arisen between Russia and Japan, the neutrality of China and in all practicable ways her administrative entity shall be respected by both parties, and that the area of hostilities shall be localized and limited as much as possible, so that undue excitement and disturbance of the Chinese people may be prevented, and the least possible loss to the commerce and peaceful intercourse of the world may be occasioned."

At the same time our Government informed all the Powers signatory of the protocol at Pekin of its action, and requested similar action on their part. Germany, of course, responded promptly. Great Britain received the proposition favorably, but inquired as to the scope of the suggested action. There was some curiosity as to the meaning of "administrative entity," a term which, it appears, was purposely used because of its vagueness, in order that none of the Powers should be repelled by a requirement strictly defined. Mr. Hay explained that only moral force was contemplated. One design, it is said, was to keep China out of the fight and to prevent such an anti-foreign uprising in China as would probably follow an invasion of her territory (outside of Manchuria) by either of the two combatants. On the 13th, France sent a favorable reply, having ascertained that Russia would not object to such action on her part. It was expected at last reports that Russia would soon accept the suggestion. Manchuria is not included in the area to be excluded, because it is now the scene of hostilities. Japan welcomed the proposition, but conditioned her acceptance of it upon the action of Russia. She published a declaration, saying that the belligerents were morally bound to reduce the area of war to a minimum; that the war ought to be confined to Russia and herself; that it was of the utmost importance that order should be preserved throughout the interior of China and at the treaty ports; and that she had urged China to observe neutrality scrupulously, maintain order, keep strong garrisons at strategic points, and exclude war from all her territory except Manchuria. Under these conditions she agreed to respect China's neutrality. The Powers will now consider plans for carrying out the suggestion of Mr. Hay's note. It is thought that an exchange of notes will be sufficient and that no treaty will be required. On the 11th our Government issued its proclamation of neutrality.

The Outbreak of the War

Without a formal declaration of war, Japan acted at once in accordance with her intentions as conveyed to the Czar by her Minister at St. Petersburg, and took such measures as she thought necessary to protect her interests on the continent. The next day, February 7th, Masanpho, the port in Korea nearest to Japan, was seized and is now held by a strong force and being fortified. This establishes at the very beginning the main object of the Japanese, which was to secure a naval and military base on the mainland, and they will not be easily dislodged, even in the event of defeat, from this position, so important to them because it gives them control of both sides of the strait which separates Korea from Japan, and connects the two Russian naval bases of Vladivostok and Port Arthur. The following day, Monday, February 8th, a Japanese fleet of five war ships, seven torpedo boats, seven second class cruisers and three transports entered the harbor at Chemulpo, the most important port on the opposite side of the Korean peninsula. There were three Russian vessels in the harbor, the cruiser "Variag," the gunboat "Korietz" and a transport, the "Sungari," and, according to Japanese reports, the first shot of the war was fired on Monday afternoon by one of the Russian vessels. The Japanese troops to the number of 2,500 were landed during the night and the Russian ships were ordered to leave the port at noon. At the appointed time the "Variag" and "Korietz" emerged from the narrow mouth of the harbor, and was attacked by the Japanese fleet in the same manner as Cervera's at Santiago. After an hour's fighting, both ships, badly injured and on fire, re-entered the harbor, where the "Korietz" was blown up by the Russians after the transfer of its men, and at five o'clock the "Variag" sank.

All observers agree in praising the courage of the Russians in this hopeless fight against great odds, but their marksmanship is said to have been very poor, and no material damage was done to the Japanese vessels. The survivors of the three vessels were taken on board the British, French and Italian war ships, and will be kept at Shanghai until the close of the war. Rear-Admiral Sotokichi Uriu, who commanded the Japanese fleet in this battle, is a graduate of the Annapolis Naval Academy, class of '81, and his wife, a Japanese, was graduated at Vassar.—The Japanese troops disembarked at Chemulpo to the number of at least 19,000 and proceeded at once to Seoul, which is now in their hands. They have encountered the Russians at the Yalu River, where it appears they met with some loss in an attack on the Russian outposts.—The Russian Minister to Korea, Mr. Pavoff, and the other Russians resident in Seoul withdrew in safety when the Japanese occupied the city. The Japanese at Port Arthur are still detained for military reasons and the United States has been asked by Japan to secure their release.—Formal declarations of war were issued by both Governments on February 10th, and other nations have issued proclamations of neutrality.

Map of the Seat of War

The Attack at Port Arthur

Almost simultaneously with the occupation of the Korean peninsula, the Japanese fleet, which left Saseho on the 6th, engaged the Russian fleet at Port Arthur at the southern end of the Liao-Tong peninsula, which guards the way to Pekin. The main part of the Russian fleet was stationed here and apparently was not prepared or even keeping a good watch, when, at midnight of February 8th, the Japanese torpedo boats began their attack. Part of the Russian ships were outside the harbor and suffered severely. Two war ships, the "Tsarevitch" and the "Retvizan," and one cruiser, the "Pallada," were damaged and had to be run aground to keep them from sinking. The following noon the Japanese fleet again approached under the guns of the fort and after a bombardment of fleet and fort for an hour again retired. None of the Japanese vessels was disabled, so far as known, and their only loss was four men killed and 54 wounded. The Russian Viceroy, Admiral

Alexieff, reports twelve men killed and fifty-seven wounded on the Russian side. The battle ship "Poltava" and the cruisers "Diana," "Novik" and "Askold" were injured. It is not known definitely how seriously the Russian fleet has been disabled, but according to Admiral Alexieff's report the "Pallada" and the "Novik" cannot be repaired for at least a fortnight, and he does not venture to say when the battle ships will be ready for use again. The "Retvizan" and "Tsarevitch" are the finest battle ships in the Russian service and more powerful than any now in the American navy. The "Retvizan"' is 374 feet long, carries 750 men and was built by the Cramps at Philadelphia in 1901. On her trial trip she made over 18 knots per hour for twelve consecutive hours. The "Tsarevitch" was built in France the same year and is larger and equally fast. This victory makes the Japanese fleet more nearly the equal of the Russian at present in the Pacific. The "Diana" is said to have been injured by a shot from the Russian shore batteries, and the torpedo transport "Yenisei" was blown up by a mine, which it accidentally struck while placing the mines in the harbor.—The British steamer "Fu Ping" was fired upon by the Russians while leaving Port Arthur, and the American steamer "Pleiades," which sailed from Seattle February 2d with a cargo of flour, was not allowed to leave Port Arthur; a detention for which the State Department has asked an explanation.

The Vladivostok Fleet

The four Russian cruisers in Vladivostok, the "Gromboi," the "Rossia," the "Rurik" and the "Bogatyr," have left that port undefended, cutting their way out through the ice, and are in or near the Tsugarn Strait, which separates the main island of Japan from the island of Yezo on the north. On February 11th they fired upon two small Japanese merchant ships passing from Sakata to Otarn, and sunk one of them, the "Zensho," with all on board. This destruction of an unarmed vessel is claimed by the Japanese to be an outrage, and may lead to reprisals.—It is reported that three of these Russian ships had been torpedoed in Tsugarn Strait, but the report so far lacks confirmation—The "Kasaga" and "Niasin," the cruisers bought from the Argentine Government at Genoa, were met near Singapore by one of the steamers of the Japanese-American line, which transferred to them Japanese officers and crew, and took off the English. The cruisers afterward left Singapore to watch for the Russian volunteer vessels, the "Ekaterinoslav" and "Veronje." The former was captured, but the latter escaped

French Politics

The latest weapon which the Opposition has seized to use against Premier Combes is the proposed purchase by the United States of the rights and plans of the New Panama Canal Company and its anticipated consequences. A strong effort is being made to induce the Government to prevent the transfer and the Nationalist group have interpellated the Government in regard to what measures it proposes to adopt against the "peril of the cession of the canal to a foreign Government." They demand an explanation of:

> "the incident which occurred at Panama and the acts of the New Panama Canal Company, which, thanks to the complaisance or feebleness of the Government, has been able, in negotiating the sale of the canal concession to the United States, to menace with ruin the holders of the bonds of the original company and to injure the prestige of France."

The bill introduced into the United States Senate by Mr. Morgan providing for the annexation of Panama is called a violation of international law and a threat against the independence of all the Southern American Republics. — M. Combes holds that the Government has nothing to do with the matter, as the funds of the Panama Canal Company are private, and his motion to postpone the discussion indefinitely was carried by his usual majority.—General Reyes, the newly elected President of Colombia, has gone to Paris for the purpose of preventing the transfer of the Canal to the United States.—A new danger threatens the Combes Cabinet in the difference of opinion which has appeared between M. Pelletan, Minister of Marine, who strongly favors the purchase of railroads

by the State, and M. Rouvier, Minister of Finance, who opposes it. Those who are opposed to the purchase claim that the incompetency and corruption shown in the conduct of national departments prove that the Government is incapable of managing railroads as well as do private corporations. The two railroads which it is proposed to take under Governmental management are the *Chemin de Fer de l'Ouest* (Western railroad) and *Chemin de Fer du Midi* (Southern railroad). M. Combes declares the question of minor importance, which will not necessitate the resignation of any member of the Cabinet.

German Church Federation

It has been officially announced that the majority of the Protestant State Churches have given at least provisional consent to the organization of a Church Federation of the forty-eight Protestant State Churches that now exist in the Fatherland and that are in no way organically connected. This is the consummation of the project originally suggested about two years ago by the Emperor in his famous address in Gotha, and has been accomplished through the activity of the Eisenach Conference, an unofficial but highly influential convention of the representatives of the State Churches that meets biennially in the historic Luther town, and among other excellent achievements has directed the revision of the Luther version of the Scriptures, arranged for a uniform system of pericopes for the entire country, established an archeological school in Jerusalem, etc. The new federation, which now doubtlessly will become a *fait accompli* in the near future, leaves intact the confessional status of the Churches and unites them only in the interests that they have in common. The proposal that the Berlin Consistory shall constitute the Executive Board of the Federation meets with strong objections, especially in conservative circles. It is possibly this determined and well organized aggressive policy of the conservatives that has induced the liberal workers in the State Churches to establish an organization also, something that they had refused to do all along. This step was recently taken at Eisenach by the "Friends of the *Christliche Welt*," the skillfully edited weekly journal that under the direction of Professor Rode, of Marburg, has been successfully making propaganda for strictly modern theological thought amid the educated laity of Germany. It is the outspoken program of this party to win back the educated classes to the Christian Church by advocating a thoroughly modernized type of theological thought. A number of leading theological professors, such as Baumgarten, of Kiel; Gottschuk, of Tübingen; Von Soden, of Berlin; Troeltsch, of Heidelberg, and Johannes Weiss, of Marburg, have agreed to become members of the Executive Committee, the object of which is to give unity and uniformity to the liberal agitation within the Protestant Church of Germany, where the masses are either as a rule strictly conservative or radical. Just at this moment, however, the new departure may encounter unexpected difficulties, as one of the periodic outbreaks of ultra-radical thought, which once every half a dozen years seems to be destined to throw the German Church into a spasm, is now again agitating the heart and the mind of the people. In this case it is an address delivered by Professor Ladenburg, of the University of Breslau, at the recent fiftieth anniversary of the National Society of Naturalists, held in Cassel, in which the speaker, who only a few years ago became a convert from the Jewish faith to that of the Reformed Church, stoutly maintained that the progress of the natural sciences has not only undermined but has overthrown Christianity by demonstrating the non-existence of the supernatural. Even advanced men have seen the necessity of protesting against the radicalism of these views. Among others Professor Deissmann, the leading New Testament philologian of Germany, has addressed an open letter to Ladenburg, found in the *Chronit*, of Leipzig, in which he emphasizes the fact that there are still some things in the Scriptures that modern science has not done away with. The anti-Ladenburg literature is growing to enormous proportions.

Some Lessons of the Japanese Torpedo Attack

BY PARK BENJAMIN

DURING the Civil War the United States ship "Housatonic" was sunk by a Confederate torpedo boat, and the Confederate ram "Albemarle" by Lieutenant Cushing's launch, which carried its explosive on the end of a long spar. Neither attack proved much beyond the heroic courage of the assailants. The crew of the Confederate "David" went down with their boat, and Cushing's almost miraculous escape is historical. The moral effect alone survived. No noteworthy use of the movable mine took place in the Franco-Prussian war of 1871, the Russo-Turkish war of 1877, or the Chinese-French war of 1884, altho in this period the "fish" torpedo, together with the specially contrived and fast torpedo boat from which to project it, rapidly developed.

The first direct test of the modern automobile torpedo against a battle ship took place in the Bay of Valparaiso during the Chilean Revolution of 1891, when the "Blanco Encelada," an armored Congressist vessel, was sunk with her entire crew of 120 men by the Balmacedist torpedo boat "Condell," this after the "Lynch"—consort of the "Condell"—had discharged several torpedoes, which missed their mark.

The second attack was made upon the Brazilian battle ship "Aquidaban" in 1894 during the revolutionary troubles, but is of little importance in view of the wretched defense, and the fact that the assaulting craft fired three torpedoes at ranges of 100 and 75 yards, and only succeeded in hitting the "Aquidaban" (280 feet long) at a distance of 150 feet.

The third and far more important effort occurred in the harbor of Wei-Hai-Wai almost exactly nine years ago, when a Chinese squadron, protected by a double line of submarine mines and other obstructions, was bottled by the Japanese fleet under Admiral Ito. Two successive attempts to send in torpedo boats failed through the alertness and energetic fire of the Chinese. On the third occasion seven boats effected an entrance, and the battle ship "Ting Yuen" was promptly sunk. But, of the assailants, one was torn to pieces by a well placed shell, three went aground, two smashed their propellers on the rocks and the survivor rejoined the fleet unharmed, but with her captain frozen to death in his conning tower. The undaunted Japs attacked again on the following night, and sent three Chinese ships to the bottom.

From that time to this no navy has more persistently devoted itself to the offensive uses of the self propelling torpedo than that of Japan. Its drills have been constant. Its torpedo craft are of the best—if not the best—in the world. It has bought them from such builders as Thorneycroft, Yarrow and Schichau—sometimes in pieces, which were put together in its own establishments. A large number have been designed and built wholly in Japan. It has boats which can make 31 knots per hour. It has eighty-six of them of all classes, with eighteen more building. They are fitted with from three to six torpedo tubes each. The practice maneuvers for years have taken place often with the entire Japanese fleet mobilized, and during these every kind of torpedo attack has been rehearsed again and again with Oriental minuteness. Over all a rigid censorship has been maintained, whereby, despite lynx-eyed naval attachés and the keen watchfulness of newspaper correspondents, Japan has kept her secrets to herself, and merely let it be known that the efficiency of the torpedo flotilla has been keyed up to the last limit and would be kept there.

When the Spanish War broke out in 1898, altho we were well aware of what Japan was doing with her torpedo vessels, we took just the opposite course. On March 24th Secretary Long sent to the Commander-in-Chief of the North Atlantic fleet a memorandum "based largely on certain suggestions made by

Harbor of Port Arthur. The action took place just outside the entrance, at the right of the picture. by the sunken

Captain Mahan," which showed " what the Department expects of the officers in command of . . . torpedo boats." This is what was expected:

" The prime object of their (torpedo boats) being would be to prevent the egress of torpedo boats . . . . Their duty is at all hazards to prevent the possibility of an attack of an enemy's torpedo boats upon the battle ships and squadron. . . . The Department would again repeat, however, that the captains of the inshore squadrons must understand that their duty is at all hazard to prevent hostile torpedo boats getting by them."

There is not one word in that remarkable memorandum directly ordering the torpedo boats to go in and destroy the enemy's ships, and not one word to indicate that the duty urged upon their commanders is other than to wait outside for the enemy to come out. Thus apparently for the first time in the history of torpedo warfare the world was invited by Captain Mahan and Secretary John D. Long to contemplate swift torpedo craft solely in the guise, not of offensive, but defensive weapons.

Then followed the oft repeated cautions not to risk battle ships. Whatever justification there may have been for that prohibition as to large vessels, it is not clear why it should have been applied to torpedo boats. That there were men eager to take them into Santiago and destroy Cervera's cruisers is well known, but the " strategy " which sent Sampson to Porto Rico did not include movements of that kind. Torpedo boat raids were relegated solely to the enemy. " The torpedo boat," writes Captain Clark, detailing the famous voyage of the " Oregon," " was a rattlesnake to me, that I feared would get in his work while I was fighting the tiger." And the crews of the blockading vessels off Santiago watched nightly for the outcoming of the " Pluton " and " Furor." " It is in this danger," remarks Captain Mahan, " in its anxiety even more than its actuality—in its moral effect—that the naval profession recognizes one of the greatest difficulties of a modern blockade." So our torpedo boats continued to wait outside and incidentally peacefully to carry the mail, and if the Spaniards were as anxious about them as we were about theirs, perhaps they did good. Admiral Sampson at times yielded to a certain sense of dry humor —a quality the presence of which in him was seldom suspected—and never did so more completely than in his reported remark, made after the war:

" The non-employment of the torpedo may set it back in naval estimation, but this would be illogical, since the torpedo is really in the same position now as before war was declared."

It is not the writer's purpose to question the American judgment, which converted torpedo boats whether into battle ship protectors or alleviators of nervous anxiety, and so kept them out of harbors; but merely to contrast it with Asiatic judgment, which sent and now sends them in to attack sheltered ships, and the effect of which is now prominently before us. Thus it may be noted that the art of torpedo warfare presents the striking anomaly of having its first principles demonstrated by the Japanese in 1895, reversed by ourselves in 1898, and redemonstrated by the Japanese in 1904.

The narrow passage through which a battle ship is shown as steaming appears to have been blocked Russian vessels.

Exactly how the Japanese torpedo attack was made seems still to be somewhat in question. The Russians, however, have been maintaining a certain formation—three lines of ships in the harbor behind the so-called "Tiger's Tail"—with two battle ships and a cruiser on guard just outside. As the "Czarevitch," "Retvisan" and "Pallada" answer this last description, it is altogether probable that they were suddenly pounced upon by the Japanese torpedo boats, which restricted their attention to them without endeavoring to get at the vessels in the inner harbor. But that they should have been caught unprepared—and all accounts so indicate—is most astounding. If we did not teach any one how to use torpedo boats offensively in our war, we certainly provided the world with elaborate information how to guard against them. The reports of neglect may not be true—and for the credit of the Russian navy it is to be hoped they are not—but if they are *pour encourager les autres* somebody's existence ought to terminate.

The torpedoes used by the Japanese were of the Whitehead type. The inclosing case is of thin steel in the form of a huge cigar, about 15 feet long by 18 inches in diameter, rather blunt or rounded at the forward end. At the very extremity is the primer, which may be caused to explode by percussion when the "fish" strikes its mark, and so to ignite the mass of 200 pounds of gun cotton which is packed immediately behind. Abaft the explosive is a strong steel chamber containing air compressed to 1,500 pounds per square inch, and this escaping under control furnishes the motive power for the propellers which drive the machine through the water. The most wonderfully ingenious thing about it is the gyroscopic controlling device for the rudder, which with more than human certainty not only accurately keeps the torpedo pointed at the target, but promptly corrects any accidental deviation. This is one of the few great inventions made by the naval officers of the United States, and the credit of it is due to Rear-Admiral John Adams Howell—now retired—altho by a not uncommon fate, it is better known by the name of the engineer (Obry) who merely adapted it than by that of its actual inventor.

The torpedo is ejected from a pivoted tube, of which there are usually three on the deck of the torpedo boat, the driving mechanism being set in motion at the instant of discharge. It dives into the water like a porpoise, adjusts itself to the desired depth, and then at a speed of thirty miles an hour goes straight at its prey. Its effective range at the present time is about fifteen hundred yards, but experiments in our own navy have proved that torpedo boats can creep as near as four hundred yards to a ship before being revealed by searchlights. After the torpedo has once started, there is no known defense which an attacked vessel can interpose. Nets have been long obsolete; and, in fact, cannot be used when a ship is under way. The only possible safeguard other than the attacked vessel's quick fire guns, which, of course, assumes a discovery of the advancing torpedo boats, is a cordon of

torpedo boat destroyers maintained around a battle ship at such a distance as will enable them to drive off or destroy the torpedo boats before these can launch their torpedoes. Ships actually in harbors have resorted to the ancient method of a heavy chain drawn across the waterway, as Cervera did in Santiago, but this will only be effective against light torpedo boats, so that it would be necessary merely to send a heavier vessel against it in the beginning to break it down and open a free passage for them. Modern torpedo progress is chiefly in the direction of increasing the effective range, and it is believed at the present time that before long this will be augmented to something over two miles. In this case the difficulties of defense by ships in open water will be greatly increased. The late John Ericsson always maintained that "a battle ship is nothing but torpedo food," and in most things he was wiser than others.

Russian cruiser "Variag"

The reports of the other naval actions between the Japanese and Russians have been so contrary that it is difficult to determine exactly what has happened. It appears, however, that in a second attack on the Russian vessels in Port Arthur the Japanese have seriously injured one battle ship and three cruisers, while at Chemulpo they have destroyed the fine cruiser "Variag" and a gun boat. This, altho an astonishing showing for the beginning of the war, simply indicates that the whole subject of offensive attack had been elaborately studied and worked out before hostilities began. No more impressive argument in support of a general staff for the navy has ever been adduced. The Japanese have such a general staff and have had it for some years. Its functions are not different from those which it is proposed our own staff shall have. It has controlled and prescribed all the maneuvers to which allusion has here been made. It has determined the character of the ships, how they shall be built, where obtained; and, on the whole, the Japanese Navy as it stands to-day is the product and outcome of the established general staff. It is as well to remember that we have nothing of that kind, and in the event of war we should be as we were before, depending upon some organization hastily contrived to meet the emergency. If it happens to be as cautious a one as we were blessed with during the Spanish War it is certain that we should never repeat the brilliant tactics of the Japanese.

A fighting personnel controlled by the nervous anxieties of the Navy Department's selected "strategist" is not likely to astonish the world by its dash—whatever else it may do.

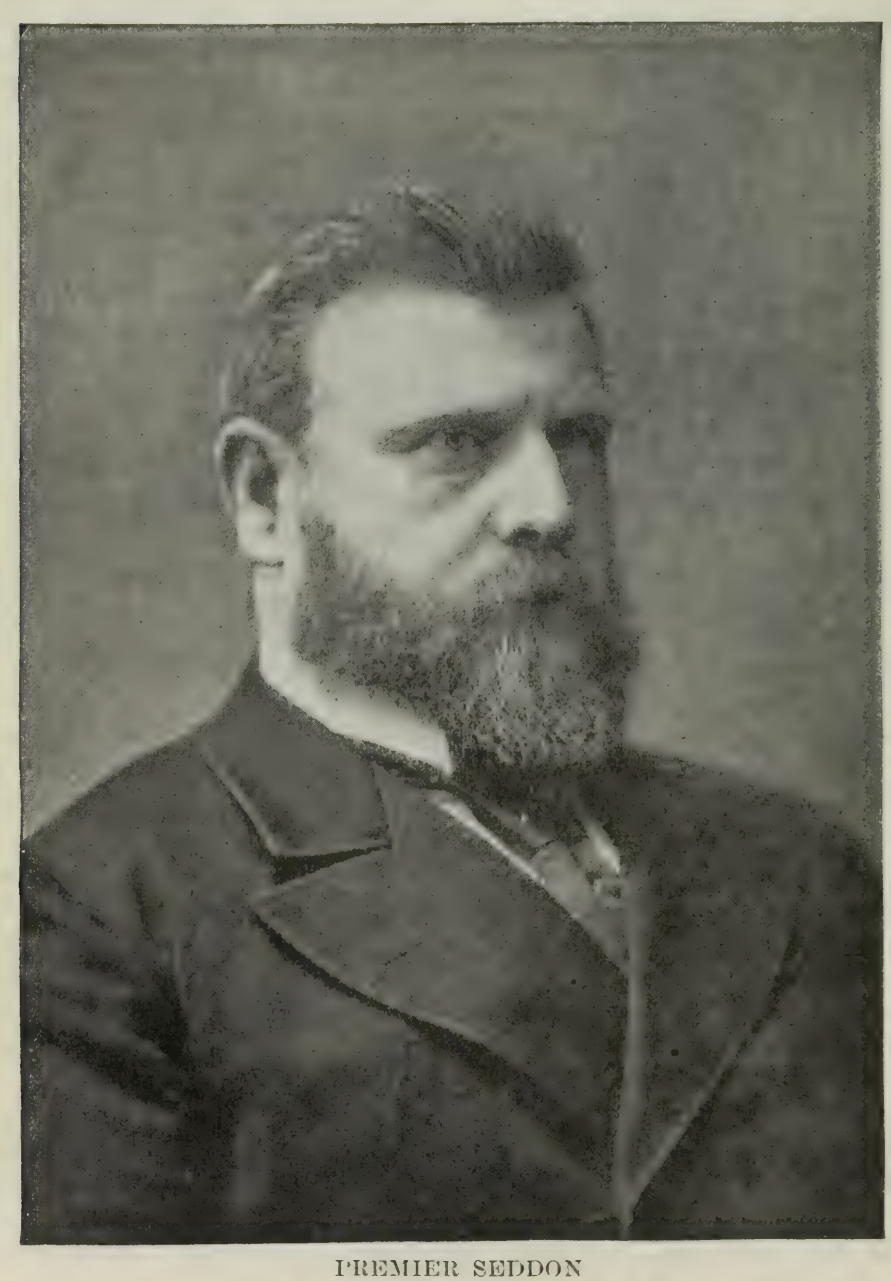
I cannot end this article better than by quoting from a letter, which has reached me since the last lines were written, from a naval officer whose reputation for gallantry and bravery is second to none. He says:

"While off Santiago I begged Sampson to force the harbor, and he replied that he had positive orders from the Navy Department not to risk a battle ship. I said: 'You will not be risking one. The only danger would be from the mines, and if you take off your searchlights and send in the gun boats, the Spaniards will explode the mines and leave safe passage for the fighting ships to enter, as any of the gun boats, if blown up, would still be able to get clear of the channel.' But his orders from Washington were so positive that he would not take the chances."

New York City.

Arbitration in New Zealand

BY THE RT. HON. RICHARD JOHN SEDDON, P.C., M.H.R., LL.D.



[The Premier of New Zealand, who contributes the following noteworthy article, has had one of the most remarkable careers of any living statesman. Born of sturdy Lancashire stock, he emigrated from England in 1863 to Victoria, when eighteen years of age. Shortly after the gold fields of New Zealand offered him chances for fortune, and he went there and became a miner. He was so successful that he was shortly able to become the head of a prosperous mercantile business, from which he stepped easily into social reform and politics. He was soon elected Mayor of Kamura, and in 1879 a member of Parliament. Since then he is the only member who has had continuous service, and has held most all the important parliamentary offices. He is an ultra-democrat, a true champion of the workingman, whether on the farm or in the shop, and since 1893 has been the head of the Liberal party. It is unquestionably a fact that Mr. Seddon is the strongest man in Australasia, and when he attended the Queen's Jubilee he towered among the Australian Premiers, and they were all notable men. As the late Henry Demarest Lloyd has said, "There can be no doubt that the personality of Mr. Seddon has been a factor of incalculable importance in the achievements with which New Zealand to-day challenges the attention of the world."—EDITOR.]

TO the present generation the economic aspect of human affairs bulks so largely that there seems little need for excuse on the part of any one who approaches a national question from that standpoint. In days when even threatened great wars are controlled in their beginnings, or if commenced, affected largely in their continuance, by the exigencies of finance, scorn is not now poured upon those who advocate looking on the progress of society from the "breeches pocket" point of view. If, then, this is true, even about such matters as foreign policies, it is still more directly apparent in the field of industrial competition, and anything affecting the money power, especially the internal circulation of money from capital to labor and back again, is deserving serious consideration. The importance of the subject is the excuse for persistence in advocating what is believed to be right when dealing with issues so large.

It has been the lot of New Zealand to serve as an experimental workshop, in which fresh ideas have been given outward shape and new models tested in the direction of economic legislation. Resumption of Landed Estates by. the Crown, Old Age Pensions, Advances of Cheap Money to Farmers, Graduated Land and Income Tax, Conciliation and Arbitration in Industrial Affairs, Compensation to Workmen for Accidents, Government Insurance for Life, Accident and Fire, State Coal Mines, State Railways, and many other schemes called "visionary" elsewhere, are in this colony in full and successful action. In America the greatest interest has centered in the (so-called) "Compulsory Arbitration Act," and while it has found in the States many warm friends it has aroused a host of enemies. These latter persons are, I think, under misapprehension, both as to the effects of the Act on "liberty" and on the industries to which its provisions are applied. I shall not, however, go over the ground with arguments which are becoming hackneyed, nor endeavor to persuade people to adopt measures for their own advantage. I merely wish to present my view of some amended legislation affecting Industrial Arbitration passed in the Parliamentary Session just concluded.

It was found necessary to pass a short Emergency Act enabling the election of deputies for members of the Arbitration Court unable, through illness or other cause, to perform their duties. This was a mere machinery measure and needs no comment. The main amending Act introduced some important changes. The law had hitherto been that awards of the Court, Industrial Agreements, etc., were confined to the industrial district in which they were issued, but it was discovered that friction arose through unequal competition. An employer, bound by an award to pay certain high wages to his workpeople, found his business in-

vaded by agents of a firm located in another industrial district in which there was no award for that particular trade, and he suffered in consequence. The amending Act gives power to the Court to extend its award outside one industrial district to another if goods are used in inter-district competition. The next important section relates to combinations of employers or workers for the purpose of strikes or lockouts. There was no direct provision in the original Act to penalize strikes or lockouts if they did not take place while the case was under consideration by the Conciliation Board or Arbitration Court. It was, however, held by the President of the Court that, the spirit of the Act being to prevent strikes and lockouts, he had power (under a section which enables him to pronounce what is or is not a breach of award) to punish any combination for that purpose. This was safe enough ground while the Supreme Court Judge, at that time President of the Arbitration Court, remained in office (he has since retired), but it was thought desirable to make the position plain in the letter as well as in the spirit of the Act. Therefore, a clause was passed which made any combination or agreement to defeat an award a breach of award—and this relates to individual workers or employers as well as to unions or associations. Such a measure, at first sight, appears drastic, but it in no way interferes with the industrial liberty of the subject. An employer can discharge his man or a worker leave his master's service if either has the wish to do so. What is provided by the Act is that a certain action which may be innocuous as performed by the individual is to be considered illegal when concerted or agreement made thereon by a number of persons. Following this appears a section which prevents any worker being discharged merely on account of his (or her) belonging to a trade union or being entitled to the benefit of an award. An employer is perfectly at liberty to discharge because he has not business enough or because he has some cause to dislike the worker, but not for unionist or award benefit reasons. Inspectors of Factories and Inspectors of Mines are appointed to see that the Arbitration Awards are carried out.

PREMIER SEDDON

In making brief comment on the above condensed account of the new legislation

in the colony I should like to emphasize the absolute necessity of continual amendments in industrial legislation. It appears to me that there can be neither fixity nor finality in any law dealing with a thing so variable and fluid as production and distribution. The beneficial rule of to-day may be the oppressive yoke of to-morrow, and it is necessary to be ever alert to perceive and anticipate the direction in which economic pressure will be directed. At present the most useful effort appears to be in the exercise of a just discrimination between benignant and malignant combinations. With one hand we have to nourish those organizations of employers and of workers which allow industrial subjects to be grasped in a large and comprehensive manner; with the other we have to strike discouraging blows at combinations which are little better than bodies of conspirators banded to defeat the law and destroy the orderly arrangements of society. It may be difficult to discriminate, and to divide the just from the unjust, but we can at least distinguish between those whose work makes for peace and those who openly defy the law, recognizing no welfare but their own.

It may be that we New Zealanders, whose light skiff is anchored out in the distant ocean far away from the roaring tides which pour through the centers of the world's commerce, may be able to feel the first blow and influence of currents of tendency which have not yet developed power to reach the industrial markets of the United States. Believing that to be the case, I have here endeavored to send you word of the direction in which the bow of our skiff is pointing, in order that you may be aware of the tendency and prepare for the force behind it.

WELLINGTON, NEW ZEALAND.

Education in the United States

BY ALFRED MOSELY, C.M.G.

[Mr. Mosely's Educational Commission, like his commission for the investigation of trade conditions in the United States, is entirely unofficial, for the purpose of enabling Englishmen of influence and ability to see for themselves the methods and institutions of our country, and each individual reports what he has observed in his own way, instead of being compelled to unite with all the others in a single and necessarily compromise report. We discussed the conclusions of some members of the Commission in an editorial published January 28th.—EDITOR.]

IN the course of many visits to the United States, including that of last year, when I took across the ocean a large party of English experts in education to study and inspect the aims and methods of the schools and colleges there, I have been impressed with many things in regard to education, but with none more than the general attitude adopted toward it by the people as a whole. Everywhere I went I found the same firm belief in the value and importance of education as the dominant factor in the moral and material progress of the country, and in every class there was the same determination that the children, at any cost, should benefit to the full from the advantages it is able to confer.

Evidences of this mental attitude I noted in every direction. To begin with those whom in England we call the ratepayers, they seemed to grudge no money to make the buildings and equipment of the schools as adequate for their purposes as possible. The amount spent per pupil in accommodation alone would horrify many people on this side of the Atlantic, and I came across instances in which communities were devoting more than half their available income to the provision of proper schools. When Germany settles a new station in one of her colonies, it is said that her first care is

to establish a full and complete staff of Government officials, with an equally full and complete range of Government buildings for their use, even tho the population that is to be governed is practically non-existent. In America, when a new town springs up on the prairie, the first care of its inhabitants seems to be to provide adequate facilities for the education of their children. In Oklahoma, for instance, some of my delegates noted with admiration that, altho that magnificent territory has barely entered its 'teens as a settled area, a complete educational system, with common schools, training school for teachers, etc., right up to a university, is already in full operation. There is this difference, however, in the American new town as compared with the German colony, that the population to be schooled, even if it is absent just at the beginning, is not long in making its appearance, for settlers are quickly attracted by such an enlightened policy of supplying proper means for education, tho they would probably think twice before coming if they saw no prospect of their families being able to obtain the instruction that is felt to be every child's right.

As another instance of the way in which the citizens of the United States go into education "bald-headed," to borrow a picturesque expression introduced to English readers by Mr. Lowell in his "Biglow Papers," I was told that, keenly as political opinions are held and traversed, education is kept outside them. The candidate for any public office may adopt almost any platform he pleases without absolutely ruining his chances of success; but if once he gets the reputation of not being a sound believer in education, whatever his views on other matters, he is almost certain to fail. Similarly, religious questions have successfully been excluded from the business of education in America; and the schools have not been allowed to become the battle field of various competing sects. This does not, I am convinced, mean that American parents are careless of the moral and religious welfare of their children, but it does mean an enormous gain to the cause of education, for the energies of those concerned are all directed toward securing efficiency in the schools instead of being frittered away in sectarian jealousies and squabbles as to control, in the midst of which, in England, too often the welfare of the children themselves sinks to a position of quite secondary importance.

Besides acquiescing in the liberal expenditure of public money for the purposes of education, the parents in America, I was glad to note, show their appreciation of its value in a still more personal way, and that is by allowing their children to spend a longer time at school than is the case in England, at any rate among the poorer people. With us a boy may leave school at the age of thirteen in any case, or at twelve if he has attained a certain not very exalted standard of knowledge. In America I understand that out of 30 States (for 19 others there were either no returns available or no legislative enactments in force) thirteen was the leaving age in only one; in 18 attendance was compulsory till the age of fourteen, in 3 till the age of fifteen, and in 8 till the age of sixteen. Even that is not all, for I heard of arrangements by which boys who have attained the leaving age without attaining the proper standard are required to attend evening schools. In England I feel sure that very many boys leave school far too young, and the ultimate reason I believe to be simply that their parents do not think of education as being of much practical value. It is true that owing to the extended system of free education enjoyed in the United States a boy can stay at school to a much later age than in England without entailing any direct drain on his father's pocket. It is also true that the holidays and vacations are arranged on a more sensible plan, so that, in country districts, at least, a boy can go and earn money in the fields by assisting with the harvest, in a way that is impossible here. But these things are comparatively small details and are not of themselves sufficient to explain why, even for the children of poor parents, the time devoted to school education is so much less than in America.

If the expense of school fees was the only explanation, we should long ago have had an agitation for the extention of free education to higher grades

than have it at present, but numerous and excited as are the disputes which cluster round education here, that particular question has not been raised. The reason is rather to be sought in the apathy with which education is too often regarded by parents and children alike. Both look upon it as an unpleasant experience, which is to be got over as quickly and easily as is possible in the circumstances. The parents want the boy to go and do something useful, to begin to earn money for himself; so at 13 he becomes a message boy in some office, or if he belongs to a somewhat richer class, at 15 or 16 he is pitchforked as a junior clerk into some merchant's office at a miserable wage, which, however, is probably more than he is worth. The boy, on his part, is nothing loath. He is anxious to escape from the bondage of school, to go into the world, to be a man; and the pity of it is that at 21 he is less of a man, less matured, less self-reliant, less independent than the American boy of fewer years who has just finished his high school course.

How exactly it has come about that, broadly speaking, education is valued more highly by American boys and girls than by English ones, I am unable to say, but it seems to me an indisputable fact. It is followed by certain consequences. In America children go willingly to school and there does not seem to be much trouble about attendances, which generally reach a higher average, tho I am aware there are exceptions in some of the big cities. Then when the children are in school it reacts on their behavior and discipline. They can, it appears, be trusted to behave properly without the fear of punishment being held over their heads, and to attend to their teachers without the inducement of prizes. These results, I believe, are attributed by some educationalists to the system of teaching boys and girls together in the same classes, even up to the age of eighteen, the argument being that the presence of the girls has a moderating and refining influence on the boys, while that of the boys spurs on the girls to their best endeavors; but I confess that I am somewhat doubtful of this explanation, as, indeed, I am of the advantages, in the long run, of such coeducation. I should prefer to see in the excellent tone and earnestness of American schools rather a sign of the practical self-reliance of the American temperament, and to suppose that the good sense of the pupils leads them to realize that their success in life depends on the good use they make of their opportunities. But, however that may be, there is certainly a great gain to the teachers. Relieved of much of the strain of keeping order, they have all the more energy to devote to their proper business of teaching, and they have a further advantage in the fact that, since they are not under the necessity of directing all their efforts to the final end of securing a verdict of "satisfactory" from some outside examiner, they are free to leave a refractory or idle pupil to his own devices, without needing to waste time in forcing or cajoling him to learn.

This diffused belief in and zeal for education seems to me on a broad view to be the most conspicuous feature of the American educational position at the present time; the people having that, all other things shall be added unto them, and beside it the methods and results of the actual teaching become matters of secondary importance. Of course, it would be foolish to suggest that American schools do not share the same imperfections which attach more or less to every institution upon this earth. The experts of my Commission were often able to say—no doubt with perfect justice—that in this school things were not so well done as in England, or that the work in that one would not have passed muster with an English examiner. But the important point, in my judgment, is not that defects exist, whether to a greater or a less extent than in England, but that every one is alive to the necessity for removing them, for making the poor schools good and the good schools still better. The educational reformer in America is not as one crying in the wilderness, while the rest of the people sit afar off, only awakening from their stolid indifference if by some unfortunate chance his voice forces itself in upon their solitude. Rather everybody is a reformer, determined that the best shall be done that is possible in the circumstances, and ready to spend time and

money in any experiments that seem likely to lead to improvements on existing arrangements.

Altho I regard the purpose of the last visit paid to the United States by myself and my Commission as being to learn the good points, not to look for the weak ones, of the American educational system, I will here venture upon one criticism. I did not like the preponderance of women teachers that seemed almost universal. My objection was not based on my doubt as to the sufficiency of their attainments for the task with which they were charged; on the contrary, I am sure that most of them are highly trained, capable and accomplished teachers. But I cannot think it is a good thing for big boys of fifteen and sixteen to receive most of their training from instructors of the other sex. For young children the case is different. I am quite in favor of women teachers being employed for both girls and boys up to the age of say twelve years, because I believe that women understand the working of the minds of young children and have a faculty of sympathizing with their difficulties and troubles which is possessed by very few men. But for children of more mature years I feel that men can provide better mental and moral discipline. This view I believe is widely held in the United States themselves, and I understand that the employment of women teachers is resorted to because it is a practical necessity rather than because of any fixed conviction of its inherent advantages. In a country where money is lavished so ungrudgingly on education, it is a little surprising to be told in effect that male teachers cannot be afforded. No doubt it is a difficulty that the numberless openings which present themselves to men of ability for making money in business and professional careers entice them away from the teaching profession, but even tho first class men teachers cost more than women teachers of equal skill and ability, I think that more important considerations than those of expense call for their more extended employment. The influence of women teachers combined with that of the coeducation to which I have already referred can scarcely fail, in the long run, to exercise a certain effeminating effect which cannot be for the ultimate advantage of the nation.

The fundamental purpose for which, in my conception, my Commission visited the United States was to investigate how far the industrial success of the country is to be attributed to her educational system. Of course, if she had had no natural resources to develop, all the education in the world could not have made her a great industrial Power, but with that qualification I feel that education has been the most potent factor in her success. This opinion, I am aware, is not universally held, even in America. For example, Professor James, of the Northwestern University, thinks it probable that the American school is a product of the American spirit rather than the American spirit a product of the American school, and I have heard it suggested that the early pioneer spirit which was developed by the task of settling a new country and surmounting the difficulties presented by nature and the red Indian may well be responsible for the success of the United States, apart from education. President Roosevelt again told us that education alone would not make a country, altho a nation that neglected it must in the end be lost. My early experience in South Africa, however, leads me to lay more stress on education and knowledge. The rich mineral resources of that country remained very imperfectly utilized, in spite of many efforts to utilize them, until their development was taken in hand by men —American engineers — who brought to bear upon the problems involved the power which is born of education and scientific knowledge. Similarly I think that America, with all her vast natural wealth, would never have reached her present pitch of prosperity had not her people been universally infused with the conviction—of which her present highly organized and elaborate educational system is the natural outcome—that knowledge is power, and that without the knowledge how to use them the finest endowments, mental and material, avail nothing.

I was, therefore, specially interested in a statement made by President Nicholas Murray Butler, of Columbia University. According to him, where in the United States the public school term is longest,

there the average productive capacity is greatest. In 1897, he says, the average school period in the United States was 4.3 years, while in Massachusetts it was 7 years. The ratio thus was 43 to 70. Now, at the same time, it was found that the ratio between the productive capacity of each individual in the United States as compared with that for each individual in Massachusetts was practically the same —37 to 66—and he adds that on the basis of 306 working days a year, with a population just over two millions, every citizen of Massachusetts is to be credited with a productive capacity of nearly 89 dollars a year more than the average of the United States as a whole.

My confidence in the correctness of my view was strengthened by the fact that in practice I found it was shared by those responsible for the management of the big manufacturing and industrial concerns, even tho they had not perhaps enjoyed the advantages of a really good education themselves. At places like the Baldwin Locomotive Works, the National Cash Register Works at Dayton, the General Electric Company's works, the Pennsylvania Railway works at Altoona, I found that the managers had no use for men who had not been through a trade or technical school. In England the managers of technical and engineering concerns are much less appreciative of the man who has been trained at a technical school or college, and are often disposed to look with more favor on those who have been trained under the apprenticeship system—which, in passing, I may remark in England, as they have in America, the trade unions are doing their best to kill. I am not prepared to say that from their point of view the manufacturers are not right. It may well be that the English college-trained man is not a useful article to them, but if that is the case, it is the fault of the colleges and the kind of instruction they purvey. If their product is worthless for practical work, the whole reason for their existence has gone. I will not attempt to discuss the grounds for this English distrust of technically-trained men as compared with those who have been empirically trained in the shops and picked up their knowledge as best they could from unsystematic experience, more especially as I think it is lessening every day. I will only point to one restriction which is often unwisely imposed in England, and as wisely omitted in America. In an English technical college the professors are frequently required to give their whole time to the teaching duties of their post and are debarred from undertaking outside professional work. The result is apt to be that they lose touch with the practical needs of manufacturing industry and that their instruction takes on an academic tinge which does not make for the efficiency of their pupils in actual industrial work. Far better is the American practice of not merely allowing the professors to take outside work, but even regarding them as something of a failure if they do not get plenty of such work to do.

London, England.

The Color of the Rose

BY MINNA V. GADEN

THE brown mosaic of the field and wood,
Bereft of color where in springtime stood
The blossoming trees, or crept some fair design
Of livelier hue beneath in flower and vine,
Hath for the multitude its rose-tints lost.
The winter meadow by no flower embossed
Is but the grave of some once lovely May;
Its restful reaches where the noon-lights play,
The far-off, faintly purple line of sedge
And taller reed that marks the river's edge,
As tho it were the iridescent ring
Upon the neck of some gray dove in spring,
Are all unknown to him, who in the quest
Of beauty faltereth. The mountain crest
He left ablaze with autumn's dying fires
Lifts yet along the sky its ancient pyres
In opal tints, as softly through the haze
Of the fast lengthening February days
As through November's smoky air it glowed
With all the rainbow's other tints. The road
That led through dim cathedral woods in June
Time-serving worshipers have left too soon.
An angel presence in each season's guise
Bears ever forth, fair to beholding eyes,
The Color of the Rose, as in the tale
Of Arthur's knights, was borne the Holy Grail.

NEW YORK CITY.

George Washington, Southerner

BY WILLIAM GARROTT BROWN

AUTHOR OF "THE LOWER SOUTH IN AMERICAN HISTORY," ETC.

THE biographical element in history is harder to reason about than any other. It yields but little to analysis. We may philosophize with some satisfaction on the material causes of the most widespread tendencies; we may feel that we have explained the characteristics of whole peoples and civilizations. But the individual, particularly when he is one of the marked and chosen, presents far greater difficulties. Still, there is no part of the historian's work more alluring to himself or more fascinating to his readers than his attempts to account for the great men.

One day, about a year ago, the same mail brought me two letters, one from Buffalo and one from New Orleans, which seemed to join in a single invitation, and gave me an excuse for entering upon a line of thought which, tho dangerous, had often tempted me before. The first was a request for a discourse appropriate to Washington's birthday. The second, from a student of Southern history, asked for my opinion on the question, What good qualities, if any, have come out of the civilization of the South to go into the permanent American character? The phrase "George Washington, Southerner," was a quick outcome of my meditations.

How far it is a truthful phrase that is to say, how much his Southern birth and breeding, his associations with other Virginians, his life on a great plantation, his ownership of slaves—how much these things had to do with the character of Washington—is, of course, a question we cannot answer so clearly or confidently as if it were asked of Southerners or Virginians in general. It is like analyzing for his Americanism or his Englishry, when after all he doubtless drew more of his qualities from his mere membership in the human family than from his assignment to any particular branch of it. And, then, there were his entirely personal belongings. Nevertheless, it may be worth our while—particularly the little while we all in some fashion once a year give over to celebrating our national hero—to consider, the vague way we can, both how far he was a Southerner and also what sort of a Southerner he was. The first fork of the inquiry should be a good turn for

those of us whom the English used to call, with a suggestive inaccuracy, "Northern Americans." Southerners, on the other hand, who, when they discuss their own affairs, have a perverse way of preferring their lesser to their greater great men, may more profitably take the other.

We should all agree, no doubt, that if Washington had not been a Southerner, a Virginian—if he had been born in Boston, let us say, or in New York, and of Dutch descent—we should have now a different figure before our minds. But how different? It at once occurs to me that the living man who has reminded me of Washington oftener and more strongly than any other is not a Virginian, or even a Southerner, but the first citizen of New England, and so far as I know with none but New England blood in his veins. The likeness extends to many habits of speech and conduct that might almost be mistaken for family traits. It appears in limitations no less than gifts and powers. No Knickerbocker parallel is at hand, however, and we need not be deterred from our inquiry by the existence of a fairly close one in New England. There were many things in the Virginian's life, and in his character also, which would never have come into either if he and the Adamses had been neighbors at Quincy; and *vice versa*.

For example, he would probably have got more literary training there than could be had in Westmoreland County, and Sparks might not have been led into the particular editorial temptation which the spelling in Washington's writings presented him. More of the days of Washington's boyhood would no doubt have been spent in the schoolroom and fewer in the saddle. Fox-hunting might never have become his passion. On the contrary, the sea would more naturally have lured him while his decidedly adventurous spirit was not yet drawn to pioneering or to arms. It is clear that later on he could not have found, anywhere in New England, so valuable an experience in the personal direction of large enterprises as he got while he served Lord Fairfax, and when he himself became the greatest planter in Virginia. He might have found a widow in New England nearly as rich as the widow Custis, but she would have brought him no establishment comparable to a Southern plantation. The business of such a merchant prince as John Hancock's father was comparable to a planter's in importance, perhaps, but not in the character of the headship it required. Nor could Washington's relations with his neighbors in New England have been what they were in Virginia. Most important of all, he could have been a slave-owner in Massachusetts only on a very small scale; for not even the richest men in that part of the country could afford to invest any considerable part of their wealth in human beings. We know that even in Virginia, the last year of his life, he found that he had twice as many slaves as he could employ with profit. Unless, he said, he should sell the overplus, or find some new way of dealing with them, he would be ruined.

We may be sure, therefore, that much of what was peculiar to the South and to colonial Virginia sank into his character, and that no Englishman, no New England man, no Knickerbocker, could possibly be as like him as another colonial Virginian conceivably might have been. Seeking more particularly for the elements of strength which he took from his environment, we will do best to join him with the other strongest Virginians of his time. While it would be illogical to attribute to their common experiences and associations the characteristics of any particular member of that extraordinary group, it is not unreasonable to suppose that any qualities which the whole group displayed, particularly if they were distinctive qualities, were in some measure due to the civilization out of which these men came. Are there, then, any respects in which we find the leaders of Revolutionary Virginia—Washington and Henry and Jefferson and Mason and Marshall and Madison and the Lees and Randolphs—taken as a group, distinguishable from Revolutionary leaders in general throughout the country?

In this sort of generalizing, and in this space, our reasoning can proceed only by a sort of common consent, each of us modifying the conclusion in pro-

portion to his dissent from the premises.

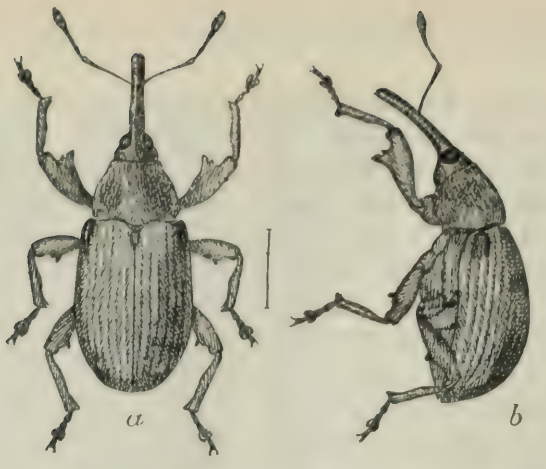
I am inclined to put first a distinction of the Virginians which they got merely by an excess of a quality which nearly all the builders of the American nation displayed. They had more than their share of a certain gravity, a high seriousness, which we expect to find in every Revolutionary worthy. This may seem a surprising statement, since many of us have the impression that Southerners have always been the most light-hearted of Americans. That might be true, however, and leave my assertion untouched, for have not the gravest reformers and rebuilders in history lived in societies where anything but a long face was the fashion? As a matter of fact, light-heartedness never has been characteristic of the stronger men of the South. Whoever on a plantation or in a Southern country town had strength enough to take life seriously at all, found plenty of time and solitude to take it very seriously indeed, and plenty of serious things to consider. Leadership did not go to the merriest squires. Not one of these Virginians excelled in glibness or lightness of touch. They were anything but gay cavaliers. One finds scarcely a single laugh in all their writings and speeches. By contrast, such a man as Samuel Adams, of Massachusetts, gives one a sense of relief. Deliberate and stately, slow of thought and full-resolved in action, the Virginians were, perhaps with the exception of Henry and Jefferson, better men to carry through than to begin a movement.

Behind their gravity of deportment was a singular constancy of sentiment and a provincial intensity of feeling. Of Washington, particularly, it can no longer be doubted that his passional nature was extraordinarily strong. Thanks to saner biography, the coldly correct man whom we once tried vainly to like or to admire has disappeared. He has given place to a man of truly terrific passions, wonderfully controlled. Of all the incidents and anecdotes, none perhaps illustrates better the extent of his self-rule than the story of the officer whom he ordered across the Delaware, and who returned and reported that the river could not be crossed. Instantly Washington hurled at the man's head the heavy inkstand from which he was writing, exclaiming, in a burst of ungovernable fury, "Then go back and send me a man!" In this compelling combination of will and passion he had no rival among his fellows; but all save Madison impress the student of their lives with their capacity for a great and single devotion to causes and to men. My own belief is that in this capacity the Southern planters have always excelled. It is a characteristic of provincials, particularly if they be country-bred.

Along with it there went in these Virginians, who were nearly all well bred and trained in a good school of hospitality, a capacity for cordial personal relationships which was also of great advantage in their public careers. It is generally agreed that their social equipment was superior to that of most men whom they encountered at congresses and conventions and in the army. Their speech was sweeter; their manners easier and more cordial. It is even reasonable to believe that their individual characteristics, their personalities, were more marked and therefore more attractive: that they were, as one says nowadays, more "interesting" than the average colonial statesman and captain. For this is what most travelers in America in that period seem to have found, and it is what a comparison of the great plantation with other American communities would lead us to expect.

These fine qualities were all, in one way or another, sources of power and leadership. Back of them was that which used and informed them all—the habit of leadership, the constant expectation and desire of power. And this was the gift of the slave. Of all the reasons why Washington and his neighbors took the highest places during the Revolution and for several decades thereafter, none was more potent than their being used to so much authority at home; and of all the causes of that habit of their lives, no other was nearly so important as slavery. When Washington took command of

the army at Cambridge, he was surprised to find how little respect the Massachusetts officers got, or seemed even to expect, from the men. He wrote back to Richard Henry Lee that they were, apparently, "mainly of the same *kidney* with the privates." That, evidently, was not the way things were done in Virginia. If we should seek now in America a class comparable to the great slave-owners for naturalness in command, for masterfulness, we should find their closest counterparts in the men who, all over the country, are at the head of the greatest industries,—in the managers of corporate enterprise.



Here, then, were certain qualities in Washington which I think we may attribute in some measure, probably in a great measure, to his being a Southerner, and of the class uppermost in that society. Most of us will think them admirable qualities, and they were all conducive to his rise and eminence. But when we try to estimate the cost of breeding men like him we come upon a darker view of the colonial South; and when we read his own words concerning the Southern question of that day it appears that no one in the country, unless it was Jefferson, saw more clearly than he what was at fault in his own Virginia and on his own plantations.

"I never mean," he wrote to one correspondent, "unless some particular circumstances should compel me to it, to possess another slave by purchase, it being among my first wishes to see some plan adopted by which slavery in this country may be abolished by law." He would not sell the overplus of his own slaves, because he was "principled against this kind of traffic in the human species," nor hire them out, because they could not be disposed in families, and he had an aversion to disperse a family. He heartily supported Lafayette's scheme of colonization. His will gave freedom to his own slaves so soon as his wife's death should free a much larger mass with which some of them had formed family ties.

But his insight went much further than to the mere perception of the moral wrong and the economic unsoundness of slavery. He seems to have seen clearly the immense difficulty of destroying it, and to have been even more discouraged when he approached the question of what should follow its overthrow—that is to say, the question of industrial reconstruction which we had to deal with after the Civil War. On these two problems his views were strikingly like Lincoln's. Discussing in one letter the abolitionist movement among the Quakers, he speaks of "those whose MISFORTUNE it is to have slaves as attendants." Interference between masters and slaves he resented, as he did also all suggestions of compelling emancipation from without. His desire was for gradual emancipation by State legislation, but he foresaw many hardships, and an utterly anomalous place in society, for the freedmen. The minute provisions in his will for the care of the very young, the aged, and the infirm among his own blacks show that, tho an abolitionist, he was by no means deluded into the notion that abolition would prove a solution of the race problem. His constant practice of justice, kindness, and mercy in all his relations with negroes shows better than could any words how he thought individual Southerners could ameliorate a situation which even to-day we have found no means essentially to change.

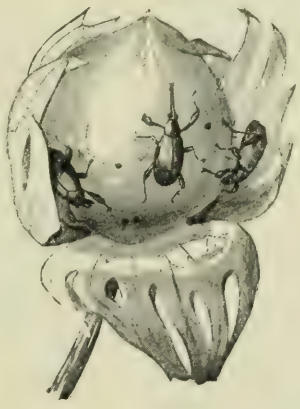
This, in crude brevity, is what we know of Washington, the Southerner: of what Southern civilization did for him, and what he did and would have done for the South. Looking at the matter from both points of view, one feels that no better Southerner has ever lived. It is probably true that with the changes of a century and a half Southern life is now more conducive than it was in his time to strength and competency in the mass of white men, but we may well doubt if the South is so good a nursery of leaders. At any rate, "Back to Washington!" would be no bad motto for the serious-minded, high-purposed men of whom one finds a half-dozen in nearly every Southern community, and in whom is the South's truest leadership and highest hope to-day.

WASHINGTON, D. C.

(a) Back and (b) Side View of the Boll Weevil

The Cotton Boll Weevil Invasion

BY M. J. MUNN



[The following article by the Assistant Topographer of the United States Geological Survey, together with the one by Mr. Penfield which we print in this issue, discuss the two greatest dangers now threatening the cotton industry of America. These articles should be equally valuable to the planter and the cotton speculator.—EDITOR.]

DURING the summer of 1894 planters along the Rio Grande, in Southwestern Texas, discovered in their cotton fields the presence of a small grayish, long-nosed, armor-clad beetle, of about the size of a common house fly, and belonging evidently to the weevil family. The newcomers were observed to be diligently driving their dagger-like beaks into the soft, juicy, half-grown bolls and squares (unopened blooms) of the growing cotton, and afterward methodically depositing an egg in each opening. Squares thus pierced soon withered and fell to the ground, without blooming. If these discarded squares happened to fall upon moist or well-shaded ground, where the sun could not dry them thoroughly, larvæ soon hatched from the deposited eggs. These grew rapidly, and in a few days became pupæ, and thence by another transformation into the full-grown beetle, the transition from egg into weevil taking about four weeks. Half-grown bolls seemed, however, the safest breeding place. These remained upon the stalk, and the soft, juicy interior protected by the leathery burr afforded an ideal feeding place, and were frequently found to be literally alive with the hungry larvæ.

The alarm was at once sounded that another enemy of the cotton plant had appeared. Specimens were sent to the Department of Agriculture for examination. There entomologists recognized the invader as the Anthonomus Grandis, or Mexican "Picudo," commonly known as the Mexican cotton boll weevil. This insect probably came originally from the wild cotton country of Central America. It first invaded Mexico in 1848, and steadily spread northward, year by year, until the Rio Grande was reached in 1894. The entire cotton area of Mexico was infested, with the single exception of the famous Laguna district, which no doubt owes its escape to its high altitude. An elevation of 3,500 feet above sea level doubtless proved too much for an insect native of a low country. Unfortuntely, no cotton producing territory of the United States is nearly so high.

In Mexico no organized fight was made against the weevil. The cultivation of cotton in the infested region was practically abandoned. When the danger signal was raised in Texas the Department of Agriculture found itself totally unprepared for the attack. Aside from a brief scientific classification, entomologists knew absolutely nothing about the insect. Its life history and peculiar habits had never been

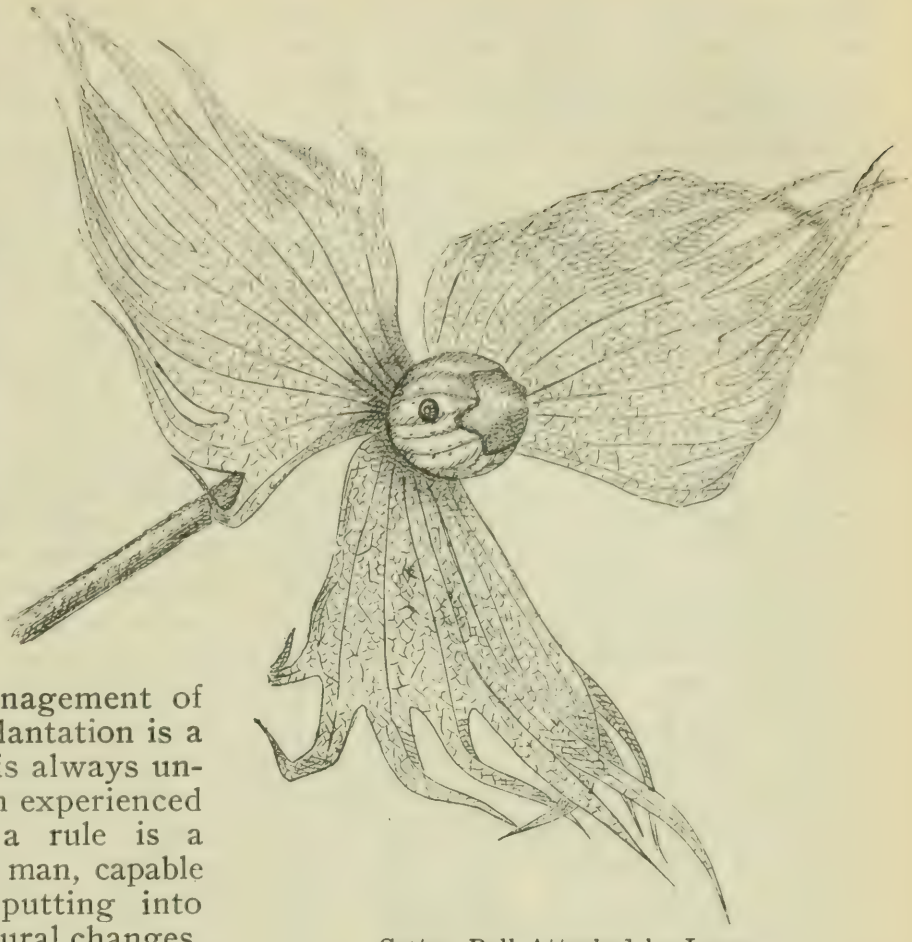
studied by an expert. The importance of adopting heroic measures at this stage of the fight, to prevent a further spread of the weevil, was fully appreciated by no one. From what is now known of the insect, the prohibition of cotton raising within a belt ten miles wide around the infested territory, and along the Rio Grande, together with a strict quarantine against such agricultural products as would be likely to transport weevils, probably would have proven a sufficient barrier against their northward progress. This solution of the problem was first insisted upon by Mr. Townsend, of the Division of Entomology, immediately upon entering the field. The State Legislature, however, failed to take prompt action in the matter, and a further spread of the weevil soon rendered the scheme impractical. The Department of Agriculture promptly responded to the call of the planters for assistance, and detailed a special field agent from the division of entomology to make a careful study of the life history, habits, diseases and natural enemies of the invader, and, if possible, devise means for its extermination. Since that time the fight has been waged relentlessly, tho at no time has the Department had the amount of support from Congress that the seriousness of the case demands. Notwithstanding this drawback, most exhaustive investigations have been made along practical lines, but, so far as stamping out the insect is concerned, without avail.

Late Fall Boll, Showing How Beetles Hide Between Boll and Involucre (From Howard, Dept. of Agriculture.)

The weevil now holds unquestioned sway over one-third of the total cotton acreage of the United States. This territory may safely be said to produce, under normal conditions, forty-five per cent. of the total cotton crop. During the year 1902 a conservative estimate places the loss to Texas alone at between ten and fifteen million dollars. Their toll for 1903 was probably nearer twenty-five millions. Total loss up to date, about one hundred and twenty-five million dollars. In making this estimate, the advance in the price of cotton caused by this cutting off of a large per cent. of the Texas crop has not been taken into account. This factor included would perceptibly decrease the estimate loss. Such, in brief, is the present status of affairs. What the future will bring in the way of relief we have yet to see. Experts are a unit in saying that the weevil is here to stay. Dr. W. D. Hunter, of the Division of Entomology, and an undisputed authority on the subject, in concluding his latest report, says:

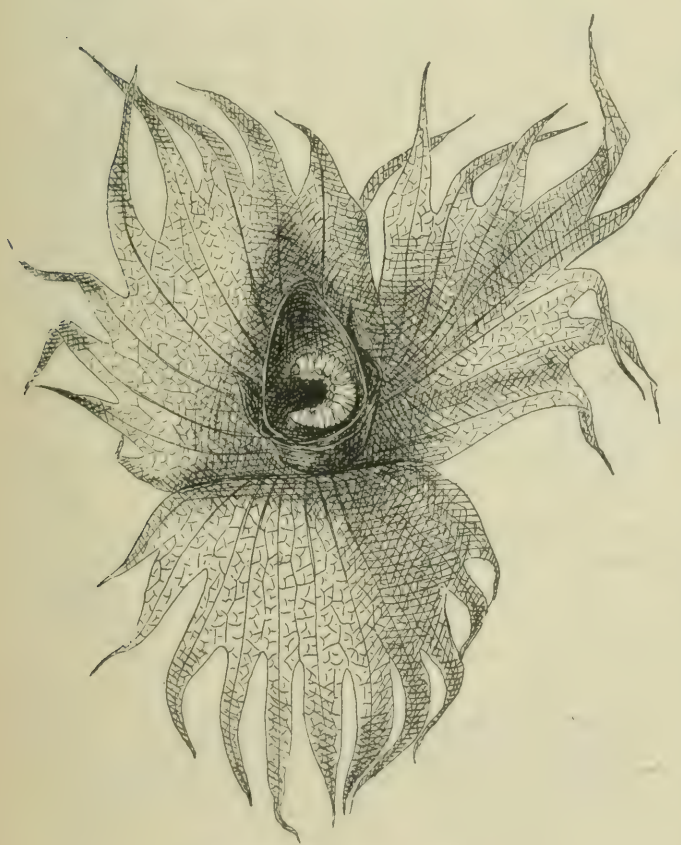
"Two of the most important elements in limiting the spread of an insect—winter temperatures and parasites—in this case offer no assurance that the pest will soon be checked. It has been advancing year by year, and there are influences that seem to make it certain that the area infested will be constantly increased. . . . On the whole, it seems that as the number of pests in a certain region is practically only limited by the quantity of food supply, so the weevil progress will probably eventually be checked only by the limit of the distribution of cotton in the United States. This movement, however, the experience of nearly ten years indicates, will not be rapid, perhaps not more than sixty miles per year. . . . That the boll weevil is to be a permanent factor in cotton culture is a certainty, and that it is to spread outside of Texas is also inevitable. Local conditions may bring about temporary immunity in districts, but the general status will remain the same."

Recognizing these facts, experts and planters alike have of late bent their energies more toward devising means of evading the enemy than fighting it. In this field they have met with better success. Two important facts, peculiar to the insect, give the planter at least a fighting chance. One is, the natural thinning out of the insects by the exposures of winter hibernation; the other, the lack of a suitable breeding place during the spring and early summer. In most of the cotton country the plant rarely puts on squares before the fifteenth of May. Since the weevils feed and lay their eggs only in the squares and growing bolls, and as



(From Howard, Dept. of Agriculture.)
Mature Boll Cut Open at Left, Showing Full-Grown Larva; the One at the Right Not Cut and Showing Feeding Punctures and Oviposition Marks

it also requires four weeks for the development of a brood, the accumulation of a sufficient stock of new weevils to do much damage takes from two to four months, depending upon prevailing climatic conditions. After two broods are hatched the increase is most rapid, and is soon limited only by the supply of bolls. From what is now known, the only chance for the planter is to grow his crop during these days of grace. Experiments made by Mr. Hunter, of the Division of Entomology, along this line have proven most valuable. In brief, his decision is, that early planting, the use of early and quick developing varieties of seeds, wide rows and thorough cultivation will have much to do with profitable cotton raising of the future. It has been demonstrated that on an average two-thirds of a normal crop may be grown in a weevil stricken district, and at but little additional cost, by a careful following of scientific methods. Future experiments may probably cut down this percentage of loss, tho from the very nature of the case this reduction will be a slight one. On a whole, one seems safe in saying that planters of the future in any infested district cannot depend upon more than two-thirds of a normal crop.



The above statement being true, one of two things must happen. Either cotton must advance in price year by year at such a rate as to cover at least a large per cent. of this loss, or else the growing of cotton over a vast area of the South must be abandoned. It now seems probable that the former will be the case, tho this is by no means certain; conditions could easily arise in the financial world that would bar this simple solution of the problem.

A careful study of the cotton growing area of the United States reveals the fact that perhaps one-half of it lies within what is known as the "Pine" belt. This loose, sandy loam, upland country, tho only of average fertility, is especially adapted to cotton raising. Here is the home of the small farmer. And here, as much so as upon the large river plantations, cotton is the only money crop. As a cotton producing territory, this section is not so important because of the amount of cotton grown as it is for the number of people which the crop sustains. Roughly speaking, not over one-third of the cotton crop is produced here, yet it supports at least one-half of the rural population. Because of the thinness of the soil, commercial fertilizers are used quite extensively. This, together with the lack of up to date agricultural implements on these small farms, makes the cultivation of cotton over this section more costly, acre for acre, than it is in the much more fertile "Black Lands" and on the large river plantations, where the production per acre is three or four times as great. Hence, the margin of profit being so small here, the introduction of the boll weevil would, at the present price, eliminate this entire section from the producing area. The same might not be said of the better class of cotton lands if cultural conditions were to remain the same. But since this invasion will surely require a revolution in the methods of cotton culture, there is some doubt as to the ability of the average plantation darky to handle the situation. The cultivation of cotton on the large river plantations has been heretofore purely routine work, so far as the negro is concerned. Despite many

assertions to the contrary, the stubborn fact still remains that the average negro farm hand is lazy and slovenly in his work. And it will require years of patient endeavor to instill scientific exactness into such material. No matter what changes are made in the methods of cultivation, the quality of the work actually performed will be of a low grade. However, this obstacle is not so formidable at it at first appears. Comparatively few negroes working land on shares have anything at all to say in regard to the management of their own crops. If the plantation is a large one, the field work is always under the direct control of an experienced cotton grower, who as a rule is a good, progressive business man, capable of appreciating and of putting into practice commendable cultural changes. Upon this fruitful soil much of the seed of practical experiments will fall. And here, perhaps, will it bear most fruit.

Cotton Boll Attacked by Larva

Larva in Cotton Boll

The advance of the boll weevil will probably make as great a change in the local business world as it will in the agricultural. In newly infested territory the chances are that acute financial depression will prevail for a time. Yet when these symptoms disappear that section may find itself purged of one of its most griping evils—the credit system.

At least three-fourths of the retail business of the cotton area is done on credit. The plantation hands and small farmers in general, who grow nothing but cotton as a money crop, mortgage this crop in the spring as security for a year's supplies. Many farmers of good standing run open accounts. In order to secure himself against possible loss, against this latter class, the merchant tacks on to the price of his goods an average of about twenty per cent. To Northern merchants who figure on close margins this percentage seems exorbitant for nine months' credit, and so it is to those who pay promptly. For they not only pay their own obligations, but also in

the end those of that class who cannot or will not pay. But with those who have given mortgages and are able to meet their payments, the old account runs over from year to year. The farm hand, being tied to the merchant, is unable to secure credit elsewhere; and the merchant, having the old account invested, so to speak, in the hand, cannot afford to drop him and lose both principal and interest. So the time is extended, and the mortgage renewed year by year, each hoping for an abundant crop and a high price to set him free. From the temporary financial chaos that would result from a blotting out of cotton raising in a given district there might possibly evolve a business world having a cash basis.

With this crisis pending, every one interested in Southern agriculture should ponder well the future. The recent appropriation by Congress of $250,000 for a further investigation of the cotton boll weevil by the Department of Agriculture was very timely. The Secretary of Agriculture has planned his campaign most wisely. Farmers' co-operative demonstration work; plant breeding for more prolific and quick developing varieties of cotton; a further search for a parasite of the boll weevil, and experiments with the object of securing a diversification of crops will be the more important lines of investigation. Perhaps the last named will be of most good to the average Southern farmer. There is no section of the United States, with the possible exception of California, that is more adapted to so large a variety of crops as is this Southern upland country, and there is no section more wedded to cotton. Fruit raising along lines of direct shipment would be very profitable, especially if peaches, strawberries and figs were grown. Further away from transporting facilities, and where the land is cheap, cattle and sheep raising, if made a careful study, would doubtless prove more profitable even than cotton. Investigations in regard to sugar beet raising may show most surprising results. In fact, the chances for diversification in crops are manifold. The real issue, however, is financial independence. If out of this wreck of traditional business methods grows a cash basis, the advent of the weevil may be a blessing in disguise.

WASHINGTON, D. C.

The Jessamine Bower

BY CLINTON SCOLLARD

I KNOW a bower where the jessamine blows,
Far in the forest's remotest repose;
If once the eyes have beholden the golden
Chalices swinging, farewell to the rose!

Just at the bloom-burst of dawn is the hour
God must have fashioned the delicate flower,—
Wrought it of sunlight, and thrilled it and filled it
With a beguiling aroma for dower.

There doth the palm-plume o'er-droop and the pine;
There doth the wild-grape distil its dark wine;
There the chameleon, gliding and hiding,
Changes its hues in the shade and the shine.

Luring the lights are that falter and fail,—
Beryl and amber and amethyst pale,
Splashes of radiant splendor and tender
Tints as when twilight is deep in a dale.

By no bold bees are the stillnesses stirred;
Scarce is there bubble of song from a bird.
Save for the turtle-dove's cooing and wooing,—
Rapture without an articulate word.

Sway on, O censers of bloom and of balm!
Sweeten the virginal cloisters of calm!
Be there one spot lovely, lonely where only
Peace is the priestess, and silence the psalm!

CLINTON, N. Y.

The Penalty for Inflated Cotton Prices

BY FREDERIC COURTLAND PENFIELD

[Mr. Penfield has had a varied and distinguished literary and diplomatic experience. While serving as our Diplomatic Agent and Consul-General to Egypt he made himself an authority on the Khedive's country, as his book, "Present Day Egypt," will testify. He is now engaged in making a study of the West Indies from a political and commercial standpoint. He has traveled so extensively in those parts of the earth where cotton may be produced to compete with that raised in the South that his warning in the following article is as authoritative as it is timely.—EDITOR.]

"The insufficiency of the supply of raw material, upon which the great cotton industry of this country depends, has inspired me with deep concern. I trust the efforts being made in various parts of my empire to increase the area of cultivation may be attended with a large measure of success."

THIS quotation, from the King of England's speech opening the present Parliament, has as forceful a significance to the people of the United States as any commercial utterance from any source could have. In simple language it means that the spindles and looms of England want to cast off the thraldom of American cotton, and obtain their staple as far as possible from the colonies and controlled countries of the British Empire. And English looms, it should be known, fabricate the cotton worn and used by a quarter of the people of the earth.

With the friendliness prevailing in England for the United States, only a dire situation could have compelled the King to say what he did—and these words were weighed beforehand by Premier Balfour and his colleagues. The closed mills and idle population of Lancashire supplied the motive for the pronouncement, obviously.

The day prior to King Edward's statement the ruling price of cotton on the New Orleans Exchange was 18 cents, and a fraction below this figure in New York—the highest since the days immediately following the Civil War.

Coincidently with this record Mr. Sully was saying in a magazine article that the rise in the price of the staple was solely due to inexorable laws of supply and demand; that the short crop, damaged by boll weevil, made the price. No amount of manipulation, Mr. Sully insisted, could boost the quotation to the dizzy hight attained. If Mr. Sully was sincere when writing his opinion, the appearance of the article almost on the day of the wildest scenes ever witnessed on cotton exchanges was unfortunate.

Commodity students and statisticians say that "on form" cotton has for several weeks been worth 11 cents per pound, and not more. When the 18-cent price was reached, Mr. Sully, who, with serious countenance, had insisted there was "no manipulation," is reported to have won between $3,000,000 and $6,000,000 by his *coup*. Then, in four days, the price of the staple ran off four cents a pound! No sane person believes there has been any basis for cotton prices for months other than barefaced manipulation.

Is it wise, this placing of a fictitious value on America's great commodity, with paralyzing effect on a dozen departments of trade, and silencing spindles and looms of New England as well as of Lancashire? It is unwise, a hundred times over, and the penalty for the market-rigging by conscienceless speculators contains potentialities amounting to a national misfortune.

For a century Englishmen have chafed under the dependence of British manufacturers upon American raw cotton, and Frenchmen and Germans have never liked the monopolistic aspect of our staple. All have a wholesome dread of the gambling methods that fix the cost of supply; most manufacturers in Europe will admit their willingness to cope with conditions of supply and demand, but all fear speculative moves leading to "corners" as they would a visitation of plague. Stated plainly, our foreign customers stand in horrible fear of the speculative incubus engrafted upon the cotton plant.

England's sympathies with the Southern States during the Civil War was based wholly upon self-interest; and the blockaded ports of 1861-64 brought Egypt into the market as a purveyor of cotton, and she waxed fat on dollar-a-pound staple. The Nile country did not cease growing the fiber with the cessation of strife in America; on the contrary, the industry has advanced until now it is the only one between the Fayoum and the Mediterranean. Fifty years ago there were no cotton plants in Egypt save those in pashas' ornamental gardens.

Sir Samuel Baker, descending the Nile after the researches which proved that the great river had its origin in the overflow of Lakes Victoria and Albert, wrote in 1867:

"The Nile might be so controlled that the enormous volume of water that now rushes uselessly into the Mediterranean might be led through the deserts to transform them into cotton fields that would render England independent of America."

Under Britain's "occupation," with perennial irrigation assured by the barrages near Cairo and Assiout, and the great reservoir at Assouan, Egypt produces now nearly the equivalent of 2,000,000 bales, American standard. It should be remembered that the Egyptian bale is of 750 pounds, not 500, as in the United States; and that the Egyptian staple, nearly an inch and one-half in length, finds ready sale in normal times at a price two cents per pound in excess of the quotation for American upland cotton. Edward Atkinson has long held that no tropical climate could produce a fiber that could take the place of the American; yet so superior is Egyptian cotton for special uses that even the United States buys annually more than 200,000 bales of it. Mr. Atkinson's criticism applies to the product of the Lagos district, on the west coast of Africa, which is short, rough and of low grade. But this cotton competes with American as supplementing standard fiber in the spinning of common threads.

As rapidly as irrigation science adds to the cultivable area of the valley of the Nile the soil rescued from the desert is planted either with cotton or sugar cane; with American fiber commanding a fancy price, the Nile farmer will presumably decide to expand his cotton crop at the expense of cane interests. The magical fecundity of the Nile soil permits the gathering of a crop frequently running to 500-weight per acre. This is twice the product of the best lands of the Southern States, and the Egyptian has the added advantage of immunity from freaks of temperature, labor difficulties, and, thus far, of boll weevil. If need be, he might market his staple at two cents a pound less than the American agriculturist could, and make a profit.

In Nubia and in the Soudan are vast stretches of river lands that can easily be made white with cotton blossoms in a year's time; and an enterprising American, Leigh Hunt, is embarking a fortune in the project, which in no sense is academic. In India, as well as on the west coast of Africa, the soil is being exploited for cotton, the movement having the backing of ample British capital. A most aggressive organization is the British Cotton Growers' Association, to encourage the industry in the colonies, with headquarters at Manchester—one of the first to express by telegram to Mr. Balfour its gratitude for the King's utterance from the throne.

France, too, has a similar association, "in consequence of the increasing menace of American competition, which, if unchecked, will become a monopoly," its prospectus plainly states. In her African colonies Germany has experimented with cotton growing, and is rewarded by producing a marketable crop of high grade staple of the Egyptian type. The West Indian island of Barbados is already producing 20,000 bales, and a recent commission to New York to purchase ginning machinery stated that in three years the island would yield five times this amount. Several South American countries are growing cotton in a tentative way, and the production of the Crimea and other Russian regions contiguous to the Black Sea is greater than generally supposed. Yankee capital is known to be nibbling at a scheme for turning an enormous tract bordering the Atrato River in South America into a cotton field. Better staple now grows there wild than any produced in North America. The tropical and semi-tropical zones are full of possible cotton lands, and the Creator gave the Southern States

no monopoly of the crop. It is dangerous generalship to underestimate the enemy's strength.

One has not to look far for the reason for current activity in seeking to add to cotton-producing areas outside the United States. It is the uncertainty of price for American cotton that explains why capital is being embarked in national movements against our staple, and this may develop into a determined trade-war against Uncle Sam. Every added acre of foreign soil under cotton cultivation the coming season will forever be an acre competing with an America acre. Of course, America will always lead in producing the staple; but the aggregate competition of other countries may in time threaten the king of American crops. It may be claimed for Sully, Brown *et al.* that the South has now "money to burn," as a result of their price-inflating methods; but it would be a sad aftermath if the conflagration a very few years hence had to be fed with raw cotton. Some critics of their proceedings believe that these gentlemen have played fast and loose in a game possessing an attribute of the boomerang.

Overproduction in the very near future is probable—and for this the actors in the recent orgy of prices will be responsible. When cotton sold at five cents a pound, from natural causes, the planter was an object of pity; with the staple manipulated above 17 cents by a gambling crew, probably never producing a single stalk of cotton, the planter was an object of pity and solicitude.

NEW YORK CITY.

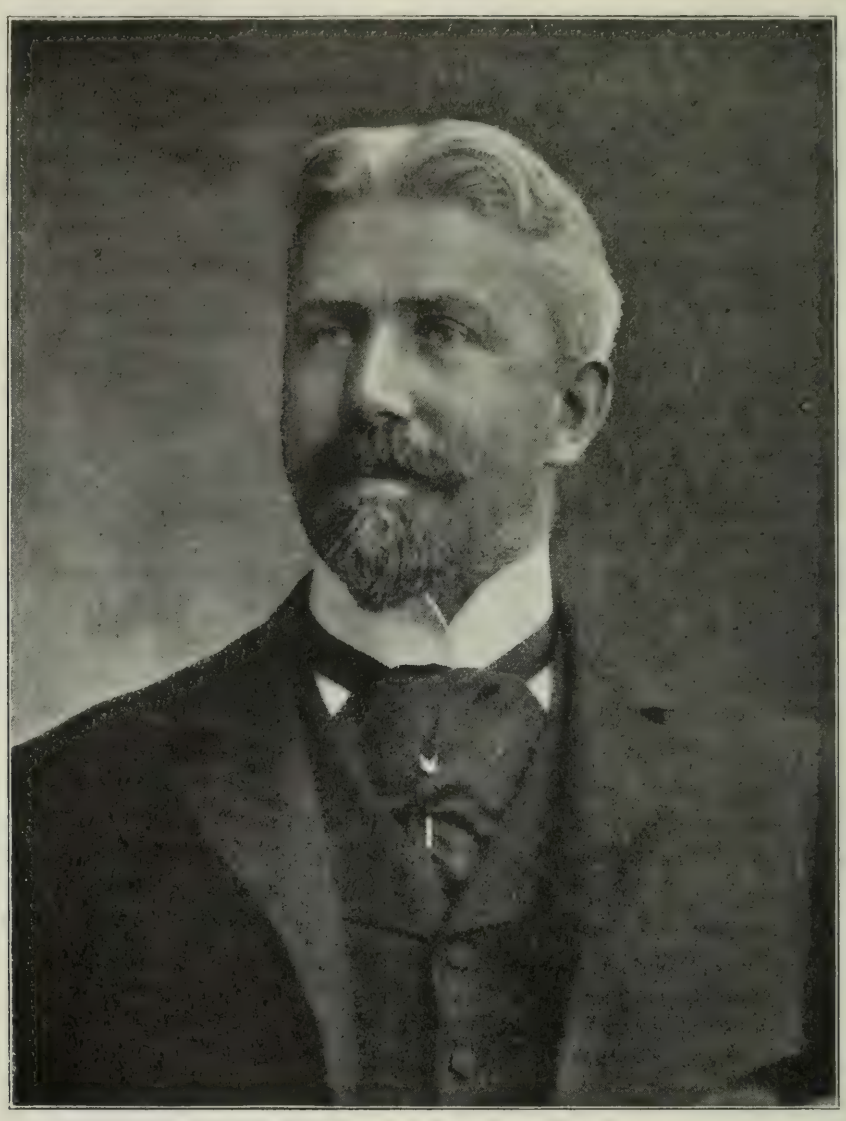
The Cigaret Habit—A New Peril

BY CHARLES BULKLEY HUBBELL

[Mr. Hubbell is one of the most distinguished educators of this city. For three terms he served on the Board of Education under Mayor Strong, and in 1897 was elected President of the Board of Education, and later, upon the reorganization of the Board of Education of Greater New York, was unanimously elected its president. At the same time he was made chairman of the Board of Trustees of the Normal College and the College of the City of New York. He has been a Trustee of Williams College, his alma mater, and is now president of its New York Alumni Association.—EDITOR.]

LOCAL newspapers of recent date contained dispatches from London stating that a current issue of the London *Times* included a manifesto demanding legislation by Parliament looking to the prevention of juvenile cigaret smoking, and added that an entire column of that influential journal was required to contain the names of the signers of the petition. It was stated that the list included Peers, Bishops, Judges, the leading head masters of colleges and medical officers.

This is an encouraging development to the men and women in this country who realize the serious menace that this comparatively new vice has assumed.



Twenty-five years ago the sale of cigarets in this country was comparatively small. Their use was first observed among the students of the Rensselaer Polytechnic Institute at Troy, N. Y., which was and still is patronized extensively by Cubans and South Americans. The cigaret habit and the inhaling habit spread from that point until now it is more devastating to the health and morals of boys and young men than any habit or vice that can be named.

The astonishing feature of the situation is that so comparatively few people realize the inroads that it has already made on the health, morals and possibilities of usefulness of our American youth. One explanation of this, in my opinion, is contained in the fact that a very large number of physicians in every community are addicted to the cigaret and the inhaling habit, and naturally are handicapped in the influence that they should exert in advising and suppressing this alarming evil. It is seldom that one meets a medical student who is not banefully addicted to this vice, and once the cigaret habit becomes established its servitude is almost certain and unending.

The writer of this article has no griev-

ance against the rational, reasonable and normal use of tobacco by those who have reached an age when the period of physical growth and development has been passed, and who can honestly provide the means of indulging in a habit that, while not to be indiscriminately commended, is in the opinion of most physicians comparatively harmless under such conditions.

The writer in using the terms "rational and normal" means that the one indulging in this habit shall never inhale the smoke. Much misapprehension exists in the public mind on the subject of the cigaret. We hear it stated not infrequently that the cigaret is deadly, because it contains opium, or because the paper wrapper is very injurious. I am persuaded that the reasons assigned are quite incorrect. The manufacturer could not afford to put opium in his product at the price he receives for his goods. None of the cheaper grades of cigarets contain opium or any of its products. The cigaret is deadly because it breeds the inhaling habit, which is the foundation of all the evils that accompany indulgence in this vice. The juvenile cigaret smoker almost immediately learns to inhale the smoke. Not one cigaret smoker in twenty, I venture to assert, uses them in any other way, and when once the victim has acquired the inhaling habit in connection with cigarets, he can seldom secure any satisfaction with pipe or cigar without indulging his inhaling propensities. The normal smoker draws the smoke into his mouth and expels it, with the result that the minimum of the products of combustion—namely, nicotine, the volatile oils,

CHARLES BULKLEY HUBBELL

and the deadly carbon monoxide (CO) get into his circulation. I honestly believe that very few healthy adults are injured by a reasonable use of tobacco in the way described. The cigaret smoker, however, takes a deep inhalation of the smoke, which at once reaches the upper air passages of the lungs, where almost immediately are released into his circulation the products I have referred to, usually causing the slight dizziness and the mild intoxication that is so fascinating and so devastating.

The London *Lancet,* one of the most reliable medical journals published in the English language, has recently stated that the most deleterious product in the combustion of tobacco is carbon monoxide, which is the deadly constituent of water gas, and is present in comparatively large quantities in tobacco smoke. This is the poison that is responsible for the utter demoralization of that unhappy individual who has come to be known as the cigaret fiend, whose pale face, shattered nerves and hopeless position in the community is recognized as applying to many of our American youth, whose opportunity for usefulness and happiness has passed away.

Experiments have demonstrated that this poisonous gas is taken up by the blood when tobacco smoke is inhaled.

It will be observed that the evil and the danger is in the *inhaling habit,* and is greater when related to the pipe or cigar than in connection with the cigaret, altho it is obvious that the cigaret is the nurse and tutor of the habit.

I have never known a smoker to begin the inhaling habit with a cigar or pipe, but nearly every cigaret inhaler soon extends his operations so that in a comparatively short time he includes pipe and cigars in this abnormal and dangerous manner of indulging in what might be a comparatively harmless habit.

What is the explanation of this extraordinary campaign against this vice in London? It is simply that they have waked up to the importance of some concerted effort to lessen an evil that has already shown itself in the deterioration of the health and usefulness of the youth of that country. The same situation is present in the United States.

A few years ago it was the privilege of the writer of this article to render some service in connection with the administration of the public school system of this city. During the period covered by that service several of the principals in the public schools complained of a condition that it was difficult for them to understand. Boys of ten, twelve and fourteen years of age, naturally bright, were observed to be losing the power of concentration and application of mind. Nervousness, listlessness and a tendency to truancy were associated with the names of nearly every one of them. It was found that nearly all the incorrigible truants were cigaret fiends; that is to say, they were almost hopelessly addicted to the inhaling habit. Their nerves were shattered, and the value of public school instruction was greatly lessened in their cases. Further investigation disclosed the fact that very many of these boys stole money from their parents, or sold all sorts of articles that they could lay their hands on, in order that they could gratify an appetite that fed on its own indulgence.

A Justice of the Supreme Court of this State, since deceased, told me that in the last year that he was practicing at this bar, he had had nine office boys in his employ who had been discharged for stealing postage stamps, it having been proved in every instance that the boys stole in order to purchase cigarets. There were laws on our Statute books at that time, forbidding the sale of cigarets to boys appearing to be under sixteen years of age, and the law doubtless was restrictive in some small degree in relation to the sales to young boys, but was entirely inadequate to cope with the evil. That will be found to be the case in England. The only way in which there can be any substantial improvement in what is now a most alarming situation is by creating a sentiment against indulgence in such a devastating vice, and experience has shown that that sentiment can be created.

The writer, with the co-operation of a number of school principals in this city, and with contributions from several of his associates in the Board of Education and some friends outside to meet the expense of the movement, was able without very much effort to enroll over 25,000 boys in the public schools of this city in anti-cigaret leagues, organized in the

schools, for the purpose of preventing the growth of the evil that the boys soon came to understand and avoid. A constitution and by-laws and the machinery of intelligent organization were provided, interest was excited and maintained, and much was done to arrest the growth of the vice. Intelligent instruction with reference to the subject was given, and the boys soon came to understand that they could not compete in the struggle for success after they left school if they were handicapped by the habit that rendered their employment undesirable in offices and by corporations down town. The establishment of these leagues extended to various parts of the country, and afterward they were established in England on the same lines as here indicated.

The astonishing thing about the situation is that, so far as I am informed, there is not a college in the country where any effort has been made to stamp out the cigaret inhaling habit, and little or no effort has been made to warn college students who are leaving our academic institutions every year by hundreds, with health more or less shattered, as a direct result of four years' indulgence in the inhaling habit. In my opinion there is no more important matter to be considered by our college authorities than the subject matter of this article. It is rather a delicate matter for some of them to handle, as some of the professors in our colleges are hopelessly addicted to this habit, and their usefulness is affected, in my opinion, quite as seriously as tho they were addicted to the alcoholic or the morphine habit. Many of the physicians in the college towns are themselves inhaling fiends and are not in a position to give influential advice. When the boys and young men come to understand that there are hundreds of offices in all the large cities where the inhaling victim cannot secure employment, it would be natural if they should have some feeling of resentment toward those who should have pointed out their danger years before.

In my opinion there should be an organization established in every college by the manly leaders among the students, whose object shall be to induce the freshmen on entering to pledge themselves against such an un-American, un-Yale, un-Harvard—and, may I mention my own alma mater?—un-Williams vice. There should be an organization formed in every city and town in the country with a view of bringing the influence of the best citizens to bear against the further spread of this disastrous evil.

Any effort in this direction will be met by efforts of the cigaret manufacturers to demonstrate that the cigaret is quite innocuous. At about the time the writer of this article was most interested in the movement referred to, an article written by an alleged medico-legal expert was very largely circulated, its object being to demonstrate that the cigaret was a most innocent and harmless combination of paper and tobacco. Similar activity is again apparent.

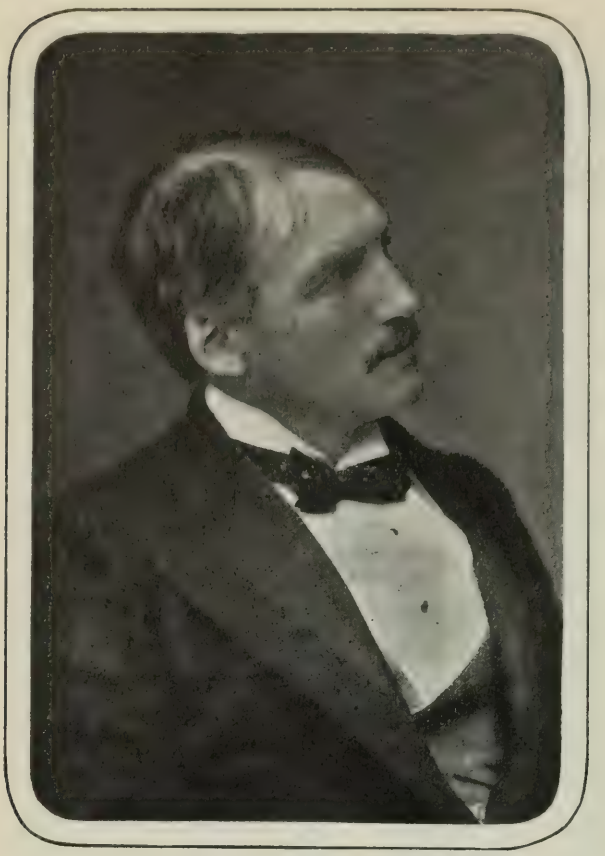
The Police Magistrates of this and other cities have stated again and again that the majority of juvenile delinquents appearing before them are cigaret fiends, whose moral nature has been warped or destroyed through the instrumentality of this vice. The managers and trustees of institutions for the correction and reformation of youthful offenders have the same story. The Code of the Junior George Republic, realizing this truth, prescribed one of the most severe forms of punishment for the infraction of the rule relating to cigaret smoking, and I have been informed by good authority that many of the gold cure establishments refuse to receive any alcoholic patient who is also addicted to the inhaling habit, for the reason that experience has shown that no relief can be expected in such cases.

Parents should inform their boys of the danger attending any indulgence in this habit before they are likely to contract it, forbid it, and should, in my opinion, visit condign punishment on those who offend against this parental law.

The city of Chicago, I have been informed, has an organization of business men, numbering several thousands, pledged not to give employment to any boy or man who smokes cigarets, or who has the inhaling habit. There should be such an organization in every city and town in the United States, in order that our boys may have the chance at success that God Almighty intended they should have.

New York City.

Politics and Literature in England

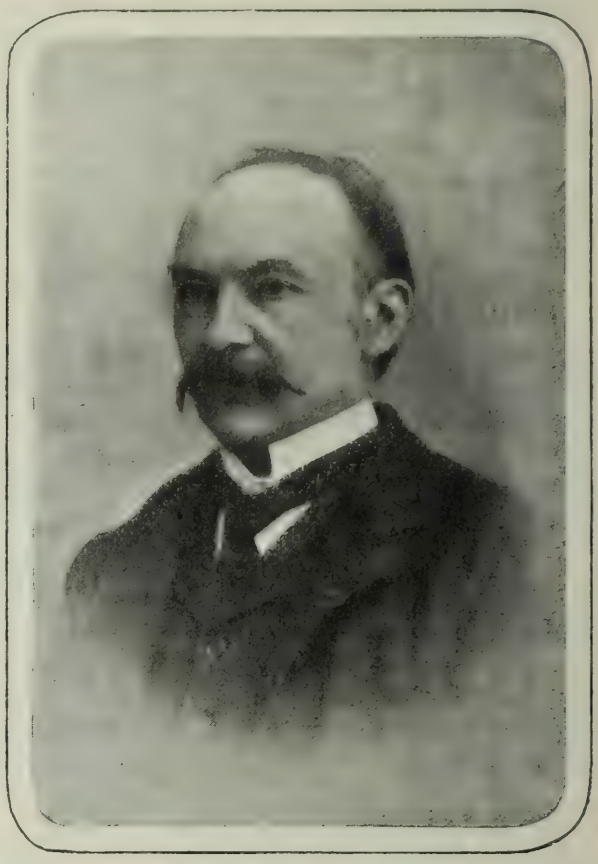


BY JUSTIN McCARTHY

POLITICAL life in England is just now passing through a state of almost bewildering confusion. I cannot recall to memory any other period when English political parties were in such a state of perplexity, incohesiveness and even distraction as they are at present. It is not always easy for even a practiced observer of political life to be certain just at present about the classification of Parliamentary partizans. The mere fact that a member of Parliament sits on the side of the Government or on the side of the Opposition does not by any means enable us to decide offhand what political leader he is likely to follow when some great controversy may arise. He may have been and may be a professed Ministerialist and yet it is quite possible that he may, on some coming occasion, support Mr. Chamberlain against Mr. Arthur Balfour, or vote with Mr. Winston Churchill against both of them. He may sit on the Liberal side of the House of Commons and yet join with the Tories in voting against measures of Liberal policy for Ireland. There is every promise, therefore, that the coming session of Parliament, which is to begin in the first week of February, will entertain, or bewilder, or depress the public with the most curious complications and the most unexpected events.

In the meanwhile there is one positive fact of which neither British Liberals nor British Tories seem to me to make much account. That fact is the existence of the Irish National Party, with its cool-headed, steady-nerved, far-seeing leader, Mr. John Redmond, and with his followers absolutely united and acting like one man under his guidance. Mr. Redmond has at his command in the House of Commons a number of Irish votes quite large enough to give the victory to Government or to Opposition at any sudden crisis which is likely to arise for some time to come.

We are expecting a General Election before long and in the distraction caused by Mr. Chamberlain's agitation it is not likely that either side will come out of the ordeal with anything like a commanding majority. The result of this state of things must soon make itself perfectly clear even to those on either side of political life, who seem at present to regard Mr. Chamberlain as the one moving force and the one object of conjecture and speculation. It will soon be found—will be found when the first great and critical division is taken in the House of Commons, that Redmond can give the battle to the hands of that English leader, Liberal or Tory, who can offer the best terms to the Irish people. Already we hear conjectures as to what concession the Liberals or the Tories might be likely to make to Ireland as regards national education, or the working of the recent Land Act, and there are ingenious speculations as to what Lord Rosebery and Sir Henry Campbell-Bannerman might do in combination on the one hand and Mr. Balfour and Mr. Chamberlain, once again in combination, on the other. But I think I may venture to assure my readers that the statesman who hopes to win the favor and support of John Redmond and the Irish National Party will have to come to terms on the subject of Home Rule, and need not trouble himself to devise any other terms of arrangement. Meantime we live in a state of painful alarm and expectation as to the probable bursting of the war-cloud which darkens the Far East, and we rush to newspapers every morning eager to know whether the strife has yet begun or is put off for another day or two. As I write this article events remain in just the same state of uncertainty as they were three weeks ago. Most people say and believe that war between Japan and Russia is inevitable, and that the only doubtful question is whether the struggle can be confined to Japan and Russia, or whether other great Powers, including England, are not to be drawn in as well.



The death of George Gissing, at a time

ALFRED CHICHELE PLOWDEN

of life when his creative powers were only reaching their highest level, is a severe loss to English literature. Among the novelists who might still be said to belong to the younger school Gissing was, according to my judgment, the most original and the most variously gifted. He was able to take up what might have seemed to be the most commonplace materials and to fashion out of them a work of art which compelled universal admiration. From the poor and squalid lives of that class of Londoners about whom London society knows little or nothing, Gissing was able to draw forth living pictures, in which the tragic and the comic, the poetic and the prosaic, the heroic and the ignoble, expressed themselves in marvelous artistic blending. The pity of it is that Gissing's latest work, "Henry Ryecroft," seemed to display some faculties in the author for which even his warmest admirers had not given him credit before, and led us to expect that he was only entering on the brightest part of his career. He had but lately completed his forty-sixth year, when all came to a close. It is something, however, to feel sure that the work he has accomplished will have a place forever in the literature of his country.

I first made the acquaintance of George Gissing several years ago in London. I think I may say that I was one of those who had appreciated his genius from the time when he first gave the world a chance of appreciating it, and I was delighted to have an opportunity of meeting him in person. He was still but a young man and he had a very handsome and striking presence, and I can well remember the subject of our first conversation. In one of his novels I had come upon a short passage which made seemingly casual reference to the scene

THOMAS HARDY

which he looks upon who stands on the Acropolis in Athens, close to the Parthenon, and gazes around him. I knew from those few lines of description, or, indeed, rather of suggestion, that Gissing had stood there himself, and looked upon that wonderful scene with his own eyes, and I told him so, and then we talked for the most part of Athens and of Greece. I had myself fallen in love with Athens and with Greece during a visit of some years before, and I found that Gissing was a lover like myself, and

so, to quote some words from a once well-known poem, "We talked of old Greece in that hour."

I had few opportunities of meeting him since that time, for he spent much of his life in the south of France and in other sunny regions, but we kept up our acquaintanceship—I am sure I may call it our friendship—until the close of his earthly life. I am afraid that earthly life of his was not very happy, and, indeed, I know that it was darkened by some troubles which a man of his mold and temperament would naturally have taken much to heart. But, of course, a nature so artistic as his, so quick with sympathy for all that is beautiful in nature, in art, and in humanity, must have found much high and genuine enjoyment in a life like that which his intellect, his tastes and his imagination procured for him. He loved travel and took an intense delight in beautiful scenery, and in historic monuments of the past, as may be seen in many of his writings. Most of his readers, no doubt, associate him chiefly with London streets and with the more squalid life of London, but I must say for myself that my impulse is always to associate him with the shores of that Ionian sea which he has described with such exquisite touch, and with those feelings which were aroused in him by the study of that scene beheld from the Acropolis of Athens. The last letter I received from him bears date April 21st, 1903, and was written from the south of France not long before his final break down. He then wrote:

"I am less ill than I might be; but I can't walk, I can't talk much, and my work is reduced to a minimum. So things will go on, I suppose, for a few years yet. The less said of it, the better. . . . And you? Greatly better, I trust, than when I last had direct news of you. I hope you have no longer any trouble with your eyes, and that you are living in some place where you have beautiful and cheerful things to look upon."

In the same letter he says:

"As you will probably have suspected, 'Rye-croft' is a favorite of mine, and I feel very grateful to any one who speaks well of him."

I have only to add that the best understanding any reader can form of Gissing's real nature, emotions, yearnings and artistic sympathies will be obtained from a study of this latest book of his, which, fortunately for the world, has not been left like "the unfinished window in Aladdin's Tower."

The literary world of these islands has been a good deal puzzled and even bewildered by the publication of Thomas Hardy's new book, which bears the name of "The Dynasts."* This book is described as the first part of a drama, and the drama, it seems, is to have three parts, nineteen acts, and one hundred and thirty scenes. I am, and have always been, a warm and sincere admirer of Thomas Hardy's novels, the originality and genuine value of which I am glad to say I recognized from the very first, and I have known the author personally for a great many years. It is needless to say, therefore, that I should most cordially wish for him a full success in every literary venture he may make, but I confess that I look with something of dread to this latest and very heroic experiment. "The Dynasts" is a dramatic poem which sets about to illustrate the story of the Napoleonic wars between England and France, and to do this not merely

GEORGE GISSING

* Reviewed in THE INDEPENDENT last week.

by scenes pictured from what we know as the living world, but by imagined scenes from worlds beyond mortal ken. Among the "*dramatis personæ*" we meet with strange, weird, spirit forms as often as we might do in Goethe's "Faust" itself, and thus we are invited to understand how the doings of Napoleon, on the one hand, and of King George and William Pitt, on the other, were regarded by the mystic beings who float in an atmosphere higher than that of us mortals. Altho "The Dynasts" is called a drama, it certainly cannot be intended for the stage, and thus Mr. Hardy is not merely making an experiment in a field of literature entirely new to him, but he is also attempting the creation of a drama which by its very nature is unavailable for the dramatic arena. I have not yet been able to study this first part fully enough to form any critical idea of its possibilities, and one is at least bound to assume that a man like Hardy must have some clear conviction of his capacity for such an unexpected effort before going entirely out of his way to make such a venture. Still I must own that I regard the attempt with some trepidation and can only hope that, since Thomas Hardy has written and published the first part of "The Dynasts," he may be able to convince his admirers and the world in general that he was well justified in his bold and unexpected enterprise.

A book well worth the notice of American readers is the volume just published by Fisher Unwin, of Paternoster Square, London, and which bears the title of "Grain or Chaff? The Autobiography of a Police Magistrate, Alfred Chichele Plowden." Mr. Plowden is one of the best known and most popular among the Police Magistrates of London, and a London Police Magistrate holds a somewhat peculiar position. Of course, he has to deal with the ordinary cases which come before him and to dispose of them himself, according to his own interpretation of the evidence and the law, or else to remit them for trial to some higher court of justice. But he is also a sort of official adviser to all the poor of his district who come to his court for the purpose of obtaining his instruction as to what they ought to do in this or that emergency or embarrassment, and he has it in his power to offer money relief from the funds of his court to any applicant who seems really to be in need of and to deserve his help. He has, indeed, to discharge functions which sometimes remind me of those performed by an Ottoman Cadi, as we used to read of the latter official when we were in the habit of studying the "Arabian Nights." Such a magistrate, therefore, holding office in London's most populous districts must have incessant opportunities of receiving extraordinary applications and dealing with extraordinary applicants and emergencies.

Mr. Plowden seems to be a man endowed with a keen sense of humor and a shrewd judgment of character, and in these reminiscences he tells us of the most remarkable cases he has had to try and of the curious and interesting figures which have come under his observation. The narrative does not limit itself, however, merely to the author's experiences as a London Police Magistrate, for it tells us much about his previous career at the Bar and some of the great causes in which he was concerned, and the eminent advocates under whose leadership he performed his part. The materials for a most interesting volume were thus evidently placed within the author's reach, and it is not too much to say that the most effective and attractive use has been made of them by Mr. Plowden in this entertaining volume.

The readers of THE INDEPENDENT may remember that I gave them an account not long since of a very interesting and, indeed, a very valuable work, entitled "Recollections of a Diplomatist," by Sir Horace Rumbold. Those readers will, therefore, be glad to learn that a second series of the recollections has just been published here. I have not yet been able to read this later publication, but I shall probably have something to say about it in my next article, and in the meantime I cannot forbear to mention the fact that these later recollections have already made their appearance in print.

LONDON, ENGLAND.

Literature

The History and Art of Florence

THE many lovers of Florence and Florentine art have long felt the need of a history which should contain a succinct, convenient but complete account of the deeds and character of a race whose art rivaled that of the Greeks. The three existing histories of Florence, written in English, are too long for the general reader, and the meagre criticism of Florentine art contained in their pages is quite out of date. Now, as Mr. Hyett justly remarks, "When we look back . . . upon medieval Italy and upon Florence, it is of painting and sculpture that we think first." Therefore, no account of Florence which does not devote a fair amount of space to her arts can be satisfactory or adequate. To supply this want, Mr. Hyett has undertaken to write a short but complete history of the Republic, from its rise to its fall.*

The origin of the city of Florence and the derivation of its name are alike involved in obscurity, and it was not until the twelfth century that the Commonwealth was born and began its riotous career. The political history of its inhabitants is but one long story of war to the death between numberless factions. Whatever may have been the first pretext for these deadly feuds; whether, as with the Guelphs and Ghibellines, or the Bianchi and Neri, the old saying holds goods, "*cherchez la femine*," or whether personal ambition was the source of strife, certainly in the end individual and family feuds merge into the eternal conflict between aristocracy and democracy. The Florentines were of an inflammable, loquacious, implacable nature and the record of their endless squabbling and brabbling becomes almost intolerable. The reader is tempted to wish that the author had dwelt less on the political crimes, and more on the genius of a race which produced a Dante, a Leonardo da Vinci and a Michael Angelo.

Mr. Hyett does not pretend to have made any original research among documents, but he has consulted many Italian authorities, and has generally shown sound judgment in his selection of material. His wisdom and moderation are specially noticeable in his estimate of the character of the great personalities who, from time to time, emerge from the mob. Especially discriminating is his analysis of the motives of such men as Cosimo and Lorenzo de Medici. He assumes that they were neither remorseless tyrants who destroyed the liberties of the people, nor disinterested, self-abnegating benefactors, but men of mixed motives, who gave the so-called Republic the only kind of stable government possible under the conditions.

> "Representative government failed in Florence, not through the wiliness of the Medici, but because her citizens, brilliant and intellectual as they were, had not acquired those habits of self-control, or reached that stage of moral development, which is the only sure foundation on which that form of government can rest."

The doom of the Republic was sure. Charles V and Clement VII, tyrants less scrupulous than Cosimo or Lorenzo de Medici, converted the exhausted province into a duchy. "Henceforward, Florence was subjected to what she had been struggling against for centuries—*il governo d'un solo.*"

Mr. Hyett lacks the technical training necessary to an art critic, and being conscious of this deficiency he has depended upon a multitude of counsellors, sometimes to the confusing of his judgment; as, for example, when he confounds "naturalism" with "art for dexterity's sake," and makes it responsible for the wrecking of Italian painting. In truth, it was no form of "naturalism" in Michael Angelo's art which gave warning of the decadence, but his deliberate exaggeration and distortion of nature to enhance the poignancy of expression. And yet in judg-

* FLORENCE: *Her History and Art to the Fall of the Republic. By Francis A. Hyett, B.A.* New York: E. P. Dutton & Co. $2.50 net.

ing of the temperament of Michael Angelo, Mr. Hyett shows great insight. He feels that the artist left much of his work unfinished, not from negligence or from conscious theory, but because his inspiration failed when execution had been carried far enough to embody his ideal and yet leave something to the imagination. The author's opinions of any given painting or statue are not so trustworthy. For instance, in writing of Verrocchio's "David," he says: "The stripling who left his few sheep in the wilderness, and faced single-handed the giant from whom an army had fled, has never been more truthfully imagined." Now the "David" is undoubtedly a charming statue, but it might better represent a mischievous faun or a street gamin, than the sweet singer of Israel. In spite of these adverse criticisms, however, this is a very valuable book. It is full of information very systematically arranged. The history is divided into short periods of time, each period containing chronological diagrams of rulers and artists. The chapters on art and literature are placed at the end of each division. This arrangement, altho it detracts from the interest of the narrative, is exceptionally convenient for reference.

A College Novel

FORMERLY romance never penetrated further than the student body when the scenes were laid in college or university circles. The faculty was a dark background against which love and youth cast gay reflections. The most we could expect was that a bachelor professor would be involved, or the president exert secret efforts of discipline, designed to remind the refractory student of mother, home and heaven. But now the novelist has advanced from this class room fiction into the esoteric regions of the faculty. And when we consider the reserve, the formality, the sense of election which usually separate this august body from the students and from the merely commercial, dishwashing world outside, it is evident that nothing more adventurous has been attempted in recent fiction. The author of *The Torch* * admits that he chose the Leland Stanford situation upon which to base his dramatic assault against the despotism practiced in American universities; but he denies that "Babington" in his story is meant to typify President Jordan, of Leland Stanford, or that "Mrs. Tupper" is a caricature of Mrs. Stanford. But there can be no doubt that the book is an able tho sensational exposure of certain conditions existing there. A rich regent complicates the imperial government of the president, and further embarrassment comes from an up-to-date labor union professor, who is disposed to work conscientious havoc among the fattened, pharisaical ideals of "Babington." And it is evident that this fire brand of modern socialism is uttering the author's own sentiments where he is thus reported:

> "He criticised American universities for being social clubs instead of seminaries of research, too many receptions, too much show. Then he spoke of the fact that the president of an American university is an absolute despot, that he has more power than the head of any European university. He said it was a curious anomaly in a republic, and all of a piece with the industrial tyranny of the times. . . . The great power of the president made the teachers feel insecure. They kept their eyes open for better places, for they were usually on bad terms with the president and held him responsible for their condition. . . . He declared that a spirit of social emulation had crept into the university . . . and instructors were obliged to do all sorts of things to get their wives proper dresses. . . . Some did private tutoring, and thus laid themselves open to the charge of bribery by students that failed to pass, etc."

In view of President Jordan's outspoken criticism of the luxury and extravagance of living in Eastern colleges, and the fact that his university stands almost alone among the larger institutions in opposing the scholastic millinery and ceremonial now so fashionable elsewhere, it is curious that Leland Stanford should be selected as the object of an attack on such points.

Aside from the portrayal of the friction between regents and the president, and between the president and his colleagues, the book is significant in that it depicts the characters produced by such a college atmosphere. The

* THE TORCH. *By Herbert M. Hopkins.* Indianapolis: The Bobbs-Merrill Co. $1.50.

faculty is a small community, who love and hate one another with a sort of domestic energy. Every member of it is well informed, with the horns of his wit lowered for conquest or protection against the others. Even romance is a ceremonious state. Love is occult, psychic, and no more resembles those pretty pastorals of the heart enacted by less sophisticated types than sad, wan-faced wisdom is like the coquetry of maiden innocence. Sensuality exists also, but in men and women whose conception of the moral law is so intelligent that the frailty seems particularly obnoxious. Ambition, pride, treachery are all apparent, but in a formidable guise, augmented and dignified by the university manner, by wit, power and position.

The Art of Cross Examination*

THIS is a bright and interesting book on a subject about which it is difficult to write a book. Mr. Wellman has had a large experience in the trial of jury cases and is recognized by the New York Bar as a clever trial lawyer. His treatment both of the manner and matter of cross-examination is judicious, and his suggestions as to the difference in the course to be pursued in the examination of perjured witnesses, on the one hand, and of the large class of ordinary witnesses, who are merely mistaken or prejudiced or thickheaded, on the other, will be useful to an inexperienced advocate. His chapter on "Silent Cross-Examination" and the frequent references in the book to the folly of aimless and excessive cross-examination are full of valuable suggestions. The selections from famous cross-examinations add a valuable feature to the book. The extract from Sir Charles Russell's examination of Pigott before the Parnell Commission principally relates to the contradiction of Pigott's testimony by his letters to Archbishop Walsh, which was magnificently done. A still finer specimen of artistic professional work in that cross-examination was that portion relating to the fact that the word "hesitancy" was spelled "hesitency" in the alleged Parnell letter (the forging of which Pigott, at the trial, denied), and was spelled in the same way by him in writings executed on several other occasions, and notably on the witness stand at the opening of the trial.

The specimens, however, of cross-examination published at the end of the book, altho interesting, do not seem to us to be as valuable illustrations of effective cross-examination as some which might have been selected. The truth is, however, that it is difficult to give such specimens briefly; one generally needs to take into consideration all the main features of the case in order adequately to appreciate a fine cross-examination. In most instances in which it is necessary to demonstrate the fact that a witness has given colored or false testimony it is not some single effective point which is the true test of a great cross-examination, but the general effect which is produced by a long review of all he has said, bringing out inconsistencies and contradictions, resulting finally in the breakdown of the witness's confidence and demeanor. All this generally cannot be well illustrated by brief extracts; but, upon the whole, Mr. Wellman's book is an intelligent and clever treatment of a subject in which every actively practicing lawyer will be interested.

Religious Education

THE subject of religious education, which in England has become a political contest and in France is complicated with the strife over the religious orders, in the United States attracts less interest than in other countries, and has a better chance for fair and impartial consideration. There is general recognition that religious teaching is far behind other forms of public instruction, that modern principles of education have not been adopted in Sunday schools as in other schools, and that much well-meant work is wasted because it is based on false principles. It is encouraging that we are beyond the day of cheap sneers at behindhand features in Sunday schools, and that students of psychology and pedagogy are offering counsel and encourage-

ment to those engaged in religious instruction.

Mr. Haslett's treatise* is an effort to show how modern pedagogical principles should be applied to the Sunday school, what established traditions should be uprooted and what new methods should be introduced. He holds that no adequate or satisfactory system of Bible-study lessons is now in general use in this country. He condemns the International System of uniform lessons, because it is composed from the adult point of view and disregards the laws of child development. He says that the Blakesley System is but little better, as the grading is poorly done, pedagogical principles are not recognized, and the aim seems to be to produce prodigies in Biblical lore rather than to help the child in the unfolding of character. The true system should avoid these defects and fit the scheme to the child rather than try to force the child into the scheme of what adults imagine ought to be good for him. Mr. Haslett presents an outline of a course of lessons, but his plan is not developed sufficiently for use in a Bible school. His book is a contribution to an important and pressing subject, and contains much good material, but it would be more effective in briefer compass, with condensation of argument. For example, we do not need 15 reasons why we should not learn the catechism; most of us would forego the pleasure with far less persuasion.

Mr. Mead's book† is devoted to ways of working, and all sorts of schemes and devices to "make the Sunday school go" are described and illustrated. Remarkable industry has been shown in the gathering of materials and suggestions—the list of persons to whom indebtedness is acknowledged covers nearly three pages—and the best methods employed in hundreds of schools are classified and made easy of reference. It is a book for officers of Sunday schools, and few who turn to it for ideas about Sunday school management will not be grateful for valuable suggestions.

The Story of New Zealand. By Prof. Frank Parsons. Philadelphia: C. F. Taylor, $3.00.

New Zealand is known to Americans almost solely through the contradictory reports we have had of its compulsory arbitration law. It is not realized that this particular law is the accompaniment of other social and industrial legislation of the most revolutionary character, judged from the standpoint of what is familiar to us. Here is a people of British extraction sharing their government with a native race, a thousand miles remote from the nearest considerable population, protected from foreign complications by the ægis of the British Empire, and free to work out their own highest ideals of self-government. To understand their arbitration law we need to know the history of the people, the character of their political parties, the integrity of their public officials and judiciary, the nature of their civil service, the other kinds of industrial legislation and administration which they have taken up, and the extent to which they have really succeeded in them. We have had no convenient and complete account of all these matters, and therefore no opportunity to see any particular law in its true perspective, and for this reason this book of Professor Parsons' comes as a revelation. We are moved with wonder and almost envy when we see how easily this favored land has dealt with the evils that threaten the very existence of democracy in our own country. The list of progressive and radical measures successfully carried out is amazing. Government operation of all public utilties, government banking to prevent panics, postal savings banks, nationalization of the soil, government loans to home-builders, State operation of coal mines, State trustee for the management of estates, State title guaranty, woman suffrage, referendum, progressive taxation of land values and exemption of improvements, State purchase of patents, village and farm settlements for the poor, State cold storage and commission merchant for farmers, eight-hour day by law, direct employment on public works, mandatory arbitration of labor disputes, are the striking items in the list; but their full significance is not realized until one has learned from Professor Parsons how each came about and

how it is conducted. In his admiration Professor Parsons exclaims that New Zealand

"in its own particular field out-Americas America. From savage cannibalism to the highest civilization in a lifetime, from one of the poorest countries of the world to the richest in half a century, from racial war to racial harmony in a generation, from industrial war to industrial peace in a decade, from charity to justice, competition to co-operation, monopoly to diffusion, despotism to democracy, government by landlords and the money-power in their own interest to government by farmers and workingmen in the interest of all as the outcome of a great election, is certainly a record of change in condition and policy, which for quantity, quality and speed of progress is without parallel."

The Code of Hammurabi. Chicago: The University of Chicago Press, $4.00.

We have received from the University of Chicago Press advance sheets of Professor Harper's translation of the Civil Code of Hammurabi, on which the entire Assyriological force of the university has been at work for a year. The explanatory notes and commentary, as also the discussion of the parallelism with the biblical and other codes, will follow later. The translation includes the Prolog and Epilog, as well as the Code itself; and it is far superior to that of Hugo Winckler, which we translated from the German for THE INDEPENDENT in January of last year immediately on its appearance. Since the inscription on the stele was so speedily and admirably published by Père Scheil in the latter part of 1902 it has been the chief object of study by students of the cuneiform texts, and Professor Harper has had the advantage of their results thus far published. We note many evident improvements. Thus the first law, as given by Winckler, had to do with spells of sorcery, and the meaning was not clear, nor did the law seem quite to fit the conditions. As given by Harper it has to do simply with false charges of a capital crime. So Section 133 is made much clearer. The wife of a man taken prisoner in war is forbidden, if there is sustenance for her at home, to become another man's wife. She must protect her chastity under penalty of death by drowning. The main features of the earlier translations by Père Scheil and Winckler, of course, are not affected. On reading the Code one is impressed with the extraordinary development of legislation in the time of Abraham, about 2250 B. C., as also with the sense of both justice and piety exhibited by the lawgiver in his Prolog and Epilog. We offer but one minor criticism on this most important work, which, in its completed form, bids fair to be monumental. The figure of Hammurabi before the Sun-god at the top of the stele does not represent the king as receiving the Code from the god, but simply as worshiping him.

Our Lady's Inn. By J. Storer Clouston. New York: Harper & Bros., $1.50.

It is difficult to adopt a critical manner toward so slight and neutral a creation as this little story, wherein nothing seems serious enough to engage the mind and little amusing enough to divert it. A young girl, left orphaned and penniless, finds herself dependent upon uncongenial relations, who promptly seek to marry her off to a wealthy and narrow-minded squire in the neighborhood. The squire, depicted as a personified system of perpendicular pedantry, becomes so repellant to the girl, with his arbitrary rules and regulations, that she escapes from him and his suit by running away to London, where, masquerading in men's clothes, she passes as a boy among the male tenants of "Our Lady's Inn," which is a gentlemen's lodging-house. Even the writer's bright and plausible style cannot invest this episode with an atmosphere of reality nor save his book, as a whole, from the charge of artificiality and commonplaceness.

The Congregational Way. A Hand-book of Congregational Principles and Practices. Boston: The Pilgrim Press, 75 cents net.

This is a compact volume, described by its title, and it follows in the field marked out by Dr. S. Dexter, Ross, Ladd and Dunning. Mr. Bradford has lately said that in the management of its benevolent work the Congregational body is approaching Presbyterianism. We should not learn this from the brief sketch of Congregational history, but it can be suspected from reading a docu-

ment of the National Council in the chapter on "Organization for Missionary Work." The volume gives compact directions for the management of the business of a church, and will be of use to pastors and others. Not least valuable will be the "Rules of Order for Ecclesiastical Meetings" in the Appendix. These rules could be found useful in conducting other than Congregational meetings. We only object to one of them, that which forbids a motion to allow the secretary to cast the ballot where one is required. In cases where no objection is made and absolute unanimity is evident, the allowing the secretary to cast the ballot saves times, which is money.

Katherine Frenshaw. By Beatrice Harraden. New York: Dodd, Mead & Co., $1.50.

A neurotic novel. The people understand one another in it, not intelligently, but through their nerves, dreams and intuitions. The husband's *aura* is opposed to that of his wife's, which is too fiery red and intolerant. Everybody is sneaking through the private keyhole of his companion's heart and openly accusing him of what he found there, without decency enough to understand that he had no business in there. Meanwhile, as is usual in such cases, there is a "single lady" outside, whose *aura* exactly fits with that of the hag-ridden husband. We know what to expect in such cases; of course, the wife dies early in the tale, and these two telepathic *auras* come gradually together. But this neurosis is characteristic of Beatrice Harraden's novels. We still recall the hero and heroine of her first story, "Ships That Pass in the Night,—both too ill and irritable to be done to death by a love affair that was created to torture them. And there is a lasting frailty in any literary structure which depends entirely upon diseased nerves in human nature for its interest.

Old Furniture Book. By N. Hudson Moore. New York: Frederick A. Stokes Co., $2.00 net.

This book is very readable, containing many interesting facts respecting manners and customs of the past, collateral to the subject of furniture. It was perhaps not intended as a reference book, as its arrangement would preclude its being convenient for that purpose. It contains, however, most of the essential points, and is, in the main, accurate.

"NOTHING is lost save honor," Charles Schwab telegraphed to his friends when a receiver was appointed for the United Fakes Ship Building Company.—*The Whim.*

....Henry Watterson is well known for his puns. "Can you make a pun on the constellations?" asked a friend one day. "By Gemini," answered Watterson quickly, "I Cancer."—*New York Times.*

....*Friend:* "What are you going to do with all those presents? You have no family." *Smart:* "Going to send 'em to my friends in St. Louis. I'm going to the exposition next year."—*Chicago Daily News.*

...."Name the bones of the skull." The candidate for his medical degree, hesitating, stammers: "Excuse me, sir, it must be my nervousness; but for the life of me I can't remember a single one—yet I have them all—in my head."—*London Medical Press and Circular.*

....They were uttering the tender nonsense that succeeds the great question. "And," said the girl bravely, "if poverty comes we will face it together." "Ah, dearest," he replied, "the mere sight of your face would scare the wolf away." And ever since he has wondered why she returned his ring.—*The Woman's Journal.*

"Wouldst thou bound the boundless,
Set limits to the infinite,
Or seek to hold within the measure of thy cup
The waters of the Whole?
Desist, Oh, Lanoo!
Such is not the teaching of the wise."
—*January Theosophical Quarterly.*

....Stafford County also puts forward a claim for the Meanest Man. A local paper relates that he put a porcelain egg in the nest of an ambitious hen, and found that the eggs she laid were of increased size. Then he put a goose egg in the nest; the aforesaid hen laid an egg just as large. He was so pleased with the scheme that he put a white-washed football in the nest and awaited results. When he went the next time to search for eggs he found one as high as a football, but no hen in sight. Securing the egg, he saw engraved on it by the hen photography these words: "I'm no ostrich, but I have done my best." Later he found the hen inside of the egg.—*Kansas City Star.*

Green-Goods in Finance

In the New York Senate last week there was a brief debate about a pending bill permitting one-third of a corporation's directors to do business as a quorum. Some interesting remarks in opposition to this bill were made by Senator Malby, chairman of the Finance Committee, and for years past a prominent member of the Legislature. Said he:

"The corporation laws are lax enough now. Nothing has thrown such great discredit upon the finances of our country as the laxity of the corporation laws of at least one of our neighboring States, in which corporations have been organized with nothing behind them but wind and water.

"There has been such disgraceful financial manipulation upon the part of men whose financial integrity we had been led to respect as ought at least to lodge all of them in prison during the rest of their natural lives.

"The business of an ordinary highwayman who goes along and holds up his fellow citizens at night is highly respectable as compared with that of some of the great financiers of our country."

Did Senator Malby have in mind some of the financiers, attorneys and promoters connected with the organization and shameful career of the United States Shipbuilding Company? Were these the men who, in his judgment, ought to be lodged in prison for the remainder of their lives? We refer to his remarks as an indication of the drift of public opinion. For months past the reports of legal and other official inquiries concerning the Shipbuilding Company have been published and read throughout the land, until, we think, the views expressed by Senator Malby have come to be entertained quite uniformly from Maine to Texas. At the same time, from Maine to Texas there is some curiosity as to whether the accused financiers are to go scot free.

Some are asking whether the people and the authorities of the city and the State of New York (and also those of New Jersey) are willing that such men shall escape prosecution in communities where green-goods swindlers are relentlessly pursued, and where the Millers and Ammons of get-rich-quick syndicates are sent to the penitentiary. These inquiring souls have read the report of the New York Superintendent of Banks and the remarkable official statement of the Shipbuilding Company's Receiver (formerly a Senator of the United States) to the court,—a statement that, if true, contains material for a dozen prosecutions. Does any one venture to say that it is not true? Does any one assert that the Superintendent of Banks made a false report when he declared he had ascertained by official examination that prominent officers of the Trust Company of the Republic had "flagrantly transgressed the law?"

Is it unreasonable that these inquiring persons in other parts of the land should ask what are the functions of District Attorneys and grand juries in New York and New Jersey? The great money center of the New World, its trustworthy bankers, its grand financial institutions, its expanding Stock Exchange, its respected and renowned Chamber of Commerce and its honest men, cannot afford to permit the charges in this Shipyard scandal to be ignored. The publicity of official reports and legal investigation has spread them throughout the world. They cannot now be dropped or laid aside without tarnishing the good repute of American finance and exposing New York to the just comment of honest critics in our own country and abroad that men are not equal here before the law.

Literature and Science

In any scheme of higher education, as we have already remarked in two recent editorials on the question of "College English," very much will depend on the personality of the instructors. "A man must first be something," says Goethe, "before he can hope to do anything." "It matters little what your studies are," Emerson insists in his loose way, neglecting one truth in the pursuit of another; "it all lies in who your teacher is";

while of a university in particular Cardinal Newman declares that it is "a place for the communication and circulation of thought, by means of personal intercourse." But in how many of our seats of learning, we wonder, is the circulation of thought very lively or the personal influence of the faculty very inspiring. In fact, what strikes the observer of our universities most forcibly is rather the confusion of ideals, English, American, and German, under which they are laboring. Unable to settle down to one or another, or to develop an ideal of their own from the combination, they are largely engaged in a hopeless attempt to reconcile the aims of culture, the aims of industrial and professional training, and the aims of original research and investigation; while their methods of instruction waver uncertainly between lecture, recitation, text-book and laboratory. Naturally both scholarship, in the narrower sense, and professionalism suffer from the medley. Dr. Jordan affirms that "of a thousand doctors' theses each year scarcely one in a hundred contains a real addition to knowledge," and that "only a few of our professional schools to-day demand university standards." But while this is lamentable, it is not the worst. Along with this bewilderment has grown up a distrust of personality and a disposition to interpose a wall between life and learning, by which the humanities in general and English literature in particular are the worst sufferers.

For literature differs from science in being the expression of a direct personal contact with life. In science the contact, tho vital, is neither direct nor personal in the same sense. The personal element is eliminated, the field of vision is strictly limited, and the subject itself is viewed through the medium of a special method. In this way the interpretations of science are capable of an exact, an absolute formulation which reflects in its superb rigidity something of the very constitution of nature. The interpretations of literature, on the contrary, are, as compared with those of science, lax, diffuse and elastic: for life as a whole is too vague, fluctuating and discursive to adapt itself to the requirements of a formal definition. About literature there is something tentative and, as it were, freehand; and, whereas science proceeds by formulæ and equations, literature expresses its ideas in the only way in which they can be expressed—approximately, in a sort of loose descriptive phrase, which gains in intimacy, as Matthew Arnold suggests, what it loses in precision.

For this reason it is impossible to teach literature as we do a science. For the acquirement of a science consists largely in the acquirement of its method, and literature refuses to be methodized. Nor, contrary to the general opinion, can it be taught entirely from books. As a record of human thought and experience, the result of a direct personal contact with life, it requires for its interpretation not only some such free play of personality as has been instrumental in producing it, but also a knowledge of human nature and human life and a capacity for general ideas. And yet what do we see when we consider those to whose care has been confided a subject so important? A set of men, we say it with pain, whose ineptitude for life is passing into a proverb; who, so far from possessing a capacity for ideas, are content to repeat parrot-wise the information that they have acquired in their days of graduate study; whose highest flight of originality is the production of some otiose text-book or reading-text with a few verbal notes and comments. Where are the volumes of serious criticism that should be issuing from our universities, if our professors of English literature were serious in eliciting some vital significance from the subject which they are supposed to be teaching? It would be well, indeed, if they were to imitate the teachers of science in one or two essential points—if, like the latter, they would keep their eyes fastened upon the main object of pursuit and refuse to be led astray by matters of minor and secondary importance.

That Philippine Money

THE money which the United States will pay for the Friars' lands in the Philippines is seven and a quarter millions. The important question is, What will be done with it? Certain papers, like *The Catholic Citizen*, are saying, and many Catholics agree with them, that

they do not want the wealth that was given for the use of the Church of the Philippine people carried away from the Islands, and then have this country flooded with appeals for the impoverished Church.

Let us review the history of the case. The Filipinos would not allow the Spanish friars to serve longer as parish priests. There were 1,046 of them in the Islands when the Americans took possession; only 250 are left; the rest have fled the country. Of these 50 are Dominicans engaged in teaching in the cities, and may be eliminated from the problem, as also may be 50 more who are superannuated. This leaves only 150 effective friars who might take the charge of a parish if they would be received. Doubtless some would be, but the Filipinos generally are still positively opposed to any but native priests, of whom there are about six hundred, who had, under Spanish administration, been consigned to the most subordinate positions as curate assistants of friar priests. Their quality has been much criticised by the Spanish bishops and is probably not high. When the friars were driven out from the parishes these native priests took the churches and will hold them. Naturally they took the best places, and only the poorest would be left for the friars, if they were willing to accept that humiliation. At present the new American bishops are in control, but the people want also native bishops and ought to have them, if men qualified can be found, or rapidly trained. There are six vacant sees, including four newly created, and beyond doubt the American Government would be greatly pleased to have natives appointed; and it appears to be the policy of the American Archbishop and bishops to test the native priests in all the places of minor honor with a view of raising them, if found worthy, to episcopal honors. While a very large part of the Filipino people, estimated by some as high as three millions, have allied themseles more or less to the Aglipay schism, yet not more than twenty or thirty of the six hundred native priests can be counted as his followers.

But what about the seven and a quarter millions to be paid for the Friars' lands?

Our readers will remember that we strongly urged that this matter of the purchase of the friar lands should be settled directly at Rome. This was understood to be the suggestion of Archbishop Ireland, who was at favor both in Washington and in Rome. The President adopted the plan and sent Governor Taft, at the head of a Commission, to Rome, for conference with the Pope, who alone had ultimate authority. The plan has proved to be a great success. It was settled there that the land should be sold to the United States Government, altho the price was left for later decision. It was also settled that while the Pope desired the withdrawal of the body of disturbing friars, he could not order their withdrawal. Monsignor Guidi was sent to the Islands as Papal Delegate, with whom negotiations should continue. But the friars were obstinate, and put every difficulty in the way of the execution of the Pope's wishes. Knowing that they would have to sell, and fearing that they would not be able to take the money with them to Spain, they sold some of the land outright, and of the larger part they made a fictitious sale, after the manner familiar to American corporations, to a syndicate consisting of themselves. But this was not allowed at Rome. Guidi found that his powers were at first insufficient; there was delay on account of the sickness of Leo XIII, and it was not until Pius X succeeded him that positive orders came from Rome that the sale be made on reasonable terms. Governor Taft's appraisers made the value $6,000,000, and after some negotiation he consented to increase the sum by one-quarter, making it $7,500,000. It must be remembered that from the sale was excluded a large and valuable section of land for which a genuine sale had been made. The sum was reduced to $7,250,000, by excluding certain property near Manila, which the Government did not care to buy, as it was concerned only with the farming lands let to tenants. It was the Irish tenant question over again, and here, as there, the Government buys the land and the tenants buy it of the Government. The city property, churches, convents, schools, etc., the Government did not buy. Where the ownership of a church is contested the party in peaceable possession is allowed to hold it until

the rightful ownership is settled by the courts.

But now the question came up again, To whom should the money be paid? There was much anxiety here and in the Philippines on this question. Our Government could not say; it was for the Church, through its highest court at Rome, to answer that question. The friars wanted to take it with them for the support of their orders; the Filipino people declared that it was given for their use and should not leave the Islands. We have seen no statement on the subject, but we are able to state, on authority for which we can vouch, that just before Governor Taft left the Islands the Pope sent orders that the money was to be paid to the Papal Delegate, Guidi, and to be deposited by him in banks, there or here, until the question of distribution shall be determined by the Pope. This can hardly mean anything else than the defeat of the friars. We presume that some portion of the price, representing purchases made by the orders, may be paid outright to them, but the larger part, representing gifts by the Spanish Government, will be retained for the support of the Filipino Church. It is true that the people are not trained to pay anything for the support of the Church, except in the way of fees, etc., but they have no churches to build, and two hundred dollars will support a priest there as well as a thousand would here. The income of five millions would probably be ample for present necessities. With this matter settled, we look for increasing peace, at least if Governor Wright maintains Governor Taft's policy of treating the Filipinos with sympathy, as me nand equals.

Planting Forests

We have got through the century of forest cutting, and have come with bluntness against the necessity of forest planting. The wood lot is getting to be the most valuable part of a farm. What we want now to get at is not sporadic planting of trees, by school children, on Arbor Day—excellent as that work is—but we want an enlightened system, whereby our farms will be once more fairly divided between tilth and nature. Every farm of a hundred acres ought to have at least one-tenth devoted to woodland. This would be an economic measure purely from the fuel outlook. The Independent has heretofore given statistics showing that the coal era must come to an end. We do not believe that social life will react to substantially the conditions preceding our coal era, but we believe, with Professor Orton, that we shall enter a more quiet age, and that the old fire-place will constitute once more the most cheerful part of a rural home. We have no doubt that electricity or some kindred form of power, derived from sun or waterfall, will very shortly begin to operate our home industries,—doing nearly all the work on our farms, and in our houses, besides heating and lighting houses, barns and streets. A broad vision in this direction can be indulged. We are coming into a period when the population will not only be more evenly distributed over the land, but labor will be done by simpler means than man-power or animal-power.

Yet, for all this, the forest will constitute a marked feature of the future home. We have found out that climatic conditions require this, while the economics of home life demand that we shall produce our own fuel and timber. The great reserves or timber belts are being exhausted very rapidly. The farmer must produce his own logs, and cut his own fuel, as the coal age and the timber belt pass away. The wood lot pays as well as the orchard in the long run, furnishing fuel, posts, poles, lumber, and, what is still more important for the farm, shelter. There is not one feature of modern farming more important than the creation of windbreaks against severe storms and high winds. The wood lot is such a windbreak, besides furnishing its quota of usable and marketable products. Right farming produces a greater part of what it consumes,—that is its distinguishing characteristic; but protection of our gardens, orchards and field crops is where we have been peculiarly negligent. Imagine forest belts, constituting from one-twentieth to one-tenth of our whole agricultural area, and we get not only a new sort of landscape, but connected breaks against wind and storm that will add hundreds of millions to our annual products. These windbreaks will

also serve as homes for birds, who are the farmers' chief allies.

In the Eastern States few wood lots now remain on our farms. There are here and there fragments of original forest that serve for a whole neighborhood so far as fuel is concerned; yet everywhere these are fast disappearing. The undergrowth, which would soon renew the forest, is destroyed by pasturing. Horses and cattle, biting the young saplings as fast as they shoot upward, turn them into stunted dwarfs. These cumber the ground, but rarely make trees. Stock should be excluded wherever it is desirable to encourage reproduction. There are hillsides, not so common in New England, but more common as we go Westward, where natural reproduction is very rapid. Yet it is advised by the Government experts that very little reliance be placed upon renewal without first preparing the soil. Wherever the ground has been trodden and compacted for many years it is better to start another wood lot by scientific planting and culture. Our farmers will be very slow to appreciate this lesson. We hardly have seen an experiment of the sort while traveling among the farmers of the Middle States. But if natural reproduction fails, planting must be resorted to. In all cases we shall have to follow nature's plan of alternating crops. Deciduous trees generally follow where the evergreens have been burned away, and we rarely find the same variety of deciduous tree reappearing after a forest fire or after clearage by the ax.

We are advised that it will take over twelve hundred trees to plant an acre, if set at a distance of six by six feet. The cost of these young trees, including the cost of seed and seed-bed, and supervision, is estimated by our Government forester at about $2.00 per acre. At the end of forty years the land value will remain merely as at the beginning. Meanwhile it will have produced about $160, or $4.00 per acre per year. After deducting original cost and interest on money invested, it will be found that land, valueless for any other purpose, can be turned to forest, and make a return of not far from $2.00 per year per acre. This estimate is for land comparatively valueless as far as agricultural purposes are considered. It must be borne in mind that forest growing not only gives the cash return which we have specified, but that the falling leaves are constantly adding to the humus, and increasing the soil. The hillsides of New England, which are now utterly barren, were, within the memory of those now living, covered with a magnificent growth of oak, chestnut and other trees. This fertility can slowly be restored. The most economic agricultural use of lands will ultimately exhaust them for cropping, unless forestry is called in to our aid.

The States of New York, Pennsylvania and Connecticut have acquired extensive areas of non-agricultural land, which they are planting to forest as a public movement. Within the Adirondack region over sixty thousand acres of burnt-over land is being replanted. This is done at the rate of about one thousand acres per year, the Government doing its own seeding. Including what is being done by muncipalities, by corporations and by individuals of wealth, the outlook is very promising. At no preceding period was anything like the amount of work done that has been inaugurated since 1901. In Northern Minnesota a survey of one thousand acres has been made, and the planting is under way. A State Forestry Commission has been established, backed up by heavy appropriations of the Legislature. In 1901 Michigan set aside sixty thousand acres of cut-over pine land to be reforested. The estimated cost is about $8.00 per acre. These attempts on the part of the State governments to recover from the destructive tendencies of the nineteenth century cannot cover the field. Through the whole of the chief agricultural States public sentiment must be aroused, so that individual farm-forestry will be undertaken—mainly in the form of windbreaks. The land is too valuable to be devoted to timber culture on a large scale, but at the same time no farm is worth so much that it would not be worth much more with a well kept wood lot and complete windbreaks. The region to which we refer begins at the Atlantic and includes the great agricultural States, through the Ohio Valley and beyond Nebraska. Yet it is just here that it is practicable to introduce plantations

of such trees as will furnish telegraph poles and railroad ties. In fact, for this purpose large areas are now being planted to hardy catalpa, red cedar and osage orange. From Massachusetts southward the chestnut is peculiarly valuable for telegraph poles, and the black locust for posts. The subject of nut-trees deserves discussion by itself. It is enough here to say that the production of nuts for market is growing almost as rapidly as fruit-growing, while the increase of consumption of nuts in common dietary is equally rapid.

The Importance of Canadian Reciprocity

On February 4th Representative Lind, of Minnesota, made a strong speech in the House on the necessity of reciprocity with Canada. He presented evidence to show that this policy was, in his State, a Republican as well as a Democratic doctrine. On February 5th Premier Roblin, of Manitoba, carried in the Legislature of that province a strong and unanimous resolution indorsing Mr. Chamberlain's preferential tariff scheme, and urging its importance in promoting the development of the Canadian Northwest. Recently the Democratic leader in our House of Representatives, Mr. Williams, emphasized the exceptional need of Canadian reciprocity. The National Board of Trade at Washington also passed a resolution to the same effect. The great majority of the Chambers of Commerce have taken a similar attitude. The only prominent opponents of this policy are the Home Market Club, of Boston, which lately issued its usual protest, and the group of high protectionist Senators, of whom Mr. Aldrich is the leader, who have persistently blocked the Kasson treaties and repudiated the reciprocity plank in the Republican platform.

It is clear that the whole question of reciprocity with Canada is now to be considered from a different standpoint than that of a few years ago. The action of the Manitoba Legislature is a far more significant expression than Premier Laurier's indorsement of Mr. Chamberlain at the Colonial Premiers' Conference in London. The latter was an official opinion, whose future incorporation as part of the Liberal policy in Canada is yet problematical. At this moment the acceptance of Mr. Chamberlain's offer in lieu of closer commercial relations with the United States is a vital question in Canadian politics. The Liberals, who oppose a higher Canadian tariff, and the Conservatives, who favor such a tariff, are united in their eagerness to gain a preference in the British market; and the importance of reciprocity for us at this juncture is accentuated by the temporary discouragement of Mr. Chamberlain's cause in Great Britain, and the resulting greater willingness of the Dominion Government to consider reciprocity if we should offer it now.

This touches the real difficulty of the situation. The offer must come from us. Canada's export trade with Great Britain having become firmly established, there no longer exists the urgent motive which made the reciprocity missions from Ottawa to Washington assume the character of a supplication. Six of those missions, of which some of the best known Canadian statesmen were members, have exerted their energies in vain to influence Congress to a generous consideration of the Canadian case. The people of the Dominion would be likely to view further attempts in the light of a national humiliation.

The failure of those attempts and the unanimous repudiation of reciprocity by the Manitoba Legislature—for such it is—are points of departure from which the Government at Washington will be compelled to reconsider whether Canadian reciprocity should not be granted for exceptional reasons. What are these reasons? First, such a measure is needed as a convenient protection to our immense grain exports to Great Britain; secondly, the exploitation of Canadian natural resources needed in our manufactures can best be secured in this way. Canadian pulpwood, minerals, timber and the grinding of Canadian wheat in American mills, are a main part of the expected advantages under a scheme of reciproc-

ity. Broadly considered, such a scheme would prove to be the greatest annexation of profitable commerce in this country, a commerce which England would not resent, because it would enrich her chief colony, while in all human probability it would destroy the main prop of Mr. Chamberlain's prefrential scheme. Seldom has there been such an American opportunity, and it behooves Congress to embrace it before other provincial legislatures, or the Dominion Parliament itself, shall take steps which will make the repudiation of reciprocity irrevocable.

The treaty which existed from 1854 to 1866 is invariably referred to as the most conspicuous example of this kind. This is perfectly true, and the most welcome feature of its operation from an American point of view is the fact that official returns of both Canada and the United States show the balance of trade under that treaty to have been substantially in our favor. This was all the more remarkable because our demand for several classes of Canadian products was increased by the necessities of the Civil War. Why should we not now consider the Canadian provinces, to which we exported last year more goods than to all Central and South America, as a Northern tier of States where the most profitable of bargains may be made? The tiresome negotiations and fruitless argument that have been expended upon treaties with little islands and some distant countries whose trade is comparatively unimportant to us will not have been wasted if they serve to recall the claims of our nearest neighbor, racial kinsmen and third best customer.

Educational Movements in France

FRANCE never made a better bargain than when she paid Germany a billion dollars to get rid of her Emperor. A Napoleon banished still ruled in the hearts of his people; an eaglet nourished their hopes; the mere corpse of Napoleon roused to life the imperial spirit in Paris; but for a Napoleon who was a manifest failure there could be neither reverence nor following. So with the fall of the Empire fell also imperialism, and altho the national spirit of revenge which rose in its place was perhaps as bad from a moral point of view, it was not so injurious nor so lasting. Lately, as we have previously pointed out, the hereditary and cultivated spirit of hatred against Germany seems to be dying out, and the naval and colonial ambitions of new France, tho resembling what some would call imperialism in this country, are more commercial and practical than military, and aim not at glory and aggrandizement, but the benefit of both dominant and subject peoples, however ineffectively these purposes may be carried out.

For the present evils which beset or threaten France there is a tendency to blame the schools. This is a natural disposition in all countries, especially our own. School teachers are a self-conscious class of people, and delight to assemble in conventions and spend hours telling each other how much good they are doing in the world, or how much harm; it does not make much matter which view is taken, for they are equally complimentary to the importance of their vocation. Most people are anxious to get rid of responsibility, but school teachers take all that any one else is willing to lay upon their shoulders and then claim more.

But while they thus readily assume blame collectively, they refuse it individually. So, altho in France anything from the depopulation of the rural districts to corruption at the head of the army is said to be the fault of the educational system, educators do not agree there, any more than elsewhere, as to what is wrong. The Clericals say that it is the godless public schools; so they establish schools of their own. The Seculars says it is the Church schools, so they close them up. M. de Saint-Genis in his comprehensive study of "*La Propriété rurale en France*" appeals to the schools to teach practical agriculture in order to attach the people more firmly to the soil, while M. de Vogüé, as we have seen, wants to make the people more mobile that they may carry the war into Africa. According to M. Vacher de Lapouge,

"The incontestable inferiority of French culture during the nineteenth century was due to two causes: the destruction of the universities

by the Revolution, and the levity, not to say intellectual laziness, of our compatriots, who affect a superb disdain for patient and profound researches."

And Dr. Gustave Le Bon says:

"The immense scientific, industrial and economic influence of the Germans is due to the very great superiority of their methods of instruction."

The same was heard in 1871, when the French considered themselves beaten more by philologians and philosophers than by soldiers, and they resolved to adopt as much as possible of German education. But the French are not very skillful at imitation or assimilation of anything foreign. Whenever they incorporate, as they are fond of doing, a foreign word into their language, they spell it wrong and pronounce it wrong and give it a new meaning. In a similar way the new French educational system built on German models, altho admirable in many respects, was certainly not open to the charge of being a servile imitation. One important difference was due to the tendency of Latin races toward oversystemization and compulsory uniformity. In Germany, composed of many different countries imperfectly welded together, there were a dozen universities, each with a character and individuality of its own, yet nearly equal in standing, altho now, as the Government is more centralized, the University of Berlin is becoming so dominant that the situation more nearly resembles that in France, where no efforts have succeeded in making the provincial faculties rivals of the University of Paris. Uniformity of methods and text-books, which has been carried altogether too far in some of our own States, has in France gone still further, and the current is still in the same direction, as was shown by the announcement in the Chamber of Deputies last year that hereafter all the state colleges and lycées would use the same Latin and Greek grammars. This inclines one to put faith in the old story of the Minister of Public Instruction who pulled out his watch and said, "At the present moment all the children in France of a certain age are reciting this lesson."

One of the most energetic of the protestants against the crushing weight of officialism is M. Edmond Demolins, who created such a sensation a few years ago with his book, "*A quoi tient la supériorité des Anglo-Saxons?*" ("What is the Cause of Anglo-Saxon Superiority?") in which he attributed the power of the English-speaking people largely to their individualistic methods of education. He has since published a sequel with an equally awkward title, "*A-t-on interêt à s'emparer du Pouvoir?*" ("Is it Advantageous to Acquire Power?"). In this he argues with his usual epigrammatic brilliancy the thesis, not quite so new and paradoxical as he seems to think, that what are counted the periods of prosperity in history, such as the ages of Pericles, Augustus, Louis XIV and Napoleon, are really periods of decadence, in which was spent in display and luxury the capital, mental, moral and pecuniary, accumulated through the preceding obscure periods of quiet toil and individual initiative; that historians have, like children, been attracted by noise and glitter, and have almost exclusively studied and glorified persons and epochs which rather deserved contempt and condemnation.

All countries have, he says, attained their superiority through private initiative and have lost it through grasping at power, by the interference of the government in internal affairs and with foreign nations. The hereditary malady from which France is dying is politics. The state education trains public functionaries, mandarins, of which there are too many, while what is needed is practical education for farming, commerce and industrials. Between private instruction in the family by tutors on the one hand, and the great barrack-like public schools on the other, each with its peculiar evils, there is a possible intermediate type, the group of small colleges or houses in the English style, each in charge of a head master, matron and assistants, who live with them. Such a school, l'Ecole des Roches, he established in 1899 at Verneuil-sur-Avre. Among its peculiar features travel is introduced and modern languages are to be learned by a residence of three months to a year in the countries where they are spoken. Bands of students, personally conducted, have been sent out to sojourn in England and

Germany, and next year a branch of the school will be established under the ever-spreading wings of the University of Chicago.

Important modifications are being made in the curriculum of the state schools in somewhat the same direction; and after the great debate of a year ago in the Chamber of Deputies between the advocates of classical and scientific education, the latter were triumphant, and accordingly the teaching in the state schools of all grades "will be modernized." Unfortunately in this, as in almost everything else in France, politics plays a large part; and it is questionable whether this preference for the sciences and modern languages is not due more to antagonism toward the Church schools than to any well-grounded or sincere conviction of their superiority as a means of culture.

Measures now proposed by the Government will, if enacted, as they are likely to be, deprive religious bodies of the right of instruction in secondary schools altogether and give the State a legal monopoly of education.

Mr. Hanna

Typhoid is no respecter of persons. The present King of Great Britain escaped with his life at Sandringham; William H. Vanderbilt's son died at New Haven; and now Senator Hanna is passing away. Mr. Hanna came suddenly into public life, entering the Senate in 1897, and had been a business man, a manager of affairs and of men, and was a most efficient chairman of the Republican National Committee that elected his Ohio friend, Mr. McKinley. Once in the Senate, Mr. Hanna became immediately a man of the greatest influence. To be sure, he was charged with the use of illegitimate political acts, and with paying political services with office given to unworthy men; and in some cases the charge seemed to be justified. He was caricatured in the yellow press as embroidered all over with the dollar mark, and both President McKinley and himself were held up to public scorn as the corruptors of the people. But this ended when one of the dupes of the campaign of slander shot President McKinley. Then the caricatures stopped, and Mr. Hanna was discovered to be the greatest friend of the laboring man among all those in public life. He became President of the National Civic Federation, and was the trusted adviser and advised of the heads of the labor organizations. Such a revulsion of sentiment is one of the curiosities of current politics. This, among other things, has brought his name forward for the Presidency, as being acceptable to both capitalists and workingmen, and he seems to have been not quite unwilling that his claims should be pushed. The removal of this most forceful and resourceful of the leaders of the Republican Party leaves the field clear for Mr. Roosevelt at the convention in July.

Polluted Water Supplies

The illness of Senator Hanna appears to have been due to typhoid infection in the city of Columbus, where pollution of the water supply has caused an epidemic of about one thousand cases of the fever. In Ohio's capital, at the time of his great political triumph, or a short time afterward, he was poisoned, owing to the failure of the city authorities to protect either their own people or the guests whom they delighted to honor from the perils of contaminated water. It is asserted by the Secretary of the Indiana Board of Health, who recently inspected the Columbus water supply, that the introduction of typhoid germs into it was due to a slovenly method of disposing of the sewage. Large and intelligent communities are slow to learn, even from their own sad experience, how dangerous may be the effect of polluting their supplies of water. At the present time there is an epidemic (400 cases) of typhoid in Watertown, N. Y., a city of about 25,000 people. The cause, as shown by an expert sanitarian employed to make an investigation, is the pollution of the Black River, which is the source of the public supply. A few years ago Watertown suffered from a similar epidemic, and the cause of it was similar pollution of the same river. An expert authority was employed then, and his report was like the one recently made. It is strange that the city did not profit by that first inquiry and protect itself by applying the proper remedy. But other towns have been not less forget-

ful. Others have declined to be enlightened by the abundant and accessible evidence of the cost of polluted water. In no other country have the scientific investigations of typhoid epidemics been more thorough and convincing, or the results of them so widely published by the press. Still, even in University towns like New Haven and Ithaca the obvious lesson has been learned, if learned at all, only by depressing experience that might easily have been avoided.

Catholic Seminaries

What shall we do when the most contradictory statements are made to us by men who may be supposed to know what they are talking about? On the authority of information by a very intelligent and learned Catholic priest of wide knowledge, we made certain statements as to the resistance to liberal views in Catholic seminaries. They seemed to us sufficiently justified, by the criticisms of these seminaries in Dr. John Talbot Smith's book, to be plausible. We mentioned names of professors and told how they had been removed or transferred. A letter from Archbishop Ireland denied the truth of certain of the statements, and we published it. At this late date we have another letter from E. R. Dyer, D.D., President of St. Mary's Seminary, Baltimore, and Vicar General of the Sulpicians in the United States. Dr. Dyer quotes a paragraph from an editorial in our issue of November 26th, 1903, as to two Sulpician professors in St. Joseph's Seminary, Dunwoodie, N. Y., and says that certain observations that have come to his knowledge seem to make it desirable that he present the following corrections:

1. I was President of St. Joseph's Seminary, Dunwoodie, at the time Rev. Joseph Bruneau gave up the chair of Sacred Scripture to take that of Dogmatic Theology. I never heard, before reading your article, that a complaint had been made to the Archbishop by students of that institution concerning the teaching of Father Bruneau. I am sure that I would have known of such a complaint had it been made.

2. The Archbishop of New York had absolutely nothing to do with this transfer. It was arranged entirely among the members of the Dunwoodie Seminary Faculty. Not even so much as a suggestion or a criticism that might influence this change ever came from the Archbishop, either directly or indirectly, to any one concerned about it.

3. Neither in this case nor in the transfer of Rev. Dr. Henry Ayrinhae from the chair of Dogmatic Theology to that of Moral Theology, in St. Mary's Seminary, Baltimore, had the teaching of these gentlemen anything whatever to do in determining the charges made.

4. Dr. Ayrnhae never taught nor held the opinions attributed to him in this article.

The truth is all we want, wherever it hits, and we trust that this statement will be given due weight.

We have said more than once that the success of American rule in the Philippines depends on the courtesy and decency with which American officers and soldiers treat the native people. An instructive incident occurred lately in Manila. Gen. James F. Smith, a member of the Philippine Commission, was walking home late at night, when a carriage stopped near him, and the occupant, an American captain, refused to pay the driver his fare. General Smith was attracted by the disturbance and told the captain that he must pay what he owed, but the captain was noisy and attacked General Smith, and a fight between the two started, when the police came up and were about to arrest them both. But the facts were soon made clear and the captain was compelled to pay his fare. The story was noised over all Luzon that one of the Commission had so vigorously defended the rights of a poor Filipino, and it was worth a regiment of soldiers to the American cause.

The facts about the bill to forbid Berea College to admit colored students, for that is exactly what the bill before the Kentucky legislature means, are interesting. When it became known that the bill was presented meetings were held in Berea of the people and of the students. The white students and the colored voted separately, and both unanimously against the bill. President Frost and other Berea men went to Frankfort to protest. But the bill passed the House and has been unanimously reported to the Senate for passage, and will be probably passed and signed. Of course, its constitutionality will be attacked, as was the case in Florida, where a similar law was annulled by the courts.

Baltimore and Its Fire

THE Baltimore fire has passed into history. The loss and ruin that must ever be associated with the element of fire uncontrolled, approached that which characterized the great Chicago fire. The limits of the Maryland calamity are now being drawn and the insurance companies interested are finding out the exact extent of their losses, which, in many cases, have, happily for them, been below their estimates. Great as has been the destruction of property the reported loss of life has been remarkably small, only one person having been killed.

Typical Scene in Fire District

Baltimore *American* Office

Along Baltimore Street

Some of the larger losses because of the Baltimore fire fell upon the companies here named, as follows: The Continental Insurance Company, $1,135,198; North British & Mercantile, London, $1,000,000; Royal, Liverpool, $1,150,000; Sun, London, $600,000; Queen, New York, $500,000; German, Baltimore, $700,000, and the Insurance Company of North America, $500,000. The figures quoted give the amounts of insurance involved, which in adjustments are likely to be materially reduced. The first payment because of losses sustained at Baltimore, according to advices from that city, was made by the Niagara Fire Insurance Company.

Baltimore has refused outside aid and has set herself the task of rebuilding her burned district. The services of the thousands of unemployed persons are being utilized in large part in the work of clearing away the *débris* and in preparations for again rearing new buildings upon the ruins of the old ones. The new Baltimore will now have an opportunity but seldom afforded a great city to adopt plans that shall provide for the city beautiful and to rebuild along artistic as well as scientific lines. The moral of the whole matter from an insurance standpoint is that the insurance companies are established to meet just such a conflagration as that which began at Baltimore on Sunday, February 7th. As the President of one of the great companies stated:

"The losses must be paid just as a bank pays notes. This is nothing abnormal. That is what an insurance company is for. The losses of the Baltimore fire are somewhat exaggerated. The companies were intended for just such an emergency. If such an emergency never came, there would be no reason for the existence of fire insurance."

In view of the above it would seem to be absolutely imperative for any man or firm wishing to keep out of bankruptcy to insure in such well known companies as the Home, Continental, German American, Ætna, Hartford, National Fire, Springfield Fire and Marine, Williamsburg or in a dozen other as strong fire insurance companies of the country.

Insurance Statements.

EQUITABLE LIFE ASSURANCE SOCIETY OF THE UNITED STATES.

The Equitable Life Assurance Society of the United States, whose preliminary statement was published in THE INDEPENDENT of January 14th, has now issued its detailed forty-fourth annual statement. The exact amount of the company's total assets is somewhat in excess of the tentative figures given in the preliminary report, and is shown to be $381,226,035. The actual income of the company is also in excess of the provisional estimates by exactly $1,718,350 to the good. The total amount paid to policy holders during 1903 was $34,949,672, the magnitude of which is altogether beyond the comprehension of the masses. The outstanding insurance, according to the revised figures now available, is $1,409,918,742. The item of new insurance expressed in figures is $322,047,968. The President of this great company is James W. Alexander. James H. Hyde, a son of Henry B. Hyde, the founder of the Equitable, is Vice-President. Gage E. Tarbell, George T. Wilson and William H. McIntire are also Vice-Presidents. William Alexander is Secretary.

JOHN HANCOCK MUTUAL LIFE INSURANCE COMPANY, OF BOSTON, MASS.

In submitting the forty-first annual statement of the John Hancock Mutual Life Insurance Company the Directors feel that the members cannot but congratulate themselves on the continued growth and prosperity of the company. The following figures from the report in question speak for themselves: The company's income for 1903 was $13,512,851, which was an increase over the preceding year of $1,644,990. The outstanding insurance was increased $31,316,268, and the increase of surplus was $258,141. The company increased its assets during the past year by $3,957,200. During twelve months $3,666,041 was paid for death losses and matured endowments. The John Hancock is a mutual company, which means that it has no stockholders, but is operated in the sole interest of its policy holders. The company now has total admitted assets of $27,133,640. Stephen H. Rhodes is President of the John Hancock Company and Roland O. Lamb is Vice-President.

GERMANIA LIFE INSURANCE COMPANY OF NEW YORK.

The annual statement of the Germania Life Insurance Company, which was founded in 1860, shows a gain during the past year of $1,780,535 in assets, the total sum of which is now $32,476,115. The total income for 1903 was $5,656,395, as against $5,548,579 for 1902. The company's disbursements during 1903 included $1,191,129 of death claims paid. The matured endowments were $816,554; annuities, $33,566; dividends and surrenders, $530,696, or a total amount paid to policy holders during 1903 of $2,571,947. Since the organization of this company, $53,213,335 has been paid to policy holders. The principal officers of the Germania Life Insurance Company are Cornelius Doremus, President; Herbert Cillis, Vice-President, and Max A. Wesendonck Second Vice-President.

NEW ENGLAND MUTUAL LIFE INSURANCE COMPANY, OF BOSTON, MASS.

From the statement of the New England Mutual Life Insurance Company it appears that the company now has gross assets of $35,784,010, as against $34,432,217 last year. This, of course, signifies a gain of $1,351,793. The company's income from premiums, etc., for 1903 was $4,932,087, which was $369,323 in excess of the previous year. The total receipts by the company during 1903 were $6,514,660. The total disbursements for the same period were $4,812,956, or a difference in favor of the company of $701,704. The President of the New England Mutual is Benjamin F. Stevens.

GERMAN AMERICAN INSURANCE COMPANY OF NEW YORK.

The total assets of the German American Insurance Company, according to the company's annual statement just issued, are now $12,074,306. One year ago they were $10,319,176. The company has, therefore, gained $1,755,130. This is an excellent showing, and far more satisfactory than it was two years ago. The net surplus is now $5,633,249, or $937,368 in excess of last year. During 1903 the capital stock of the German American was increased from $1,000,000 to $1,500,000. William A. Kremer is President of the company.

THE WASHINGTON LIFE INSURANCE COMPANY, OF NEW YORK.

The total admitted assets of the Washington Life Insurance Company in 1902 were $16,544,578. Last year they gained $447,797, so that they now have $16,992,375. The present surplus as to policy holders, including capital stock ($125,000), is $667,649. The income of the company last year was $3,676,255, which was $94,885 in excess of last year. W. A. Brewer, Jr., is President and E. S. French Vice-President of the Washington Life.

NEW YORK FIRE INSURANCE COMPANY.

At the annual meeting of the Board of Directors of the New York Fire Insurance Company, held a few days ago, Mr. Charles A. Hull, for the past twelve years Vice-President and Secretary, was unanimously elected President. The total assets of the company, January 1st, were $511,299, and the liabilities $231,196, leaving a surplus of $280,103. This company's Baltimore losses will not exceed $20,000.

DUTCHESS INSURANCE COMPANY OF POUGHKEEPSIE, N. Y.

The sixty-eighth annual report of the Dutchess Insurance Company, of Poughkeepsie, N. Y., of which L. H. Vail is President, shows total assets of $774,121, an increase of $55,762 during the past year. The net surplus is $103,754, and the losses paid since organization are over $4,159,730.

The Independent

Vol. LVI NEW YORK, THURSDAY, FEBRUARY 25, 1904 No. 2882

Survey of the World

In the Democratic Party

Interest in the possible candidacy of Mr. Cleveland has been revived by an article contributed by him to a weekly paper, in which he urges his "rank and file associates" to unite and take advantage of their party's opportunity. He is one of those, he says, who believe there is an opportunity for Democratic success at the coming election. But the party's "fighting forces will respond listlessly and falteringly if summoned to a third defeat in a strange cause." His trust in "the patriotism and intelligence" of his fellow-countrymen is unshaken:

"This trust will not permit me to overlook the meaning of the daily increasing unrest among our people growing out of the startling and flippant abandonment by the party in power of our national traditions and maxims, its disregard of our national moral restraints, its inconsiderate tendency to set aside national good faith, its willingness to break away from safe and accustomed moorings, and its contemptuous neglect of our national mission. Surely these conditions, together with the broken pledges and forgotten promises of reform that vex the sight on every side, not only abundantly explain the popular distrust and fear prevailing everywhere in the land, but suggest that in such stress of political weather those of our fellow-citizens who thoughtfully and constantly love our free institutions will not be unmindful of such safety and quiet as may be offered them by a patriotic and conservative Democracy."

"Obsolete issues and questions, no longer challenging popular interest," he continues, "should be manfully abandoned." Tariff reform should be demanded; and "this demand should be intensified by a situation which plainly discloses the shelter and aid that existing tariff laws afford to huge monopolistic business combinations which menace the sturdiness of our citizenship by closing against the individual the door of independent industrial enterprise." In procuring an interoceanic canal, "the territorial rights of any other nation" should not be disregarded, and our national good faith should not be "subjected to reasonable suspicion." The selection of a leader "should not depend upon so small a consideration as the locality whence he comes." Some think that Mr. Cleveland here had Mr. Olney in mind.—Commenting upon this, Mr. Bryan remarked, in a speech at Atlanta, that Mr. Cleveland "would not vote for a candidate running on the ten commandments, if that candidate had not secretly mortgaged himself to Wall Street." "He says he belongs to the rank and file," Mr. Bryan added; "I admit that he belongs to the rank, but I deny that he is one of the file." Responding to this, Mr. Cleveland remarks: "Let him talk. I don't care any more about what Bryan says than the wind that blows."—In Kentucky, Henry Watterson is berating Governor Beckham for striving to send a Bryan-Hearst delegation to the convention. Mr. Bryan's hope, he says, is that, "backed by Hearst's money, he will be able to control the one-third essential to a two-thirds." Mr. Watterson virtually acknowledges that in Kentucky, where "the Hearst barrel is already on tap," the combination of the Governor with the Bryan-Hearst forces now controls the situation. It is asserted that George Fred Williams is organizing Hearst clubs in Massachusetts.—At the recent meeting of the American Newspaper Publishers' Association, a vote taken concerning the Democratic candidate and platform that would be most likely to carry New York, New Jersey, Connecticut, Indiana and Illinois, showed

a very large majority for Cleveland and the tariff and Trust issues. Reports from the South and Southwest, however, indicate bitter opposition to Cleveland. Among the published interviews is one with Congressman Cochran, of Missouri, who says he would vote for Cleveland only to keep himself out of the penitentiary.

The Hague Court Decision

The second case before The Hague Court was decided this week, Monday. The tribunal which has been considering since last autumn the claims of England, Germany and Italy, for preferential treatment of their claims against Venezuela, decided unanimously in favor of the allied Powers, and the United States was commissioned to carry out the award. Only an abstract of the decision has been cabled here, and accordingly the reasoning by which the court decided in favor of England, Germany and Italy, and against the eight "Peace Powers," is not yet absolutely clear. As near as can be judged, the court did not consider, according to the protocols on February 13th and May 7th, 1903, that it was competent to question the jurisdiction of the mixed commissions at Caracas, nor to judge of the character of the warlike operations of the blockading Powers, nor to decide if these blockading Powers had exhausted all pacific means to prevent the necessity of employing force. The tribunal was only in a position to certify that, since 1901, Venezuela refused more than once arbitration proposed by Great Britain and Germany; that after the war no formal treaty of peace was concluded; and that the blockade was stopped before the allies had received satisfaction for all their claims. In adhering to the protocols and referring the case to The Hague, the allies could not have intended to renounce their acquired rights nor their privileged *de facto* position, and Venezuela, moreover, had recognized the well foundedness of their claims by constantly distinguishing during the negotiations at Washington between the allies and the "Peace Powers," and that the Peace Powers had not protested either during the siege or immediately after against the allies' claims. The President of the Court, M. Muravieff, after the reading of the decision, made a short speech, in which he said that "like all human acts the decision was susceptible to criticism, but that the findings had been reached only after the most minute and impartial investigation." He added that every one should accept it, now that it was made, and concluded by saying that The Hague Tribunal "remains always, the rampart of justice, truth and reason, and the sublime hope of the future." In Washington a feeling of keen disappointment has arisen over the award on the grounds given in our editorial pages.

Washington Topics

The contest between John F. Shafroth (Democrat) and Robert W. Bonynge (Republican) for the right to represent one of the Denver districts in the House, was ended on the 15th by the public withdrawal and resignation of Mr. Shafroth, who was holding the seat, after serving four consecutive terms. The committee had taken much testimony, but had not made a report. Mr. Shafroth rose in his place and said he could not conscientiously retain the seat. He had recently examined the ballots cast at the election, and the confessions of those who committed the frauds. To his sore disappointment the evidence against his claim was conclusive. If he were a judge on the bench, he should be compelled to find that Mr. Bonynge was entitled to the place. At his suggestion, a resolution giving the seat to Bonynge was at once prepared and passed. Members without regard to party cheered Mr. Shafroth. The contestant had not charged that he had had any knowledge of the frauds. It is shown by the evidence that several women voters, whose sworn admissions are given, were actively interested in the frauds, having padded the poll lists, bought votes and stuffed the ballot boxes. As members of the Legislature elected by these frauds voted for Senator Teller, some think that his title is no better than Shafroth's was.—The House Committee on Territories will probably recommend that Oklahoma and Indian Ter-

ritory be admitted as one State, after the Indian allotments are completed, and that another State be formed by a union of New Mexico and Arizona. It is expected that the first of the new States will be Democratic and the second Republican.—The nomination of Dr. Crum to be Collector of the port of Charleston has at last been reported favorably, but confirmation will be sharply opposed in the Senate.—In the debate on the Fortifications bill, in the House, the Democrats sought in vain to prevent the use of any part of the money for works in the Philippines, holding that the United States ought not to pursue a policy indicating a purpose to retain the islands in perpetuity. The Democrats were not united, however, in opposing the expenditures projected in the Naval bill, those not objecting being represented in the discussion by Mr. Meyer, of Louisiana.—The Post Office bill, appropriating $170,000,000 (an increase of $16,500,000), raises the pay of rural carriers to $720 and forbids them to solicit business, receive orders, or carry merchandise for hire. —The demurrer of Senator Burton, accused of taking pay for exercising his influence to prevent the issue of a fraud order by the Post Office Department against an investment company, has been overruled, and he will be tried on March 22nd.—Additional indictments against John A. Benson and several men associated with him in extensive land frauds have been found by a Washington grand jury. The confessions of clerks and Federal officers are a part of the evidence.—Perry S. Heath, on the 20th, in a telegram from Cleveland, resigned the office of Secretary of the Republican National Committee, owing, he said, to Mr. Hanna's death. His resignation was at once accepted.

The Isthmian Canal

It was agreed in the Senate, last week, that final action upon the Panama Canal treaty should be taken on the 23d. The latest count indicated that the treaty would be ratified by a vote of 71 to 17, 15 Democrats joining the Republicans in the affirmative. An amendment proposed in executive session by Mr. Bacon empowers the United States, acting for itself and for Panama, to treat with Colombia and to agree with that country concerning a sum to be paid in their behalf in full satisfaction of all Colombian claims as to sovereignty on the Isthmus, canal concessions, interest in canal or railroad, and loss alleged to have been caused by the Isthmian revolution. On the 20th, Mr. Morgan delivered in the Senate a speech which, he said, was his last on this subject. It is now expected that new legislation will be enacted authorizing the payment of $10,000,000 to Panama and creating a special commission for the government of the canal zone.—Panama's new Constitution was officially promulgated on the 15th, and Dr. Manuel Amador was unanimously elected President. Five days later he was inaugurated in the plaza and near the cathedral. The three Designados, or Vice-Presidents in possible succession, are Pablo Arosemena, Domingo Obaldia and Carlos Mendoza. President Amador's Cabinet is composed of two Liberals and two Conservatives. The Constitution excludes Chinese after January 1st, 1905.—At last reports the result of the Presidential election was not yet known at Bogota. Private letters have predicted the election of Joaquin Velez, with Velasquez Cobo (now Minister of War) Vice-President. It is said that in the absence of General Reyes, his supporters have been overcome by the influence of the present Government in favor of Velez, a man of 71 years, known as the leader of the anti-foreign forces. The purpose of Velez, it is asserted, has been to irritate the United States by confiscating the property of our citizens who reside in Colombia or have made investments there in railways, steamships and mines. So great is the depreciation of the currency that a dollar in gold will buy $140 in paper. The longshoremen at Savanilla recently went on strike for an increase of their wages from $130 to $140 a day. Five-dollar bills are the smallest in circulation, and each of them is worth less than 4 cents in gold.

Trusts and Tariffs

At the meeting, last week, of the American Newspaper Publishers' Association there was adopted unanimously a resolu-

tion requesting the President and Attorney-General Knox to bring suit under the Sherman act against the combinations which control the supply of the paper used by daily journals. It was also decided to raise a fund of $100,000 to promote agitation for release from the oppression of these combinations, and for a reduction of the tariff on pulp and paper. In the speeches that were made it was asserted that the controlling combination had reduced and restricted its output, largely increased the cost of paper, imperiled the business of newspaper publishers by ignoring their reasonable demands for an unfailing and adequate supply, and sold paper abroad at prices much lower than those exacted at home. —It appears to have been decided at Albany that after the adjournment of the New York Legislature there shall be an investigation of the Shipyard Trust scandal by a special committee. Senator Malby will probably be the committee's chairman. District Attorney Jerome has been examining the evidence, to ascertain, it is said, whether he ought to ask for the indictment of persons accused of violating the laws in connection with this corporation.—In the House, at Washington, Mr. Wade, of Iowa, asserted, last week, that there was abundant evidence of the violation of the restraining injunctions by the Beef Trust. He attacked Attorney-General Knox for failing to proceed against the associated corporations against which the injunctions were issued.—Mr. Spalding (Republican), of North Dakota, has introduced a resolution directing the Department of Commerce and Labor to make an investigation as to the sale in Canada and other foreign countries of farm machinery and other iron or steel products, by our manufacturers at prices much lower than those which American buyers are required to pay. The preamble of this resolution raises the question whether the present tariff is not too high for the welfare of the American people.

The Islands Corporal Ayala, leader of the revolt in the Philippine Constabulary garrison at Vigan, has been caught, tried and sentenced to be hanged. For the capture of Ricarte, the insurgent agitator, a reward of $2,500 has been offered.—While patrolling the east coast of Samar last week Lieutenant McRae and six privates of the Constabulary were killed by an attacking party of 500 fanatics. —W. Cameron Forbes, of Boston, has accepted the President's offer of the vacant place in the Philippine Commission, and his nomination has been confirmed in the Senate.—In the House, Mr. Crumpacker has introduced bills to carry out the recommendations of Governor Taft and the Commission that the Philippine Government be authorized to issue $5,000,000 for public improvements, and that a corporation may own 25,000 acres of land, instead of only 2,500, as provided by existing law. Amendments to the Frye bill (which would apply the coastwise navigation laws to trade between the Philippines and the States after June next) have been proposed in the Senate by Mr. Carmack. They defer such a use of the laws until 1909, and forbid further discrimination against foreign buyers by the rebate of export taxes now made in favor of American buyers of Philippine hemp.—Reports have been received to the effect that the new Bishop of Jaro (Monsignor Rooker, formerly of Washington) recently took possession, virtually by force and with the aid of armed Americans, of a church near Iloilo, which had been claimed and held by the Aglipay faction. It is said that Bishop Dougherty, in the north, has obtained possession of church property in a similar way.— By a vote of 27 to 23, the Senate has refused to pass a bill giving $200,000 to Liliuokalani, the former Queen of Hawaii, in satisfaction of her claims with respect to the Crown lands.—In Porto Rico, on the 20th, the Assembly, by a vote of 60 to 15, demanded that the island be admitted to the Union as a State, or be allowed to set up an independent Government.—The bonds of the new Cuban loan of $35,000,000, which was awarded to Speyer & Co., of New York, at 90½, have been very easily placed with a syndicate, including the great life insurance companies of New York, prominent banks and financial institutions of Berlin and

Paris. The demand exceeded the supply. Sales have been made in Havana at 96½.

Santo Domingo

On Monday of this week it was learned for the first time that a clash had occurred between the Santo Domingo insurgents and American marines on February 12th. It seems that a stray shell fired by the insurgents hit the deck of the Clyde Line steamer "New York" as she was engaged in discharging her cargo at the wharves. Thereupon the cruiser "Newark" shelled the insurgent camp and subsequently she and the "Columbia" landed 400 marines, who, after a three hours' skirmish, drove the insurgents to the woods and captured some of their artillery. The skirmish could not have been a particularly bloody one, for no insurgents are reported to have been killed, and it is known that none of the American forces were injured in the least. Subsequent to this the insurgents and the Government forces met in several important engagements outside the city, in which in every case the insurgents were forced to retire. It is now said that the insurgents are entirely without ammunition. This clash between the Dominicans and American troops is, of course, the subject of wide comment at Washington. All sorts of rumors are afloat as to the possible future action of the administration. There is no doubt that the islands are in a desperate condition, that they apparently have no leader to raise them out of their state of "chronic deviltry," and that their commercial and political international obligations have been wantonly disregarded. The State Department officially denies that there is any intention to take more drastic measures than our naval officers would be compelled to take on the grounds of common sense and international law. In other words, the United States has no intention of making a protectorate over Santo Domingo, let alone annexing it. While any move that would render commerce and trade stable would be heartily welcomed by the commercial interests of the islands even if that move should be annexation, still there is little doubt but that the population of the island as a whole would fight rather than submit to any foreign Power. In the meantime, however, it is reported that Assistant Secretary of State Loomis, who has just left for the West Indies ostensibly to witness the winter maneuvers of the American fleet, is in reality going to Santo Domingo to investigate the situation there for the State Department. It is evident that the State Deuartment is more than loath to take any severe measures if they can be avoided, but the country is not going to get caught unprepared if possible.

The Nozaleda Incident

The attack on the Spanish Premier, Señor Maura, for his appointment of Father Nozaleda as Archbishop of Valencia, seems to be one of those Parliamentary motions which "open the previous question for debate," for it has become the pretext for a general discussion of the conduct of the Spanish-American War and the methods of colonial administration in vogue previously. Father Nozaleda is a Dominican friar, and was Archbishop of Manila at the outbreak of the war, when he issued the notorious proclamation to arouse the Filipinos against the barbarian invaders who had come to ravage their homes. He played an important and, according to the charges now made by his enemies, a disgraceful part in the negotiations which led to the surrender of Manila, and was afterward so friendly to the Americans as to be accused of lack of patriotism. The Government is charged with being reactionary and subservient to clerical interests and unduly dominated by the Crown in thus selecting for an important post a friar, and one who is held by public opinion as largely responsible not only for an humiliating surrender, but also for the abuses which alienated the Filipino people. More than 50 mass meetings have been held to protest against the appointment, and there have been riots at Valencia, in which the soldiers so far sympathized that they disobeyed the commands of their officers to fire on the mob; conduct for

which they were commended by Señor Soriano in the Chamber. Señor Maura declares that Father Nozaleda shall go to Valencia even if he has to enter the place between a hedge of bayonets, and he is holding together the Cabinet at all costs to carry through his purpose. The Naval Reconstructional bill has now been somewhat modified in conformity with the criticisms made upon it, and it now aims more for the construction of arsenals and coaling stations at such points as Cartagena and Carraca than for the building of large war ships, which would be useless without ports for shelter and repair.—The sudden mobilizing of the Spanish army and the calling in of reserves and despatch of troops to the Balearic Islands led to rumors of a general European war and produced a panic on the Paris Bourse. The Spanish Government apparently fears the seizure by Great Britain or some other nation of the Canary or Balearic Islands or of a coast port.

The Albanian Revolt

"There will be trouble in the Balkans in the spring" is an easy and safe prophecy, but there is always a good deal of uncertainty about the exact form the trouble will take. This time it is an outbreak of the Albanians in the District of Diakava, Province of Ipek. Shemsi Pasha, with 2,500 Turkish troops and three guns, was besieged in Babajhosi by some 16,000 to 20,000 Albanians. The Turks were without food and water and in great danger of being annihilated, but on the arrival of reinforcements the Albanians were routed with the loss of 800 men. The Turks also lost heavily. It is reported that Shemsi Pasha has been deposed by the Sultan.—Whatever may be the cause of this rebellion, it is probably not at all displeasing to the Sultan, because it enables him to postpone indefinitely the reforms in administration forced on him by the Powers, and gives an excuse for the extensive mobilization of troops which has been going on for some time in Macedonia. In spite of all denials of the Porte, it is evident that a large force of men has been collected along the Bulgarian frontier to prevent an invasion of Macedonia by that country, which is likely to occur as soon as the weather will permit—that is, in about six weeks.—In Bulgaria Dr. Daneff, who has been at the head of a pro-Russian and peace cabinet, has been dismissed, and his place taken by General Petroff, who is actively engaged in reorganizing the army, by means of the extraordinary military appropriation of $5,000,000 recently voted for that purpose. Six squadrons of cavalry, seven companies of pioneers and one railway company are to be added to the army, which will then consist of 2,519 officers and 200,000 men. —The warlike disposition of the Bulgarians is constantly stimulated by the presence in their country of 11,500 Christian refugees from Macedonia, most of whom are in a state of extreme destitution and suffering from starvation and disease, in spite of the fact that the Bulgarian Government has appropriated $100,000 for their relief.—Whether the Albanian revolt is part of a concerted plan for a general uprising in the Balkans or only a sporadic insurrection of this turbulent people, cannot yet be determined. In 1898 they almost succeeded in establishing their national independence and were brought into nominal subjection to Turkish rule only after a brave resistance. In fact, these liberty-loving mountaineers have never been thoroughly conquered, but have remained unassimilated from ancient times by the Greek, Roman, Byzantine and Ottoman empires which have surrounded them. Under a second Scanderbeg they might make as strong a fight against the Turks as they did in the fifteenth century.—Ipek, where the revolt centered, is about 120 miles northwest of Monastir, the scene of the disturbances of last summer.

The British in Tibet

For the first time now we are able to study the causes which led to the sending of a British military expedition in the dead of winter into the forbidden and forbidding land of Tibet through passes nearly as high as Mont Blanc or Pike's Peak. If the two series of events are entirely unrelated, the synchronism in the happenings in Eastern and those in Central Asia is certainly curious. When Japan began to show a belligerent attitude toward Russia, England

found that her grievances against Tibet had become unendurable. While Japan and Russia were preparing for war, the British Mission entered Tibet and encamped in the Chumbi Valley, and the nearer war approached, the nearer the English approached Lhasa. The negotiations with Russia, which preceded the invasion, are now published in a recent "blue-book," and it appears from this that it was definitely planned over a year ago, for on January 8th, 1903, the Indian Government proposed to the Home Government that China should be informed that the points at issue will be negotiated nowhere else than at Lhasa; that a commercial expedition start for that capital in the spring; that the discussion include not merely the question of the frontier determination, but "the entire question of our future relations, commercial and otherwise, with Tibet"; that the ultimate aim should be nothing short of the establishment of free trade between India and Tibet, and the residence of a British representative at Tibet. Up to this Russia had disclaimed any interest in Tibet, but the preparations for the expedition called out on February 2d, 1903, the following very remarkable protest:

"In view of the very great importance which the Imperial Russian Government attaches to the avoidance of any cause of trouble in China, it would consider such an expedition into Tibet as calculated to produce a situation of considerable gravity, which might eventually force the Russian Government to take measures for the protection of its interests in those regions."

In reply to this threatening note, Lord Lansdowne expressed surprise that Russia, whose nearest point is over 1,000 miles from Tibet, should be concerned with the relations of India to her neighbor on the north, and in return called the attention of the Russian Ambassador to the rumors of the establishment of Russian agents or consular officers in Tibet and even of a Russian protectorate over the country; concluding with these emphatic words:

"I went on to say that, as we were much more closely interested than Russia in Tibet, it followed that, should there be any display of Russian activity in that country, we should be obliged to reply by a display of activity not only equivalent, but exceeding that made by Russia. If they sent a mission or an expedition we should have to do the same, but in greater strength."

The Russian Government responded by declaring the rumors absolutely without foundation, but that they could not remain indifferent to any disturbance of the *status quo* of Tibet, for they regarded it "as forming a part of the Chinese Empire, in the integrity of which they took an interest." Considering the encroachments of Russia on Chinese integrity in Manchuria, this last clause is interesting reading. Colonel Younghusband, when he entered Tibet with the Mission, reported that Dorjieff, a Russian emissary, resided at Lhasa in close touch with the Dalai Lama, and that the Tibetans considered themselves assured of Russian support.

The Russian Sea Power

From the time when Peter the Great changed the capital from inland Moscow to St. Petersburg on the coast it has been the ambition of Russia to become a sea Power, and to this end she has made every effort to secure open ports and to build up a great navy. Yet, in spite of all this expenditure, she has never been able to maintain an efficient force on the sea, and at the very beginning of a war, for which she has so long prepared, the naval part of the operations seems to be already abandoned. In the Crimean War Russia could find no better use for her great battle ships than to sink them across the mouth of the harbor of Sevastopol, as the "Merrimac" was sunk at Santiago, to keep out the English, and she may put them to the same use at Port Arthur, tho the Japanese seem to be doing it for her. The "Retvizan" still lies where she sank and is being used as a rampart. The "Novik" has been docked and repaired. —There is no prospect of any reinforcement to the Port Arthur fleet. The Black Sea fleet cannot pass the Dardanelles without the permission of England, and it is doubtful if that will even be asked. The ships in the Baltic would probably not be allowed by Germany to go through the Kiel Canal and they are not of much value anyway. The Mediterranean fleet, which passed through the Suez Canal in such close pusuit of the two Japanese

cruisers, stopped at Djibutil, a French port in Somaliland, longer than international law allows a ship of war to stay in a neutral port, and France has had to make very elaborate explanations of the delay, which are declared satisfactory by the Japanese. The fleet has been ordered to Cronstadt and is probably already passing through the Suez Canal on its way back to the Baltic. Under the neutrality laws a ship can only receive coal enough from a neutral port to carry her to her nearest home port, and cannot again visit a port of the same nation for three months; therefore the Russians could not coal at two French ports without making France a belligerent Power, and could not reach the Far East without coal depots. The Russian gunboat "Mandjur," which has been in the harbor of Shanghai since the outbreak of the war, has been ordered to leave by the Chinese at the demand of the Japanese steamship companies using that port. As she is unable to do this without great risk of being captured by the Japanese cruisers, she will probably be disarmed and put out of commission. —The Russian cruiser "Boyarin" is reported to have been wrecked in Port Arthur harbor either by running against one of the mines which were left in the harbor by the "Yenisei" or being driven on the rocks by the storm.—The Japanese have declared both coal and food for the garrison at Port Arthur contraband of war, and if this is enforced it will practically put Port Arthur in a state of siege.

The War on Land

The theory that Russia has practically abandoned naval operations receives support from the news that Harbin and not Port Arthur is to be made headquarters in Manchuria and that the Viceroy Alexiff is already establishing there the administrative offices in the expectation that communication with Port Arthur may be cut off at any time. Harbin is a new commercial town, created by the Russians since their occupation, and is the railroad center of Manchuria. To reach it will probably require months of hard fighting on the part of the Japanese, if, indeed, they are able in any case to carry on a successful campaign in a country where cavalry are so important. The Japanese are not good horsemen and their ponies are said to be in very poor condition, while in the Cossacks the Russians have the best natural cavalry in the world, with the possible exception of our Western rough-riders.—The Viceroy Alexieff is to be relieved of the command of the land forces in Manchuria, whether at his own request or as punishment for his laxity in the defense of Porth Arthur is not known, and General Kuropotkin, who has been Minister of War, is given charge of the Russian army in the Far East. He will be accompanied by the Grand Dukes Boris, Alexis, Nicholas and Michael Mikolaievitch. General Kuropotkin will be nominally under the authority of the Viceroy, but will communicate directly with the Czar.—So far no correspondents have been allowed in either army and the movements of the troops can only be guessed at. No important land battles have been fought. The Russian troops are concentrated on the Manchurian side of the Yalu, and a small party scouting on the Korean side reported no Japanese forces near the Yalu, altho they captured a Japanese picket guard stationed there and secured some valuable maps and papers.

Women in German Universities

In school circles nothing has caused a greater surprise than the unexpected declaration of the Bavarian Government that henceforth women will be admitted on equal terms with the men at its three territorial universities of Munich, Erlangen and Freiburg. Bavaria is thus the second State to take this step, the first being Baden, which opened its two universities of Heidelberg and Freiburg to women about two years ago. Prussia, however, as yet shows no signs of yielding in this matter. Evidently Germany will soon have its twenty-third university in its business metropolis in Hamburg. The Senate of that town has for several years arranged extensive series of university lectures very winter. During the coming winter arrangements have been made for 119 courses by 97 docents, of whom quite a number are university men. During the last winter the total number of attendants at these courses was 10,720, of whom 3,830 were women.

The New Slavery in the South—An Autobiography

BY A GEORGIA NEGRO PEON

[The following article was secured by a representative of THE INDEPENDENT specially commissioned for this work. It is a reliable story, and, we believe, a typical one. It was dictated to our representative, who took the liberty to correct the narrator's errors of grammar and put it in form suitable for publication.—EDITOR.]

I AM a negro and was born some time during the war in Elbert County, Ga., and I reckon by this time I must be a little over forty years old. My mother was not married when I was born, and I never knew who my father was or anything about him. Shortly after the war my mother died, and I was left to the care of my uncle. All this happened before I was eight years old, and so I can't remember very much about it. When I was about ten years old my uncle hired me out to Captain ———. I had already learned how to plow, and was also a good hand at picking cotton. I was told that the Captain wanted me for his house-boy, and that later on he was going to train me to be his coachman. To be a coachman in those days was considered a post of honor, and, young as I was, I was glad of the chance. But I had not been at the Captain's a month before I was put to work on the farm, with some twenty or thirty other negroes—men, women and children. From the beginning the boys had the same tasks as the men and women. There was no difference. We all worked hard during the week, and would frolic on Saturday nights and often on Sundays. And everybody was happy. The men got $3 a week and the women $2. I don't know what the children got. Every week my uncle collected my money for me, but it was very little of it that I ever saw. My uncle fed and clothed me, gave me a place to sleep, and allowed me ten or fifteen cents a week for "spending change," as he called it. I must have been seventeen or eighteen years old before I got tired of that arrangement, and felt that I was man enough to be working for myself and handling my own wages. The other boys about my age and size were "drawing" their own pay, and they used to laugh at me and call me "Baby" because my old uncle was always on hand to "draw" my pay. Worked up by these things, I made a break for liberty. Unknown to my uncle or the Captain I went off to a neighboring plantation and hired myself out to another man. The new landlord agreed to give me forty cents a day and furnish me one meal. I thought that was doing fine. Bright and early one Monday morning I started for work, still not letting the others know anything about it. But they found it out before sundown. The Captain came over to the new place and brought some kind of officer of the law. The officer pulled out a long piece of paper from his pocket and read it to my new employer. When this was done I heard my new boss say:

"I beg your pardon, Captain. I didn't know this nigger was bound out to you, or I wouldn't have hired him."

"He certainly is bound out to me," said the Captain. "He belongs to me until he is twenty-one, and I'm going to make him know his place."

So I was carried back to the Captain's. That night he made me strip off my clothing down to my waist, had me tied to a tree in his backyard, ordered his foreman to give me thirty lashes with a buggy whip across my bare back, and stood by until it was done. After that experience the Captain made me stay on his place night and day,—but my uncle still continued to "draw" my money.

I was a man nearly grown before I knew how to count from one to one hundred. I was a man nearly grown before I ever saw a colored school teacher. I never went to school a day in my life. To-day I can't write my own name, tho

I can read a little. I was a man nearly grown before I ever rode on a railroad train, and then I went on an excursion from Elberton to Athens. What was true of me was true of hundreds of other negroes around me—'way off there in the country, fifteen or twenty miles from the nearest town.

When I reached twenty-one the Captain told me I was a free man, but he urged me to stay with him. He said he would treat me right, and pay me as much as anybody else would. The Captain's son and I were about the same age, and the Captain said that, as he had owned my mother and uncle during slavery, and as his son didn't want me to leave them (since I had been with them so long), he wanted me to stay with the old family. And I stayed. I signed a contract—that is, I made my mark—for one year. The Captain was to give me $3.50 a week, and furnish me a little house on the plantation—a one-room log cabin similar to those used by his other laborers.

During that year I married Mandy. For several years Mandy had been the house-servant for the Captain, his wife, his son and his three daughters, and they all seemed to think a good deal of her. As an evidence of their regard they gave us a suit of furniture, which cost about $25, and we set up housekeeping in one of the Captain's two-room shanties. I thought I was the biggest man in Georgia. Mandy still kept her place in the "Big House" after our marriage. We did so well for the first year that I renewed my contract for the second year, and for the third, fourth and fifth year I did the same thing. Before the end of the fifth year the Captain had died, and his son, who had married some two or three years before, took charge of the plantation. Also, for two or three years, this son had been serving at Atlanta in some big office to which he had been elected. I think it was in the Legislature or something of that sort—anyhow, all the people called him Senator. At the end of the fifth year the Senator suggested that I sign up a contract for ten years; then, he said, we wouldn't have to fix up papers every year. I asked my wife about it; she consented; and so I made a ten-year contract.

Not long afterward the Senator had a long, low shanty built on his place. A great big chimney, with a wide, open fireplace, was built at one end of it, and on each side of the house, running lengthwise, there was a row of frames or stalls just large enough to hold a single mattress. The places for these mattresses were fixed one above the other; so that there was a double row of these stalls or pens on each side. They looked for all the world like stalls for horses. Since then I have seen cabooses similarly arranged as sleeping quarters for railroad laborers. Nobody seemed to know what the Senator was fixing for. All doubts were put aside one bright day in April when about forty able-bodied negroes, bound in iron chains, and some of them handcuffed, were brought out to the Senator's farm in three big wagons. They were quartered in the long, low shanty, and it was afterward called the stockade. This was the beginning of the Senator's convict camp. These men were prisoners who had been leased by the Senator from the State of Georgia at about $200 each per year, the State agreeing to pay for guards and physicians, for necessary inspection, for inquests, all rewards for escaped convicts, the costs of litigation and all other incidental camp expenses. When I saw these men in shackles, and the guards with their guns, I was scared nearly to death. I felt like running away, but I didn't know where to go. And if there had been any place to go to, I would have had to leave my wife and child behind. We free laborers held a meeting. We all wanted to quit. We sent a man to tell the Senator about it. Word came back that we were all under contract for ten years and that the Senator would hold us to the letter of the contract, or put us in chains and lock us up—the same as the other prisoners. It was made plain to us by some white people we talked to that in the contracts we had signed we had all agreed to be locked up in a stockade at night or at any other time that our employer saw fit; further, we learned that we could not lawfully break our contract for any reason and go and hire ourselves to somebody else without the consent of our employer; and, more than that, if we got mad and

ran away, we could be run down by bloodhounds, arrested without process of law, and be returned to our employer, who, according to the contract, might beat us brutally or administer any other kind of punishment that he thought proper. In other words, we had sold ourselves into slavery—and what could we do about it? The white folks had all the courts, all the guns, all the hounds, all the railroads, all the telegraph wires, all the newspapers, all the money, and nearly all the land—and we had only our ignorance, our poverty and our empty hands. We decided that the best thing to do was to shut our mouths, say nothing, and go back to work. And most of us worked side by side with those convicts during the remainder of the ten years.

But this first batch of convicts was only the beginning. Within six months another stockade was built, and twenty or thirty other convicts were brought to the plantation, among them six or eight women! The Senator had bought an additional thousand acres of land, and to his already large cotton plantation he added two great big saw-mills and went into the lumber business. Within two years the Senator had in all nearly 200 negroes working on his plantation—about half of them free laborers, so-called, and about half of them convicts. The only difference between the free laborers and the others was that the free laborers could come and go as they pleased, at night—that is, they were not locked up at night, and were not, as a general thing, whipped for slight offenses. The troubles of the free laborers began at the close of the ten-year period. To a man, they all wanted to quit when the time was up. To a man, they all refused to sign new contracts—even for one year, not to say anything of ten years. And just when we thought that our bondage was at an end we found that it had really just begun. Two or three years before, or about a year and a half after the Senator had started his camp, he had established a large store, which was called the commissary. All of us free laborers were compelled to buy our supplies—food, clothing, etc.—from that store. We never used any money in our dealings with the commissary, only tickets or orders, and we had a general settlement once each year, in October. In this store we were charged all sorts of high prices for goods, because every year we would come out in debt to our employer. If not that, we seldom had more than $5 or $10 coming to us—and that for a whole year's work. Well, at the close of the tenth year, when we kicked and meant to leave the Senator, he said to some of us with a smile (and I never will forget that smile—I can see it now):

"Boys, I'm sorry you're going to leave me. I hope you will do well in your new places—so well that you will be able to pay me the little balances which most of you owe me."

Word was sent out for all of us to meet him at the commissary at 2 o'clock. There he told us that, after we had signed what he called a written acknowledgment of our debts, we might go and look for new places. The storekeeper took us one by one and read to us statements of our accounts. According to the books there was no man of us who owed the Senator less than $100; some of us were put down for as much as $200. I owed $165, according to the bookkeeper. These debts were not accumulated during one year, but ran back for three and four years, so we were told—in spite of the fact that we understood that we had had a full settlement at the end of each year. But no one of us would have dared to dispute a white man's word—oh, no; not in those days. Besides, we fellows didn't care anything about the amounts—we were after getting away; and we had been told that we might go, if we signed the acknowledgments. We would have signed anything, just to get away. So we stepped up, we did, and made our marks. That same night we were rounded up by a constable and ten or twelve white men, who aided him, and we were locked up, every one of us, in one of the Senator's stockades. The next morning it was explained to us by the two guards appointed to watch us that, in the papers we had signed the day before, we had not only made acknowledgment of our indebtedness, but that we had also agreed to work for the Senator until the debts were paid by hard labor. And from that day forward we were treated just like convicts. Really we had

made ourselves lifetime slaves, or peons, as the laws called us. But, call it slavery, peonage, or what not, the truth is we lived in a hell on earth what time we spent in the Senator's peon camp.

I lived in that camp, as a peon, for nearly three years. My wife fared better than I did, as did the wives of some of the other negroes, because the white men about the camp used these unfortunate creatures as their mistresses. When I was first put in the stockade my wife was still kept for a while in the "Big House," but my little boy, who was only nine years old, was given away to a negro family across the river in South Carolina, and I never saw or heard of him after that. When I left the camp my wife had had two children for some one of the white bosses, and she was living in fairly good shape in a little house off to herself. But the poor negro women who were not in the class with my wife fared about as bad as the helpless negro men. Most of the time the women who were peons or convicts were compelled to wear men's clothes. Sometimes, when I have seen them dressed like men, and plowing or hoeing or hauling logs or working at the blacksmith's trade, just the same as men, my heart would bleed and my blood would boil, but I was powerless to raise a hand. It would have meant death on the spot to have said a word. Of the first six women brought to the camp, two of them gave birth to children after they had been there more than twelve months—and the babies had white men for their fathers!

The stockades in which we slept were, I believe, the filthiest places in the world. They were cesspools of nastiness. During the thirteen years that I was there I am willing to swear that a mattress was never moved after it had been brought there, except to turn it over once or twice a month. No sheets were used, only dark-colored blankets. Most of the men slept every night in the clothing that they had worked in all day. Some of the worst characters were made to sleep in chains. The doors were locked and barred each night, and tallow candles were the only lights allowed. Really the stockades were but little more than cow lots, horse stables or hog pens. Strange to say, not a great number of these people died while I was there, tho a great many came away maimed and bruised and, in some cases, disabled for life. As far as I remember only about ten died during the last ten years that I was there, two of these being killed outright by the guards for trivial offenses.

It was a hard school that peon camp was, but I learned more there in a few short months by contact with those poor fellows from the outside world than ever I had known before. Most of what I learned was evil, and I now know that I should have been better off without the knowledge, but much of what I learned was helpful to me. Barring two or three severe and brutal whippings which I received, I got along very well, all things considered; but the system is damnable. A favorite way of whipping a man was to strap him down to a log, flat on his back, and spank him fifty or sixty times on his bare feet with a shingle or a huge piece of plank. When the man would get up with sore and blistered feet and an aching body, if he could not then keep up with the other men at work he would be strapped to the log again, this time face downward, and would be lashed with a buggy trace on his bare back. When a woman had to be whipped it was usually done in private, tho they would be compelled to fall down across a barrel or something of the kind and receive the licks on their backsides.

The working day on a peon farm begins with sunrise and ends when the sun goes down; or, in other words, the average peon works from ten to twelve hours each day, with one hour (from 12 o'clock to 1 o'clock) for dinner. Hot or cold, sun or rain, this is the rule. As to their meals, the laborers are divided up into squads or companies, just the same as soldiers in a great military camp would be. Two or three men in each stockade are appointed as cooks. From thirty to forty men report to each cook. In the warm months (or eight or nine months out of the year) the cooking is done on the outside, just behind the stockades; in the cold months the cooking is done inside the stockades. Each peon is provided with a great big tin cup, a flat tin pan and two big tin spoons. No knives or forks are ever seen, except those used by the cooks. At meal time the peons

pass in single file before the cooks, and hold out their pans and cups to receive their allowances. Cow peas (red or white, which when boiled turn black), fat bacon and old-fashioned Georgia corn bread, baked in pones from one to two and three inches thick, make up the chief articles of food. Black coffee, black molasses and brown sugar are also used abundantly. Once in a great while, on Sundays, biscuits would be made, but they would always be made from the kind of flour called "shorts." As a rule, breakfast consisted of coffee, fried bacon, corn bread, and sometimes molasses—and one "helping" of each was all that was allowed. Peas, boiled with huge hunks of fat bacon, and a hoe-cake, as big as a man's hand, usually answered for dinner. Sometimes this dinner bill of fare gave place to bacon and greens (collard or turnip) and pot liquor. Tho we raised corn, potatoes and other vegetables, we never got a chance at such things unless we could steal them and cook them secretly. Supper consisted of coffee, fried bacon and molasses. But, altho the food was limited to certain things, I am sure we all got a plenty of the things allowed. As coarse as these things were, we kept, as a rule, fat and sleek and as strong as mules. And that, too, in spite of the fact that we had no special arrangements for taking regular baths, and no very great effort was made to keep us regularly in clean clothes. No tables were used or allowed. In summer we would sit down on the ground and eat our meals, and in winter we would sit around inside the filthy stockades. Each man was his own dish washer—that is to say, each man was responsible for the care of his pan and cup and spoons. My dishes got washed about once a week!

To-day, I am told, there are six or seven of these private camps in Georgia—that is to say, camps where most of the convicts are leased from the State of Georgia. But there are hundreds and hundreds of farms all over the State where negroes, and in some cases poor white folks, are held in bondage on the ground that they are working out debts, or where the contracts which they have made hold them in a kind of perpetual bondage, because, under those contracts, they may not quit one employer and hire out to another, except by and with the knowledge and consent of the former employer. One of the usual ways to secure laborers for a large peonage camp is for the proprietor to send out an agent to the little courts in the towns and villages, and where a man charged with some petty offense has no friends or money the agent will urge him to plead guilty, with the understanding that the agent will pay his fine, and in that way save him from the disgrace of being sent to jail or the chain-gang! For this high favor the man must sign beforehand a paper signifying his willingness to go to the farm and work out the amount of the fine imposed. When he reaches the farm he has to be fed and clothed, to be sure, and these things are charged up to his account. By the time he has worked out his first debt another is hanging over his head, and so on and so on, by a sort of endless chain, for an indefinite period, as in every case the indebtedness is arbitrarily arranged by the employer. In many cases it is very evident that the court officials are in collusion with the proprietors or agents, and that they divide the "graft" among themselves. As an example of this dickering among the whites, every year many convicts were brought to the Senator's camp from a certain county in South Georgia, 'way down in the turpentine district. The majority of these men were charged with adultery, which is an offense against the laws of the great and sovereign State of Georgia! Upon inquiry I learned that down in that county a number of negro lewd women were employed by certain white men to entice negro men into their houses; and then, on certain nights, at a given signal, when all was in readiness, raids would be made by the officers upon these houses, and the men would be arrested and charged with living in adultery. Nine out of ten of these men, so arrested and so charged, would find their way ultimately to some convict camp, and, as I said, many of them found their way every year to the Senator's camp while I was there. The low-down women were never punished in any way. On the contrary, I was told that they always seemed to stand in high favor with the sheriffs, constables and other officers. There can be no room to doubt that they

assisted very materially in furnishing laborers for the prison pens of Georgia, and the belief was general among the men that they were regularly paid for their work. I could tell more, but I've said enough to make anybody's heart sick. I am glad that the Federal authorities are taking a hand in breaking up this great and terrible iniquity. It is, I know, widespread throughout Georgia and many other Southern States. Since Judge Speer fired into the gang last November at Savannah, I notice that arrests have been made of seven men in three different sections of the State—all charged with holding men in peonage. Somewhere, somehow, a beginning of the end should be made.

But I didn't tell you how I got out. I didn't get out—they put me out. When I had served as a peon for nearly three years—and you remember that they claimed that I owed them only $165—when I had served for nearly three years, one of the bosses came to me and said that my time was up. He happened to be the one who was said to be living with my wife. He gave me a new suit of overalls, which cost about seventy-five cents, took me in a buggy and carried me across the Broad River into South Carolina, set me down and told me to "git." I didn't have a cent of money, and I wasn't feeling well, but somehow I managed to get a move on me. I begged my way to Columbia. In two or three days I ran across a man looking for laborers to carry to Birmingham, and I joined his gang. I have been here in the Birmingham district since they released me, and I reckon I'll die either in a coal mine or an iron furnace. It don't make much difference which. Either is better than a Georgia peon camp. And a Georgia peon camp is hell itself!

South Carolina.

A Home for Consumptives

BY N. O. NELSON

[Our readers will remember Mr. Nelson's inspiring article a few years ago, which described his successful experiments with co-operation in his factories near St. Louis and his share in building up the model village of Le Claire. The following article tells of his camp for consumptives in California, and the invitation at the end shows the type of rich man Mr. Nelson really is. We cannot forbear to quote the personal letter that accompanied the article: "I busy myself sixteen hours a day in setting up tents and cots and stoves, doing errands for the invalids, visiting and talking with them, a little labor on the land and the wood piles, ordering supplies, answering inquiries, my business and personal correspondence, and 'seeing to things.' To-day we have a stiff wind, which raises the dust. It is clean sand that hurts no one, and the discomfort of it soon wears off. Our pumping and irrigating go on day and night, about a million gallons in twenty-four hours. Last night up to 11.30 I took a hand in guiding the water in the way it should go. 'Twere well if men were as easy to guide. The gentlest touch of the shovel accelerates or diverts or stops the flow. We have a garden and cows and chickens, eight mules and a horse. In and about the camp proper we planted last spring pepper trees, umbrella trees, North Carolina poplars, almonds and apricots, and around the entire tract of 125 acres double rows of mulberry and eucalyptus. We now are about to set out 2,000 cottonwoods. In caring for the invalids that come and improving the camp and making a crop we are fairly busy and have something to do for all who are fit and willing."—Editor.]

I AM writing in shirt sleeves this 4th day of February, in front of my tent in the shade of a good old mesquite tree. The mountains in front, a few miles away, are as brown as the barefoot boy or the Philadelphia girl in August. To the west and the south, where the horizon is thirty to forty miles distant, a deep blue veils the high range and the noble San Jacinto, which towers over two miles heavenward, while I am sitting twenty feet below sea level. We are in no fear of being submerged. for the sand bank fifty miles wide and a hundred feet high that cuts us off from the Colorado River, and the Gulf of Califor-

nia is more secure than the dykes of Holland. In the desert valley and in the foothills are found abundant aquatic remains and marks, fresh from the ocean bed of not so very long ago, before the beach sands, blown by the steady sweep of the winds down the valley, built up a wall of sand that cut this 100-mile narrow bay off from the Gulf. A sandy valley, from three to ten miles wide, beginning at an elevation of 2,500 feet and running down to 265 feet below sea level, is totally void of streams or springs or rains or dews. Its flora is the sage brush, mesquite tree, greasewood and a few flowers; its fauna the coyote, rabbit and a large assortment of birds. Van Dyke has written a book about it, and Remington has painted its rich brown mountains.

It has long been known as peculiarly favorable for consumption and kindred diseases. The dryness, the warmth, the low altitude, all help. Open air treatment is now universally accepted as the best for tuberculosis. The days are all warm, there is no moisture, and thus tenting is practicable and agreeable. Camp life begets simplicity. Plain living makes high vitality. The low altitude and "heavy" air give larger oxygen supply for the limited amount of air that one or two half closed lungs can inhale. Open air, sunshine, plain, sound diet, will overcome the most prosperous colony of tuberculii. This is borne out by the fact that in these two winters, out of a total of about 50 consumptives, our camp has had but two funerals, one a suicide after four days' stay, and one death after a week's stay. Some have been ordered home from other places, have come here and are proceeding to get well.

I started this camp in December, 1902, to be a tent camp for invalids and the financially stranded. Of this class or classes California has its full native share and an enormous importation besides. There has been talk of a quarantine law against consumptives. A test suit has recently been brought to prohibit the boarding of such invalids on adjoining premises. Hotels and boarding houses refuse them, hospitals are hopelessly overcrowded, sanitariums are few and expensive, beyond the reach of the great majority. The climate of California on the seaward side of the mountains is rainy, foggy and chilly during all the winter months; it is not a better climate for diseases than that of the East or the Middle West. Patients come on the general reputation of sunshine, oranges and winter lilies; they find a cold reception; they have little means or none, they are outcasts. In many of the cities consumption makes up one fourth of the deaths. A more pathetic situation I have never known, not even in the city slums, or the hospitals or the battlefield.

A place to go to and be welcome, a place economical for those who have some means, and moderate outlay in keeping those who cannot pay, with all climatic conditions at their best, this seemed more needed in this delusive Southland than anywhere else, tho much needed everywhere.

Sanitariums crowd people together; they are jostled and depressed by the mass of invalids, they dwell on their ailments, they are much indoors. In camp they live apart by ones and twos—many of them have a well companion; they have something to do, they are in the sunshine and look out on the mountains and hear the birds all day, and sleep in the open tent, and some of them outside the tent. They have no worry about fading means; they see healthy people and active outdoor work about them. The well companions, men and women, can get regular work, and invalids can work if able. I bought 125 acres of land abutting on Indio Station, an important division point on the Southern Pacific, with railroad, hotel, shops and extensive yards, a village of about 50 houses and 300 people. This tract I have improved for beauty and use—with deep wells and pumping plant for irrigating and domestic water supply. Besides the camp proper I mean to have this land in high cultivation for invalids to enjoy and convalescents to work and live on temporarily or permanently. Desert land is exceedingly fertile when watered, and the crops are extra valuable for being early. Cantaloupes are a favorite crop, ripening early in June and yielding as high as $400 an acre. Alfalfa hay yields up to 15 tons a year in ten cuttings. The winters are delightful, the summers are hot. Invalids are benefited fully as much by the summer heat, tho the contrasts of

winter climatic conditions will always make it more favored as a winter resort.

The settlers of the valley are in large part those who came as a last resort to preserve life. Very few indeed have failed of complete recovery. A transient stay is useless; there should be a settled determination to remain until completely well, and perhaps for life.

Tenting is common in many parts of the arid and semi-arid West, but there are few places that combine complete dryness, high oxygen, economy and facilities. On the elastic terms of no charge to any one for camping ground and facilities, and low charge or no charge for tents and equipment, and in some cases board also, I am glad to receive all who apply.

IN THE DESERT, INDIO, CAL.

A Good Urban School Organization

BY CHARLES W. ELIOT, LL.D.

[The following article by the President of Harvard University was orfginally delivered as an address before the Public Education Association of Philadelphia last month. It has been revised by President Eliot for publication in THE INDEPENDENT.—EDITOR.]

THE subject assigned to me is the most important educational subject now under discussion before the American people; because the people are coming to live in cities, and the urban schools will henceforth educate a large proportion of American children. The problem is how to manage well the public schools of a great city. In what I have to say I shall confine myself to things which have actually been done in our country. I propose to report how a good urban school system might be planned, organized and carried on, because experience already shows what the elements of a good system are, and how they may be successfully combined and carried into practice. I propose to stick close to facts already established.

The fundamental question is the constitution of the School Board. How should a Board of Education be constituted? In general, the School Committee or Board of Education in American cities to-day is the outgrowth of conditions which existed when the cities were small towns. The small-town method, of course, fails to work well, as is perfectly natural.

Let us then start with the question, of how many persons should the Board of Education consist? In the first place, it should unquestionably be a small number. To my thinking, the perfect number is seven. Let me use an actual case in illustration, for I want to deal with facts—with things achieved. I have belonged for thirty-five years to the oldest educational board in this country, the prime governing board of Harvard University. It is called "The President and Fellows of Harvard College." It consists of seven men; and I believe I am justified in saying that its achievements commend it as a safe example to follow. It has had more than 250 years of successful experience, and the results of its labors are in plain sight. It is better to have an odd number of members; because, as a rule, the deciding number is larger by one when the number of members is odd. A satisfactory Board can undoubtedly be made up of seven, nine, or eleven men; because we already see good Boards organized with those numbers. Seven is ideal, because seven men can sit around a small table, and talk business in a conversational manner. They can talk together in a quick, simple, direct way, with absolutely no oratory, and no talking to the gallery or to reporters—just plain business talk, with specific proposals in view, and under the guidance of a chairman who knows the business and urges it on.

How should this small Board be selected? There may be cities in which

appointment would be safer than election, because the method of election has long been used with bad results; but I should say that, in general, slow replacement by election at large had proved to be the safest and most acceptable method. We have had various experiences on this subject in our country; but out of them all has emerged this best way—election at large, one member at a time or two at a time, and each member re-eligible once, but not more. If we imagine a Board of seven men, in a city where municipal elections take place every year, one member will be chosen every year, and each man will serve seven years, and be re-eligible for another term of seven years, making fourteen years of continuous service. Then should come a break in the member's service. The break is expedient, however much the city wishes to re-elect a man whose services have been very valuable. The majority of the members every year should be men of experience in the business of the Board; and that result will be secured by the long term of service. It may be desirable to re-elect a man for a third term; but there should be a break of at least one year before he is so re-elected.

What sort of men should be members of this Board? There should be no salary. The time and labor of the members are to be given freely to the children and the city. Clearly then only men of public spirit should be chosen. Public spirit is the very first qualification for membership in a Board of Education; and the next qualification is judgment, or good sense. How can this quality be secured? It can be secured by selecting only men who have been distinctly successful each in his own walk of life. Success in whatever honorable business a man has undertaken is evidence that there is good quality in the man. Next, he must have some appreciation of the importance of the office to which he has been elected, some conception of the magnitude of the task, and of the far-reaching effects of the service he can render. This ordinarily means—there will, of course, be exceptions—that he must have children or grandchildren of his own and a love for children, and that he must have some vision of the splendor of the work. That is the kind of man the School Board needs. His quality is obvious. What chance has a city of getting one or two such men a year by election at large? That will depend on the good sense and good feeling of the voters, and on the existence of some disinterested nominating body.

There is a possible alternate to the method of election at large—namely, appointment by the mayor or by the judges; but election at large is preferable to appointment, because the mayor would probably appoint political partisans, and the judges ought not to have such a function imposed on them. There is a School Board, organized on the principles I have described, which has been in successful operation for several years—the St. Louis Board of Education. It is larger than one would wish. It numbers twelve men, elected biennially, four at a time. I believe it to be the best Board of Education in the United States. It has demonstrated its high quality, and has worked well in practice. I therefore feel that the method of election at large in small groups has borne the test of experience.

The next question in regard to the urban school system is that of resources—how much money shall it have, and on what plan shall its money be raised? Next to the quality of the School Board that is the most important question of all. There is a best way—namely, to appropriate by law to the use of the Board a certain percentage of the city's total valuation for purposes of taxation. In some of our cities taxes are levied on real and personal property, in others only on real property; in either case, the legislature must fix the percentage. How adequate the results will be will of course depend on the discretion of the legislature. In the State of Missouri the legislature lately raised the amount of school money for St. Louis from four mills on each dollar of valuation to six mills at a single blow—that is, they added fifty per cent. to the income of the School Board of St. Louis by a single act. Now, that is a remarkable performance on the part of a State legislature, and an extraordinary proof of the confidence of the legislature in the efficiency and honesty of the Board. The act was passed be-

cause the Board had demonstrated its ability to use the additional funds judiciously. It had proved its worth. The School Board of St. Louis in the first year made use of only one of the two additional mills.

Now, what are the advantages of this method? The Board know that the valuation of the city increases from year to year, and that the annual increase can be predicted with a good deal of exactness. They can look ahead, and say, "Next year we shall have so much, the year after so much, and so on." They can predict their own resources. It is indispensable that the annual resources of the schools should grow with the growth of the city and of its valuation. When in one of our great cities sixty thousand children were unable to find room in the schools one September, except to attend partial sessions at abnormal hours, the Board could only say, "We did not know how much money would be at our disposal. We could make no plans in advance." In this respect St. Louis has given us an admirable example. Knowing the number of children they would have to accommodate in the schools, and knowing the districts which population was leaving and the districts which were filling up, they set about buying school house sites in the suburban parts of the city while land was cheap. They said, just as a private individual says, "There is a cheap bit of land fit for our uses. We will buy it now, because we know we shall need it later." They are always on the alert. This shifting of population is characteristic of American cities. They are all liable to lose population at the center, while suburban districts are becoming more thickly populated all the time; therefore, school sites should be bought outside of the city, directly in the path of the outflowing population, and should be bought before the price of land has risen. Centers of habitation change, but the schools do not move with them. Yet these phenomena can be predicted, and our School Boards should be able to act with this sort of foresight. If the School Board were not dependent on Councils, but had its own financial department and its own resources, it could anticipate its own needs. Whatever form of School Board be set up in an American city, it will not be able to do its work well unless it can predict its income. Knowing its income, a Board can say, "It costs so much to maintain the schools we have; next year there will be so many more children, and so much more money at our disposal. We can build two manual training high schools within two years, and three new grade schools a year in the suburbs." There will always be growing funds to meet growing needs.

The next question about a School Board is, what its functions or duties should be—what it should undertake to do. The ideal Board of seven men should, in the first place, decline all executive service. Nothing executive should be within their functions. It should be their work to determine the general policy of the school system. They should create and fill their own executive offices, direct expenditures, and settle questions that arise in the carrying out of their policy. I know by experience that these occupations would be quite enough for any Board of Education. They would take as much time and thought as an unpaid Board should be expected to give to the city. This limitation of function would be a new departure for most American cities. Most School Committees attempt to perform executive functions through sub-committees on high schools, books, supplies, teachers, janitors, and so forth. Thus, Boston has a School Committee of twenty-four members, which divides itself into numerous sub-committees, all of which attempt executive functions. This is the traditional method. Now, it is obvious that even a well-chosen, fortunately constituted School Committee will probably contain no experts on these difficult matters. Let us take the average sub-committee on books as an example. The sub-committee on books ought to know what books are used in the schools, what better books are needed and why, and what books are on the market. They ought to be able to understand the wishes and needs of the teachers in regard to the books they are forced to use. I should think a city unusually fortunate whose sub-committee on school books consisted of a banker's

clerk, a blacksmith, and a wholesale grocer, none of which estimable callings can be said to fit a man for the difficult function of selecting text books for schools. It would be as rational for a city to confide to such a committee the building of a bridge, or the laying out of a park, or the superintending of its hospital. In these days all executive work should be in the hands of experts. The man who ought to direct the purchasing of books for a city's schools is the man who comes in contact with teachers, school children, and school books every day of his life.

The first duty of the new School Board is to appoint its chief executive officers. How many should they be? St. Louis has shown the way. There should be four executive officers: first, a Superintendent of Instruction; secondly, a Superintendent of Buildings; next, a Superintendent of Supply; and, lastly, a Superintendent of Finance and Accounts. Each of these officers should report to the Board at frequent intervals, and should prepare an annual report of his work, to be printed and distributed to the public with the annual report of the Board itself. I need not say that every man should be an expert who understands thoroughly the particular business he is going to do. In regard to this organization St. Louis has shown the way. They have had several years' experience of this system, and its good results are conspicuously in evidence.

Let us first examine the functions of the Superintendent of Instruction. The organizing of the twelve grades of instruction is an exceedingly complex piece of business; it requires thousands of teachers, who should be selected, promoted, and dismissed by the Superintendent. Of course, the Superintendent should follow some public method of selection and promotion that can be clearly described and explained. He will naturally appoint examiners of new teachers, and inspectors of teachers at their work. Local means should be provided for training young teachers for service in the city's schools. There should also be a well-understood method of consulting principals about appointments and promotions; and there should be long probationary periods for young teachers. To maintain a large corps of teachers in alert and vigorous condition a system of retiring allowances is essential. The American pension system for soldiers and sailors has been so exaggerated and wasteful that many people distrust the pension method in civil employments; yet the value of the pension system has been demonstrated in city fire and police departments, in railroad systems, in the judiciary, and in the best universities of the country. A pension system not only promotes efficiency; it is more economical than the prevailing method of keeping disabled teachers in service at full pay.

The construction of programs of study for all grades of a school system is another function of the Superintendent of Instruction, a function which calls for a broad knowledge of the whole field, an intimate acquaintance with many details, and a rare mixture of ingenuity and good judgment. A good Superintendent will know how to secure the loyal co-operation of his teachers; for the best program may be defeated by indiscretion or bad faith in executing it. Finally, the Superintendent should be responsible for the tone or temper of the school discipline in all grades—for its gentleness, firmness, elasticity and steadiness. To find a man fitted by natural gifts and appropriate experience to discharge these functions will be the most difficult task of the Board.

The next executive officer should be a Superintendent of Buildings, new and old. This officer should give his whole time to the service of the Board, and should have been an engineer or architect by profession. Altho all the American cities and large towns have been building school houses with great activity during the past thirty years, the common stock of knowledge on the subject seems still to be small. There is much yet to be learned about fire-proof and slow-burning construction, and the best means of heating and ventilating a building divided into numerous rooms of moderate size. Large school houses are still built with halls and stairways which are far from fire proof; and gross overheating is very common. The officer who should have general direction of the repairs and improvements of

school houses and of the construction of new school houses would have his hands full. Great improvements have, of course, been made within fifty years. When I was a boy at a Boston public school ventilation was hardly thought of as a thing desirable for a school room; but to-day satisfactory apparatus for heating and ventilating a large building divided into small rooms can hardly be said to exist. I know that Harvard University has not solved the great problem of heating and ventilating. Urgent complaints have come to me this month from the professors who occupy two of our principal buildings; yet the University has spent within two years more than $50,000 on the heating and ventilating apparatus for those two buildings, a full third of this expenditure having been absolutely thrown away. I cite this experience to illustrate the fact that the Superintendent of Buildings of a large urban school system would have a very serious charge, requiring experience, habits of observation, and the disposition to attack vigorously new problems. A building contractor would not answer the purpose; neither would a man trained to any other business than engineering or architecture. This is emphatically the place for a broad-minded expert.

The Superintendent of Supplies would be the next executive head of a large department. For a well-conducted urban school system a great variety of supplies is now indispensable, such as books, writing books, drawing books, maps, models, prints, photographs, lanterns and lantern slides, and stationery of all sorts. If school gardens form a part of the city's equipment, a special sort of supplies will be needed for them. If manual training has been properly developed in all the schools, the peculiar apparatus needed for teaching that subject will be always in need of repair and replacement. If the city supports mechanic arts or trades high schools, the mechanical equipment of those schools will be exceptional, and difficult to maintain in full efficiency. If the school houses are used, as they should be, for evening schools, and as centers of social improvement and pleasure, these extensions of the school houses' serviceableness will demand considerable supplies of various sorts. There should be a lantern and a considerable collection of lantern slides in every school house, and in every school a teacher who is capable of using the lantern. The selection of the books to be used in a city's schools is in itself a very important and difficult function; for it is the custom to provide teachers and pupils with books in large number and variety, both for use in the school libraries and for the daily use of the pupils at school and at home.

The Superintendent of Supplies will need in all his work the direct advice of the teachers in the schools. Without such consultation it would be impossible for the most skillful man to do his work to the best advantage. This leads me to say that, in general, the teachers should be much more consulted by the executive officers of the school system than is now commonly the case. I know that my own functions as President of Harvard University could not be properly performed without constant consultation with the professors and other teachers, and frequent intercourse with the promising young men who year after year enter the University faculties. Every school principal ought to have a faculty of his own with which he statedly consults. In such a school faculty there would naturally be sub-divisions by departments of instruction. Thus, all the teachers of history would naturally associate themselves together in consultation over the needs of their department; and the opinion of each department about the books to be used and the supplies needed would deserve careful consideration.

The Superintendent of Supplies would have charge of the service of all the schools. He would be responsible for the purchase of fuel, and he should therefore control the engineers and janitors who spend the fuel. Here, again, he would need to keep in touch with the teachers; because their health and comfort depend very much on the intelligence and success with which the work of the engineers and janitors is done.

I have now spoken of three executive departments—instrutcion, buildings, and supplies. The subject of medical inspection of school children touches every

one of these departments. The bodily condition of the children affects deeply the discipline of the schools, the regularity of the children's attendance, and the rate of promotion; and these things belong to the department of the Superintendent of Instruction. A child may be pronounced stupid when he is really suffering from some chronic physical evil, which a competent school inspector could detect and possibly remedy. Thus, a child may have astigmatic eyes, and, in consequence, suffer greatly from headache, and be quite unable to keep up with his mates; or he may be suffering from adenoid growths in his throat or nose, which make him appear dull and inattentive, or actually make him deaf, and so apparently heedless. By thorough medical examination of each and every pupil, many children can be rescued from these sufferings and made capable of normal school activity. By frequent medical examination the children may be saved from preventable maladies, and from being unjustly blamed. Frequent inspection may also prevent the spread of infectious disorders. The health of the school children is all important to the success of the teachers' work, and is, therefore, emphatically the business of the Superintendent of Instruction.

The Superintendent of Buildings has also a strong interest in the health of the children. He is responsible for the air they breathe and for the temperature in which they work; and he can be greatly aided to do his own work well by medical inspectors, who report the temperature of the school rooms and the condition of the air therein. Again, the Superintendent of Supplies has a similar interest in the frequent medical inspection of the school houses. He, too, can get from the medical inspectors much important information about the results of his own work, and about the health precautions which should be taken in the interests of the children. Thus, the disinfecting of the books which are transmitted year by year from one set of children to another is a matter on which medical advice is valuable. Again, if meals are supplied in the school houses, medical opinion should be obtained as to the selection and quality of the provisions. Luncheon in schools has more importance, now that one long session, instead of two short sessions has been so generally adopted in the higher grades of the public school system. The care of the eyes of school children is a matter that should be much more insisted on than it is. If the eyes of a considerable portion of the school children suffer damage during their school life, the industries of the entire people will be inevitably impaired; for good eyesight is well nigh indispensable in the principal trades and occupations. Medical inspection throughout a city school system is therefore to be advocated on economical grounds, as well as for philanthropic considerations.

The fourth expert executive officer to be employed by the Board will be the Superintendent of Finance and Accounting. He would have charge of collecting all the receipts of the school system, and of paying the bills for all its expenditures. In some cities endowments have been provided for the benefit of the public schools, and the income of these invested funds makes part of the resources of the school system; but the great resource would be the taxes, determined by the laws under which the school system is carried on. To estimate, collect, and keep account of these resources would be part of the function of this fourth executive officer. He would also pass upon and pay all salaries, wages, building accounts, and bills for supplies. Every outgo for the schools would pass through his hands. It is obvious that a highly competent officer would be needed for these duties.

The terms of all four of these expert executive officers should be long. The American likes a long term, and his moral quality is favorably affected by long-continued service. The American community also pays more consideration to a long-term official than to one who has but a short tenure. Thus, in those States which elect their judges, it has been found expedient to elect for long terms; because the serviceableness of the judges was thereby greatly increased. Moreover, in the four offices which I have been describing, conscientious and able men would become more and more useful to the community as years went

on. They would gain both knowledge and influence by continued experience in their several offices. The first appointments to these offices might well be for a short term of years; but after satisfactory probation the tenure should be during adequate performance of duty.

I have now described the best organization of an urban school system for our country. The principles on which this organization is based are simple, and they rest on human nature itself. They seek to apply, for the benefit of schools, well-known mental and moral qualities of rational, conscientious men and women. The conditions for a favorable solution of the city school problem are by no means unattainable; indeed, they have actually been attained in good measure. Relatively to our hopes and our aspirations the public school system in the United States is a disappointment; but absolutely the public school systems of our great cities have done a great work, and by comparison with other branches of the public service are the most successful of our American institutions.

I have lately been making a limited inquiry into the success of the public schools compared with that of the endowed schools and the private schools, the investigation being entirely confined to results obtained in Harvard College. This is a limited field, but a representative one; for Harvard College is recruited annually from about two hundred schools and colleges scattered all over the land. About thirty per cent. of the young men who enter Harvard College year by year come from public schools. Now the public school boys, on the whole, pass better examinations at admission than the boys from the endowed and private schools. And how is it at graduation three or four years later? Do the public school boys hold their own in college down to the period of graduation? I find that at Harvard University the students who come from public schools graduate with somewhat higher standing than those who come from endowed and private schools. The honors are still with the public schools. I believe that similar results would be obtained from like inquiries at other American universities.

What we are aiming at, then, is the improvement of an invaluable public service. We are planning to make better the organization of the most serviceable of all American institutions.

CAMBRIDGE, MASS.

The Virginia Cardinal Bird

BY VIRGINIA CABELL GARDNER

THERE's never a bird in the wood
  But a sweet new warmth in the sun,
Oh! the feel of life is good,
  And the Winter is almost done.
Now, suddenly, clear and free
  And sweet, *so* sweet, are heard
From the top of the tulip tree
  The notes of the cardinal bird.
He is singing to call the Spring,
  As where is another can sing:
"Oh, hurry! come quick! quick! quick! quick!"

He has borne the Winter's weathers;
  He has given our hearts good cheer
With the flash of his crimson feathers,
  In the sad short days of the year.
Glowing against the snow,
  A flame in the cedar tree,
Hostage of Summer to show
  That she would return, was he.
Now Spring for her own bailiwick
  Comes claiming the land again,
"Oh, hurry! come quick! quick! quick! quick!"

OAK BRIDGE, NELSON, VIRGINIA.

While a Great City Burns

BY SAMUEL H. RANCK

Assistant Librarian of the Enoch Pratt Free Library

THE fire that destroyed the heart of the commercial and financial section of Baltimore on Sunday and Monday, February 7th and 8th, 1904, will be remembered as one of the great fires of the world. Altho discovered while people were assembling for worship, a few minutes before eleven o'clock on Sunday, it was not brought under control until late in the afternoon of the next day, after having extended in thirty hours a distance of nearly two miles, swept eighty city blocks, with an area of about one hundred and fifty acres, and destroyed some of the largest and handsomest buildings in the city.

It is not the purpose of this article to give a detailed account of the fire, but rather to note some of the things I saw on that eventful Sunday afternoon and night and Monday.

The first news I had of the fire was about two o'clock on Sunday afternoon, when the newsboys were calling out extras through the streets of the residence section about the "terrible big fire down town." I could see the great cloud of black smoke boiling up into the air, and, being one of the responsible officials of an institution with a building in that section of the city representing a value of over half a million dollars, I at once hastened down town along with crowds of others. The fire had then worked its way two blocks north from the starting point directly toward the building whose safety was of immediate concern to me, to within three blocks. Half a mile away I could see rows of blazing buildings with a great number of streams of water playing upon them. The fire line permitted one to approach within a block of them. The great shopping district of the city was just outside the fire line, and everywhere in that section there was the greatest confusion, wagons in the street, and merchants getting their goods out of the stores already filled with smoke, for the wind at that time was carrying sparks in great showers to the northeast, directly over the stores that were moving out. Four blocks northeast of where the fire was then raging the moving out process was continued, tho here it was office furniture, law books and restaurant fixtures that were being loaded on wagons of every sort and description—drays, delivery wagons, coupés, push-carts, etc. At three o'clock I saw guests moving out of the Carrollton Hotel, one block east of Charles Street. During all this time the streets for half a mile or more northeast of the fire were filled with smoke, falling ashes and burning embers, some of them the size of a man's fist; so that frequently umbrellas were raised as a protection from the fire that fell from the sky. Sometimes these umbrellas would go up with a blaze into smoke. I turned up my coat collar and fastened it tight around my neck to keep fire from going down my back. Men had their necks badly burned from sparks falling on their celluloid collars. Between three and four o'clock, six blocks from the main conflagration it was difficult to walk the streets to the northeast without stepping on red hot embers—blazing pieces of charcoal. Some of the sidewalks at that distance were then black with the pieces of burned wood that had cooled. During all this time three of the newspapers were selling extras on the street (with illustrations of the fire), which were eagerly bought at advanced prices, and at the offices of some of them there were immense crowds watching the bulletins telling of the progress of the conflagration and the efforts being made to check it.

The expression on the faces of the crowd in the afternoon was chiefly that of intense interest, sometimes jovial; late at night the prevailing expression was that of awe, and on Monday, agony, added to haggardness from loss of sleep. During Sunday afternoon one might occasionally hear a flippant remark, along with remarks about Pompeii and Nero

at Rome. Had any one perpetrated anything in the nature of flippancy at night some one in the crowd would surely have called him down, as I heard one person called down for saying that a certain blazing building was a beautiful sight. All idea of beauty in a fire had then passed away. It was the demon, the fiend, that the people saw.

The two main streets of Baltimore are Charles and Baltimore. Charles Street extends north and south and divides the streets of the city east and west. Baltimore Street extends east and west and divides the streets north and south. The fire began in a six-story wholesale dry goods house one block south of Baltimore Street and two blocks west of Charles Street. It was followed almost immediately by a series of explosions that shook the city and that set a half a dozen other buildings ablaze. The strong wind from the southwest soon carried it north of Baltimore Street, and the fight all of Sunday afternoon was to keep the blaze west of Charles Street. Had this been accomplished the burned area would have been at the most eight blocks, instead of eighty.

Between half-past five and half-past six I walked around the whole of the burning area. The firemen had then been fighting for seven hours and showed evidences of exhaustion, tho they were working bravely against fearful odds. I noticed several engines on the south side that were not working, but whether from lack of water I do not know. The fact that they were not working gave rise to the rumor that there was an insufficient supply of water. To me it seemed at the time that the men were working without leadership and that they felt that they were fighting a losing battle. They were simply hanging on. The electric lights were still burning, tho here and there were sputterings of blue flame from crossed wires. The crowd seemed more afraid of wires overhead and in the street than of falling walls, falling glass or falling fire. Buildings were then being blown up by dynamite, and after every terrific explosion of this sort there was a great rattling of broken glass, even a block or two away. Sooner or later sparks would enter some building ahead not yet on fire through the panes broken by dynamite, and then another building ahead of the main conflagration would start a new one. In one instance I noticed these flames would be put out by some one inside of the building, only to be lighted again by other sparks entering the same way.

The roar of the flames, of the wagons on the streets carrying away merchandise, the gale swaying the network of overhead wires, the explosion of dynamite wrecking buildings or the explosion of oils or liquors stored in warehouses, together with the shrieks of whistles on fire engines, the shouts of drivers and newsboys, and the red-white glare that lit up thousands of awe-struck faces and made high buildings in the distance, masts and steamboats in the harbor and the tall white shaft of the Washington monument take on the appearance of new bronze statues bathed in sunlight—it would require a Dante to give an adequate idea of this, the situation after nightfall. Strong men became sick and weak. They went to pieces. They could not stand by helpless and look on. A few books and papers hastily tied together and held in their arms represented whatever was left of this world's goods and the work of years, and with these tightly grasped they sorrowfully turned homeward to tell wife and family that they were ruined, ruined. Women, too, were there—women in silk dresses, helping to remove goods and save things from the impending destruction; and women seeking husbands or sons in the crowd, asking friends if they had seen them, were they yet alive; for the men had come down to save things from office or store. These women could not endure the agony, the suspense of waiting at home alone.

Between nine and ten o'clock the fire was a block east of Charles Street. The wind was blowing from the west, carrying the advance of the fire directly down Baltimore Street. The rain of fire to the east was more terrible than ever, and yet, rushing toward it, the wind on the street—the back draft—was blowing hats off and carrying them to the flames, directly contrary to the way the sparks were flying above. For a long time I stood on Light Street, two blocks south of Baltimore Street, watching the fire where these

streets intersect. The crowd said little, except an occasional remark that it was awful, but gazed intently. The heat could be felt in the face, tho no sparks were blowing that way at the time. Two clothing houses, a bank, a drug store, a large hotel, the historic Carrollton, the site of a hotel frequented by George Washington in his journeys to the north from Mt. Vernon and back—and a sporting goods place took fire one after the other and burned without the slightest regard to the efforts of the firemen. At times the whole width of the street was one quivering mass of flame. No man could live near it, and, as for the water thrown by a fire engine or two, one might as well have tried spitting at those buildings to extinguish the flames. It would have been as effective. The explosion of cartridges and powder in the sporting goods store kept up a rattling sound like musketry in battle, and this, with the dynamiting of buildings that made the ground tremble under your feet a moment or two before you heard the roar of the explosion and the fall of the walls, reminded me more and more, the longer I watched the burning of Baltimore, of the descriptions of the burning of Moscow in 1812. While watching the Carrollton and the other buildings burn the flames from the block southwest of it were shooting up over the line of the high buildings to the left of where I stood. I then walked three blocks east of where the flames were rising to my left, to South Street—the Wall Street of Baltimore—and discovered that buildings—banks and insurance buildings—were already aflame at the cornice line, while firemen were trying to get a stream of water to that high point. A little before eleven o'clock I was on Baltimore Street, four blocks east of Charles and nearly three blocks east of the advance line of the main conflagration, and then I saw still further east, one block, two blocks, other buildings afire, with small blazes at the roof line. Walking around to the post office I proposed to get the mail in the box belonging to my institution, but none was there, even tho I had seen a large lot when I had taken my personal letters out earlier in the evening. The next morning it was all back again, tied in a bundle. It had been removed by the post office authorities for fear that the post office might be destroyed. By this time the militia was on the scene and was aiding the police in guarding the fire lines. I saw, however, no disorder whatever on Sunday.

Near the post office are some of the highest and finest buildings of the city. The block west of it is occupied by the splendid new court house and on the east front of the court house were lines of police patrol wagons, but whether they were taking things out or moving them into the building I could not tell. The block east of the post office block is occupied by the city hall. None of these three buildings were destroyed, tho they were directly in the path of the fire. The court house suffered most, for the surface of some of its marble walls and the cornices were turned into lime by the heat from blazing buildings across the street. Lexington Street, two blocks north of Baltimore Street and the northern boundary of these three public buildings, is the northern limit of the devastated district.

Facing the court house on the south and one block east of Charles Street is the Calvert Building, a steel-frame twelve-story office building of modern "fireproof" construction. The heat and flames from the burning buildings to the west beat against this building in vain for some time, and it was hoped that it would not fall a prey to the flames. Finally, from a window in the ninth floor a tongue of blue flame flashed for a moment only, then another blue flash, another and another—like a snake that darts its tongue in and out when excited—and then a steady blaze of red fire out of the window. In half a minute another window was broken and ablaze, and in less time than it takes to write it all the windows on that floor on the west side were flaming torches. It happens that I was familiar with the corner office on the ninth floor from which the flames first burst forth in that building. It was the private office of a lawyer and contained comparatively little furniture. His law library was in an adjoining room and the flames shot from the windows of the library in considerably greater volume. The floor, the furniture and the books were all there was to burn, and yet the flames that shot out the windows

were many feet in length. The intensity of the heat consumed them in a few minutes.

The highest office building in the city is the Continental Trust, on the corner of Baltimore and Calvert streets, two blocks east of Charles. It is the same type of construction as the Calvert Building, but it is sixteen stories high. In this building the flames started on the fourteenth story and in the same way—a tongue of blue flame darting several times from a window frame and then a steady blaze from one window after the other, and from one floor after the other, this building, like so many others I saw, literally burning down rather than up. And so the wreck and ruin was carried from building to building and block to block, all through the night—a night when few people in the city tried to sleep and most of those who tried could not. In a few hours more the flames were as far east as the Maryland Institute, one of the historic buildings of Baltimore, where candidates had been nominated for the Presidency, and to Jones's Falls, a small stream that flows through the city and for the most part is an open sewer. The Falls is eight blocks east of Charles and ten east of where the fire started. If the fire should pass beyond the Falls it would get into one of the residence sections of the city, where the people were already moving their household effects out, paying for a single load, it is said, as much as $25. In the afternoon four and six dollars a load was the price you paid to have the things hauled from your office to a place of safety, sometimes your home, sometimes a warehouse, tho it happened in more than one instance that the " place of safety " and the goods stored therein were burned up later in the night. Even in the residence sections all through the night the rattle of wagons hauling things from the path of the fire never ceased.

During the night the temperature fell very rapidly. On Sunday afternoon and night I was comfortable without an overcoat. On Monday morning you needed your overcoat badly and then you shivered if you stood in the face of the stiff northwest wind. The shifting of the wind from the west to the northwest saved the northeastern and eastern residence sections of the city. It blew the fire toward the harbor, and further it could not go. But it was a desperate fight for the firemen to keep the flames from gaining a foothold east of the Falls. Near the harbor both sides of the Falls were lined with lumber yards and mills for the manufacture of things made of wood. There is a bridge at every street, and here the firemen fought the flames west of the Falls, protecting the property east of the Falls, while in one instance the bridge was burning under them. In the neighborhood of President Street Station toward noon one could not see the sun for the smoke, and at times you could not see the firemen, who were two blocks nearer the burning lumber than the fire line. At the fire line one's eyes burned from the smoke and fine ashes got into them. Many a fireman's eyes were nearly ruined from the smoke and the heat. It was painful even to see the eyes of those exhausted men, swollen, red, blistered and blinded.

The crowd on Monday morning was quite different from what it had been at night. Many men had taken to drink, both to keep warm and to drown the misery of their misfortune. Many drunken men were on the streets. In the crowd, too, around President Street Station flasks were plentiful, tho the authorities had the saloons closed by that time. These flasks were passed to the hungry and half frozen militia men on guard, and a few of them showed the effects of liquor. I saw one of the soldier boys—a mere boy he was—drink the greater part of a pint bottle of whisky without once stopping to take breath. The militia were, however, very efficient in keeping the crowd back of the fire line —sometimes an imaginary one and sometimes a light rope or a wire stretched from lamp post to lamp post.

The excitement, the suspense, the agony and the despair that were to be seen on the streets on Monday while the fire was still beyond control could only have been equaled once before in the city's history—when the men marched down to North Point in 1814, after the bombardment of Fort McHenry, to give battle to a victorious British army fresh from the burning of Washington. Seven of the eight daily newspapers had been burned out during the night. " Extras " of the remaining one were eagerly

bought at five cents or ten cents a copy. The early extras on Sunday afternoon could be bought for two cents. Regularly these papers sell for one cent. Papers from Washington, Philadelphia and New York were all eagerly bought at two and three times the regular prices. Of the papers that were burned out the *Sun* had copies of Monday's paper (an abbreviated edition containing little else than fire news) on sale in the residence part of the city before eight o'clock—printed in Washington, altho their building did not take fire until midnight.

Before midnight on Sunday the fire had not been able to get south of Lombard Street, two blocks south of Charles. The shifting of the wind carried it south to the water front and to hosts of warehouses that seemed perfectly safe earlier in the evening. Early on Monday morning it swept the great power plant of the city street railway system, and then transportation by car lines was at a standstill throughout the whole city. During the night the central offices of both the telegraph companies were destroyed and also the principal exchange of the leading telephone company. One realized then as never before what these things mean in the life of a modern city.

The heat of such a large fire can hardly be imagined. I have already referred to the marble of walls burned to lime from burning buildings more than sixty feet away. Letters in boxes on the street were burned, tho wooden telegraph poles are still standing, when they were protected from the direct path of the flames. The danger to high buildings in such a conflagration is very great, as is shown by the fact that several low buildings entirely surrounded by burned ones were little injured. The danger from high buildings is also very much greater. The sparks from them are carried much higher and farther, higher both because they are higher when they start and because of the additional draft. The burning of the lumber yards threw comparatively few sparks for these two reasons—near to the ground and no extra draft, and, moreover, the sparks they did throw were small and soon burned out.

While the material effect of such a fire is interesting to cities, to insurance men and to architects and builders everywhere, the psychological effect on the people looking at it and on those trying to combat it or to rescue it from their property is no less interesting, even tho it is of less permanent importance.

BALTIMORE, MD.

Mark Hanna's First Campaign

BY SAMANTHA WHIPPLE SHOUP

[The following article is one that was published in THE INDEPENDENT seven years ago. We reprint it, as it shows a very typical side of Mr. Hanna's nature. Next week we expect to print an article on Mr. Hanna, with special reference to his capital and labor views, from Ralph M. Easley, who founded the National Civic Federation, of which he is now secretary.—EDITOR.]

THERE are teachers and teachers, or, rather, there are teachers and drill masters. Under the drill master, plodding mediocrity, with a good verbal memory, wins all the honors; originality of thought is an offense; independence of character and force of personality, an insult, and genius itself a thing to be regarded with suspicion.

In the Prospect Street School in Cleveland, in 1851, there was a principal of the pronounced drill master type. "Mind what I have to say and learn it as the book gives it," was his ultimatum—his ideal of the proper method to train character and mind.

But one day there came into the Prospect Street School a very young man, "lithe and tall and slender," black-haired and gray-eyed, with a face at once strong and sympathetic. This was Emerson E. White, since one of the most famous teachers of the country, but then at the outset of his career. The Prospect Street School was to be divided, and Mr. White was to take charge of the new school on

Clinton Street as soon as its building should be finished.

Mr. X. courteously invited Mr. White to take charge of the class then in recitation—a class in the ever-memorable Colburn's "Mental Arithmetic."

"The pupils have their numbers; read a problem and call on some number for the solution," he said.

Mr. White took the book, read out a problem, and called on No. 8 to solve it.

"Oh," said Mr. X., in disgust, "don't call on *her; she* never can do anything."

Mr. White glanced along the line, and at once identified No. 8—the sensitive, shrinking face dropping in an agony of shame and misery. He grasped the situation at once. "I will read it again," he said, gently, "so that you may be sure you understand it." He read it, slowly and clearly, then walked down the line of pupils and stood by No. 8, so that he was between her and Mr. X., the sight of whom, he perceived, filled her with confusion and terror.

"Now you can do it," he said, reassuringly; and to her own delighted astonishment little No. 8, who had never had the courage to speak an audible word to Mr. X., spoke up distinctly and went through the solution without a hitch.

"The child came home from school that day perfectly transfigured," said her mother. "I could not believe my eyes when I looked at her."

Presently the Clinton Street building was finished, and Mr. White came into the Prospect Street School, and read out the names of the pupils who, by the division of the district, were assigned to him. Happy No. 8 was among them, and several other girls who have since become distinguished women, while the boys included Marcus Hanna, also Sylvester Everett, Albert Tuttle, two distinguished citizens of Cleveland, and, in the lower class, John D. Rockefeller and A. L. Bartholomew, of Iowa.

One would suppose even a drill master might have discerned some signs of ability in that collection of young people; but Mr. X., perhaps vexed at their evident pleasure, made the ungracious remark, as he surveyed the line of pupils:

"I don't begrudge you the lot; there isn't a scholar among them."

To the utter amazement and the consternation of the school, timid, silent No. 8 turned in a blaze of indignation and cried:

"How dare you say such a thing? We will be twenty per cent. ahead of your school in two years! Mark it!" and walked out of the door.

The gauntlet had been fairly thrown at Mr. X.'s feet, and the Clinton Street School were determined to make good the challenge or perish in the attempt. Perhaps they would have succeeded in any case; but, considering the material of which most boys and girls are made, it is very doubtful whether their indignation would have held them to the mark for two years of strenuous work if the born leader and organizer had not been on the spot.

Marcus Hanna did not content himself with learning his own lessons. It was no individual triumph but a class victory that was needed, and that could only be won by concerted effort. For six months, by his arrangement and under his leadership, the class met out of school hours to drill each other in their lessons and strengthen the defenses. Emerson White did all that any teacher could to help and direct, but it was Marcus Hanna that kept the class all at work. There was a prize for drawing. Marcus agreed with a certain number of the class to go out early in the morning and sketch from nature. As surely as morning came there was Marcus under their several successive windows, throwing pebbles at the panes to awaken them. In short, he organized victory in 1853 as he organized it on a larger field in 1896. No. 8's "Mark it!" was caught up as a sort of class word, and it was partly owing to the frequency and emphasis of Marcus's use of the phrase that his own name was shortened to the abbreviated form it has ever since retained.

The class won, of course. They beat the old school by the stipulated per cent., and Mark Hanna himself took the prize for map drawing.

As for little flaxen-haired John D. Rockefeller, in the lower class, his lessons were no trouble; he could learn them in ten minutes, and had abundant leisure and superabundant energy and enterprise to devise mischief. Emerson White frequently requested his kind assistance to

put work on the blackboard, and so forth; but all the resources of pedagogical ingenuity were taxed in vain to find enough extra work to keep John D. Rockefeller out of mischief. In this dilemma Mr. White said confidentially to some of the girls: "We must all do our best to find things to keep John busy. Now when I send him to help one of you girls with your work, you must always need help." Thereafter, when other employment failed, John Rockefeller was usefully occupied in helping some of the girls to solve their problems or draw their maps—to the great advantage of the peace and prosperity of the school. Now, Emerson White, after a long and honored life, thirty years Superintendent of the Cincinnati schools, organizer and President of the National Educational Association, etc., etc., is spending his declining years in a beautiful home in Columbus, O., the gift of John D. Rockefeller, in grateful recognition of the teacher who knew how to manage a mischievous boy.

[Mr. White died in 1902.—EDITOR.]

DUBUQUE, IA.

Socialism or the Catholic Church—The Impending Conflict

BY EMILE VANDERVELDE

[Our readers will remember an article by Emile Vandervelde, entitled "Socialism in Europe," which we published last summer. Professor Vandervelde is universally recognized as one of the most scholarly and brilliant of the Socialist leaders of Europe. He is the leader of the Belgium labor movement and is a member of the Belgian Chamber of Deputies. He has written any number of pamphlets and articles for periodicals and at least one book, "Collectivism; or, Industrial Evolution," a translation of which has had considerable sale in this country.—EDITOR.]

IN the United States, where religion is a private matter, an affair of conscience, where no religious sect dominates, or pretends to dominate, others, it must be difficult indeed to realize the bitterness of the contest that rages in most of the countries of Western Europe between the Roman Catholic Church and its opponents. It is not alone in France that this contest grows in intensity.

During the last few years throughout Western Europe there has been a marked reaction toward clericalism. The Catholics have organized themselves into powerful and well-disciplined parties. The covert authority of the convents, which had been abolished by the Revolution, has been developed under new forms, and religious associations have attained a greater control over education, while the political influence of the Church since the beginning of the pontificate of Leo XIII has made itself felt on all sides.

In our little Belgium the Conservative party, made up in large part of the supporters of the Church, has been a power for the last nineteen years. In the Netherlands the majority in the States-General (the two legislative houses) belong to a truly extraordinary coalition of Catholics and Protestants—of disciples of Loyola and of Calvin. In Germany the Center (the Catholic section of the Reichstag), tho it declines in influence among the working class, appears more and more the hub of the Government majority. Protestant Conservatives pay their court to it, while the Lutheran Emperor betakes himself to Rome to bow before the Pope. In England, where frequent conversions to Catholicism are loudly advertised, and where the Established Church reveals a growing disposition to imitate the Roman Church, Mr. Balfour's Ministry grants equal appropriations to all the religious sects in the Education bill and makes important concessions to Rome in order to conciliate the Irish Catholics.

In short, in all the countries of Western Europe, in Germanic or Anglo-

Saxon as well as in the Latin countries, clericalism gains, or at least seems to gain, ground. When in the minority its opposition becomes more aggressive; when in the majority, or holding the balance of power, its domination waxes heavier.

But, by a natural reaction, anti-clericalism, which had been relegated to the background on account of the pressure of socio-industrial issues, has again appeared and is spreading in every direction. In France, in Italy, and even in Catholic Spain, the old cry of "*A bas la calotte*" resounds on all sides. The veterans of former battles return to the ranks. The youth are divided again into Catholics and anti-Catholics.

But it would be an illusion to believe that nothing is changed, and that the reviving struggle between the clericals and the anti-clericals has the same meaning as had that of the epoch of Pius IX and his syllabus. First of all, it is clear that since the rise of Socialism the efforts of the Catholic Church are not directed against the same enemies as of old. From having defended the nobles and the kings of *l'Ancien Régime* against the liberal, republican, revolutionary middle class, it turns to-day to defend the middle class, which has become conservative and even reactionary, against the assaults of the Socialist proletariat.

Fifty years ago Catholics denounced Liberalism as "a pest and a frenzy." To-day clericals chant the "Marseillaise," since it has become, through the strange vicissitudes of things, the national hymn. Clericalism calls itself liberal when, as in France, it is in the minority. It disdains, or at most, uses the Liberals when, as in Belgium and Holland, it is in the majority. But always and everywhere it attacks Socialism, and by cunningly encouraging the fears which Socialism inspires in the classes who have property to lose, it succeeds in holding its old positions and even advancing to further ones.

It would be a great mistake—and far-seeing Catholics have no illusions on this subject—to suppose that the present revival of clericalism means an awakening of religious faith, even among Catholics. Doubtless a certain number of persons of conservative religious instincts, fearing the logical consequences of rationalism, return to the Church, and by interpreting symbolically the old articles of faith construct a new creed which contents them. But these are only superficial drifts; they are but eddies of the great tide that bears the people of Europe in a diametrically opposite direction.

One of the heads of the Belgian Catholic party, M. Woeste, acknowledged this in an article published some time ago. "The Roman Church in Europe may gain voters," he says, "but it continues to lose souls." Even in Belgium, where the Church reigns through intermediaries; where the Government, in its complete subservience, chooses magistrates and functionaries, imposes religious teaching in the schools and grants appropriations as authority and wealth command, there is no doubt that the masses reveal a growing disaffection to the ecclesiastical power.

It is an indubitable fact that, notwithstanding appearances to the contrary, Europe is now decatholicizing herself. One might even go further with safety and say that she is dechristianizing herself. Slowly but surely, with the irresistible movement of a geological subsidence, faith is waning among the industrial workers and even among the peasants. One can safely assert that about twenty years ago nearly every one held to some religious creed. Freethinkers were few and to be found only in the middle class. Societies for promoting secular marriages and burials existed only in the larger cities. To-day we see them spreading and multiplying throughout the industrial centers and wherever mining and manufacturing are carried on. In Belgium, in France, in Germany, the workmen who follow no particular creed number hundreds of thousands—yes, millions—and as their hopes of a heavenly kingdom dissolve other hopes assert themselves with a growing intensity. Wherever free thought penetrates Socialism enters also. We know, it is true, many workmen who become Socialists without relinquishing, or without totally abandoning, their religious convictions; but, aside from "yellows" and "blacklegs," acting solely from mercenary motives, we neither know nor can conceive of any freethinking workman who is not at the same time a Socialist.

What wonder, then, that this conserva-

tive middle class, instinctively antagonistic to Socialism, should become more and more antagonistic to free thought! Just as the coming of spring in the mountains dissolves the glaciers and sends down floods of icy water which cool the atmosphere of the low lands, so under the sunshine of free thought the breaking up of the religious creeds of the proletariat chills the rationalistic tendencies of the middle class. Frightened by the socio-industrial consequences of free thought, an increasing section of the rich class leans toward the Church, and especially toward the Catholic Church, which is regarded by all as the strongest bulwark of the capitalists' interest. The terror of revolutionary ideas drives this section to at least the pretense of believing; and sometimes, thanks to the efforts of the Jesuits, it succeeds in inculcating belief in its children.

It is thus that the apparent clerical reaction is explained. Far from its corresponding to a general awakening of religious faith, it is in fact a corollary of the decline of faith among the masses. But it is nevertheless true that the alliance of priest and capitalist, the coalition of spiritual and temporal power, against Socialism and free thought, furnishes the conservative and reactionary parties with formidable means of action and constitutes the most redoubtable threat against the immediate future of European civilization Progressists have not only clericalism to fight, but also, under different forms and labels, militarism, protectionist imperialism, and in most countries a marked tendency on the part of the sovereigns to enlarge their personal power to the detriment of the sovereignty of the people.

What else than proletarian power can we oppose to this reactionary power? Can we depend on the middle class as a class, or on Liberalism as a party? Facts answer. In Belgium, in Holland, in Germany, the Liberals are terribly weakened; the fear of Socialism demoralizes them. It is only too often that the reactionary majority in the elections is due to their votes. In England the division and melting away of the Liberal opposition made possible the South African war, and render possible, if not probable, the success of Mr. Chamberlain's fiscal plans.

Justice forbids us, however, to reproach English Liberalism as a body with the reactionary complaisance of the right wing. In France, too, there is a distinction to be made. The Republican middle class and the radical democracy do not hesitate to accept the help of the Social Democracy in the fight against the Catholic Church by enrolling Millerand in the Ministry and electing Jaurés Vice-President of the Chamber of Deputies.

But we must not lose sight of the fact that France is, above all, a country of *bourgeoisie* and small land-holders. The industrial centers are far apart, except in the territory bordering on the Belgian and German frontiers. The organization of the working class is therefore comparatively weak. Socialism itself is often, in France, but the idealistic expression of an advanced radicalism. It thus seems natural enough that the middle class parties should not show it, but should be anti-clerical rather than anti-Socialistic. But let industry develop on a large scale, let the antagonism of the classes accentuate itself, let the French proletariat strengthen and extend its organization, and we shall see in France, as in the rest of Western Europe, the middle class facing about and asking pardon of the Church for the ills it has suffered through her.

Thus it is, in the old world, that two gigantic coalitions are formed by the elimination of intermediaries: the Black International and the Red International. On the one hand are all those who hold that authority should descend from above and who find in the Catholic Church the most perfect expression of their ideal, the most inflexible guardian of their class privileges; on the other hand are those who insist that authority shall come from the people, and who, by the logic of circumstances, can found their hopes on nothing but Social Democracy.

Between these two extremes Protestantism hesitates and Liberalism shifts from place to place. One may see clearly the truth of the prediction that was made about fifty years ago by the Catholic writer, Donoso Cortès:

"The Liberal school honors equally darkness and light. It has undertaken—extravagant and impossible undertaking—to govern without the people and without God. Its days are numbered. One sees already on the two op-

posite points of the horizon, the rising sun that proclaims God and the ominous cloud that announces the mad rage of the people. In the terrible day of battle, when the whole arena shall be filled with the Catholic and Socialist phalanxes, no one will know where to find the forces of Liberalism."

One may welcome or deplore the fact of this coming concentration of forces about the Catholic Church on the one side, the Social Democracy on the other. But none can deny that this concentration is inevitable, and that the future struggles will have to be fought out between these two armies. To those, therefore, who are interested in the social movement of Europe, we say: Observe, above all else, if you wish to consider only the essential factors, the political activities of the Roman Catholic Church and those of International Socialism.

BRUSSELS, BELGIUM.

The Prospects of English Poetry

BY GEORGE SAINTSBURY

PROFESSOR OF RHETORIC AND ENGLISH LITERATURE IN EDINBURGH UNIVERSITY

THERE is no intention, on the part of the writer of these few words on a great subject, of saying pretty things to some living English poets and things the reverse of pretty to others; but only one of pointing to a curious phenomenon, or absence of a phenomenon. That all our poets of considerable excellence who were born before the middle of the nineteenth century have passed away, Mr. Swinburne, Mr. Bridges and one or two more excepted, has nothing very remarkable about it. The race of poets is not less like "the race of leaves" than other divisions of humanity are. And I do not propose at the present moment to discuss or to allot the particular *plus* or *minus* quantity of excellence which ought to be allowed to the various writers of English verse who have been born later. The point of the present discourse is that, with the exception of Mr. Kipling, who is a sort of "species by himself," no one of these later singers, excellent, not so excellent, or not excellent at all, has launched a distinctly *new* poetical bark on the waters of English poetry. Some of them have, as the old naval phrase went, "razeed" old ships more or less successfully; most have put together rafts out of the old planks which serve the purpose *tant bien que mal.* But for the last three decades a very careful and affectionate reader of poetry can remember nothing in the very least resembling that distinct novelty in individuals or groups which was shown multifariously by the great English poets between 1798 and 1820; doubly and with striking difference by Tennyson and Browning ten years later; distinctly by the Preraphaelites twenty or thirty years later still. We have apparently returned, whether the results be better or worse, to something like the eighteenth century habit of echoing great masters of the nearer past, if not even to that earlier one recommended boldly by Vida and other critics of the neo-classic school—the process of tesselating reminiscences and even actual phrases from masters farther off as well as nearer home.

When I read most poetry of the day I constantly think of that nearly best of Dickens's incidental stories which tells how the inhabitant of a London Inn of Chancery furnished his rooms with furniture which he had borrowed (to use the language of the polite), and how one night a mysterious stranger appeared, and, without any preliminary expostulation or accusation, went around in a ghostly manner, laying a hand on each piece and murmuring, "Mine!" Only in this case the scene would be even more terrific, because not one but dozens and scores of honored specters would troop through our poets' mansions, uttering the blood-curdling formula.

How Milton would lay *main basse* on

the ejaculatory proper names at the beginning of this bard's sonnets! How Wordsworth and Arnold might find their fingers jostling (in which case I am rather sorry for Mr. Arnold) on so-and-so's statuesque or plasteresque constructions and phraseology! What furniture vans of "ekoskevephorous" dimensions (I have not invented this appalling word, as some Londoners will know) would Tennyson require to carry off his tuns of word and phrase and verse!

Rossetti and Mr. Swinburne (the last luckily in the flesh) would find themselves creditors to hardly less extent; and, without going over the whole range of foreign literature, one may just observe that Heine would discover a very large amount of his property in the abode of the Briton, whom he loved not, and that Baudelaire would find that the international exchange had already rather more than settled any account he might have with De Quincey and Poe. Of the condition of our poetic chambers after the process of redistribution had been accomplished, one would rather not speak. "The Muse," it is to be feared, would once more "find Scroggin" in too many cases with very little more than the traditional "rug" to cover him, and almost without the traditional truckle-bed to support his frame.

I trust it may be unnecessary for me to insist that I am not in the least raising the wretched old cry of plagiarism against our younger and middle-aged verse writers. Practically speaking, plagiarism is a crime which cannot be committed; for, if the plagiarizer produces any good effect, "he who takes it makes it" and it becomes his own; while if he does not, the thing dies and disappears—it is not the original thing stolen at all. Moreover, if it could be committed, it would be a necessity that it should be done purposely, consciously and with intention. I do not think that in these proper senses it is any commoner in these days than it has been in all days. The *publica materics* is still *privati juris* on the proper terms, as it always has been. A thousand great poets of the future, if the future is fortunate enough to possess so many, will be as well entitled as great poets in the past, from Dante to Tennyson have been, to put in their own way one great saying[1] uttered on the threshold of the Dark Ages by Boethius as others from Villon to Coleridge and from Coleridge to our Preraphaelites have been to put another[2]. If this were all that had to be said against the poetry of the present generation (taking that word in its usual sense of the last thirty years), it would be nothing and less than nothing. The range of material grows greater—and happily greater—for each such generation, and its indebtedness of a certain kind is therefore apparently larger. But its *credit*—the credit of each—is never exhausted; it cannot outrun the constable if it only observes the really good old rule, the exquisitely simple, tho, it must be confessed, not easy plan of making what you take your own.

The point to which I am drawing attention—not, by the way of fault finding, which would be indeed ridiculous, but as to a piece of natural history—is that one looks in vain in our younger poets for any sign of one of the great changes which certainly do come over poetry at longer intervals, or even of the small ones which come over it at shorter. Take, for instance, such a vigorous and in his way most individual writer as the late Mr. Henley. I knew Mr. Henley for some five and twenty years, and, tho we did not agree upon all points, I have never hesitated to recognize in him that spark of genius which is so rare in most generations, which is never so common in any. I think, moreover, that he showed that genius better in verse than in prose—that he was much better as poet than as critic. Nor do I find any fault with the comparative exiguity of his poetical production. It is a singularly vulgar calculation which measures the vintage of the "Côtes du Parnasse" by the gallon or the hogshead. But what is remarkable about all his verse is that character of "echo" which, with characteristic boldness, he acknowledged in the subtitle of a not small and a very charming part of it. The unrimed pieces which have seemed to some—not to me—to be his best things, owe the clearest royalty

[1] "In all adversity of fortune the unhappiest kind of misfortune is to have been happy."

[2] "Where abide now the bones of the faithful Fabricius?"

to Heine and Arnold: not without more indebtedness than some people would allow to Whitman. The French influence is to those who are in a position to recognize it equally indisputable, especially, of course, in those exercises in artificial forms for which I myself have (out of fashion as they now are) a very strong partiality, but the fashion of which, while it lasted, I do not hesitate to recognize as rather a sign of the absence of any newer and more genuine shifting of the wind of the spirit. Nay, the influence which some of Mr. Henley's admirers (not the most judicious) would most scornfully repudiate—that of Tennyson—is simply omnipresent; not, like the influence of Keats in Tennyson himself, transformed, absorbed, reprecipitated, but practically unassimilated and unchanged.

On this last point a curious excursive illustration which will not only throw light on our path but carry us further along it, occurs to me. Since Mr. Henley's death some one (I did not see the original suggestion, but only a reference to it) demanded the inclusion in all future anthologies of English poetry of the very pretty lines, "Bring her again, O western wind, over the Western sea." It was, of course, pointed out at once by the person (I do not know who he was) whose reference I saw, that this is merely a variation of Tennyson's exquisite song in the additions to *The Princess:*

> Sweet and low, sweet and low,
> Wind of the western sea,

a still further line being taken from the same poem, with only a single word's change. Now, Henley had frankly included this among his "Echoes," and there does not rest upon him the very shadow of a suspicion of attempting to play the upstart crow beautified with the Laureate's feathers. But there is at least some possibility of metaphysical connection between the ignorance of his admirer and his own impulse—not in this case only—to vary, rather than to create. And the tracing of this metaphysical connection may well occupy us in the remainder of this little paper.

Both things seem to suggest, tho in different and at first sight contradictory ways, that we are *too* "literary"—that the printed book is altogether too much with us. And if anybody with lightning wit retorts, "Surely literature and the printed book were very much too little with the gentleman who had never read or had forgotten *The Princess,*" let me humbly suggest that this wit has rather overrun itself. With persons of the lower order of sensitiveness to literature the immense volume of literary matter which attacks everybody to-day produces no abiding impression. They may—a great many do—read nothing but what is new. If they do read other things, one nail drives out another, one wave washes away what has been deposited by the last. They are disposed to accept, to welcome, to over-value refashionings precisely because they do not know or have forgotten the older fashions of the same. This of itself might constitute a certain temptation to the artist to be reproductive or ingeniously fertile in variations, instead of inventing; but I do not think it is of much importance. The more dangerous and the more effective influence comes upon him in another way. He has by the necessity of his own artistic sensitiveness taken impresion from all this literature, or as much of it as he has read, and he cannot get rid of it. It besets him, haunts him, obsesses him, as good old Sir Thomas Elyot very sensibly writes, and as we ought to write. When he calls, another Abra comes; and even if he is not repeating or slightly varying actual phrases, the tone, the mold, the form of older work abides with him and presses on him. When, as not uncommonly happens, he makes an effort to get rid of his familar by outlandish expression, by choice of unfamiliar subject, by tricks of meter or the like, the obsession mocks his efforts. "Yes! We're flitting," says the ghost in the cart.

I know, of course, very well—he must be a sorry student of literature who does *not* know—that this is no new thing in literature; and that tho a shrewd literary weather prophet can generally give a good notion when it is likely to come, the shrewdest never can tell how long it will last, when it will go and why Nay, going farther and perhaps to a dangerous extent, considering my present subject, it is a sufficiently well attested fact that the change, when it comes, generally comes not only not "with ob-

servation," but against it. Any day we may wake up and find ourselves with a really new poet, a really new school of poetry. But the fact is that we have scarcely had the one, and we have certainly not had the other for nearly forty years, nor the French for as long, if not longer, nor the Germans for the best part of a century—that is to say, since Heine's first appearance.

There are those, no doubt, who take cheerfuller views. I saw it stated with much satisfaction the other day that a new school of literature appears in France on an average in every fifteen years. If this be the case, I am prepared to admit that a new school of poetry, if not of literature, generally appears in England about every ten. But, then, this other person (who was evidently not joking) as evidently uses the words "new" and "school" and "literature" with meanings quite different from those which I attach to them[1]. And I am not sure that I should be disinclined to see in the confusion which must accompany such a pronouncement a fresh evidence of the contemporary inability to shake ourselves free from old fashions poetical, while imagining that one is in the enjoyment of the completest modernity. Contributory, too, is another curious phenomenon, the renewal of the old cry for attention to things of the present in poetry which Mr. Arnold gagged so cleverly just fifty years ago, when it last showed itself. No change of subject ever does much good in poetry, because, in fact, the subjects of poetry are always the same; never the actual, but always something transcending actuality, "more philosophical" than it, more serious, more lasting, greater. And the quest for new subjects, or, rather, the imposition of *modernity* of subject upon the poet, can only help to confirm him in the practice of resting in old treatment, of following the old models, of practicing, in fact, a sort of more or less eclectic echo-song.

So much for the symptoms and causes; it remains, I suppose, that one should say—one is at any rate sure to be expected to say—something about the cure. I have professed myself (in this respect only) a sort of faith-healer or fatalist-quietist. We (or some of us) shall wake up some day, no doubt, and find ourselves in presence of a new great deliverance, or we shall not; just as other generations have and others again have not had this experience of old time. For the rest the theory of the cure by similars, or, rather, identities, seems to be once more applicable. Better and more literature must cure what much and not always good literature has caused. More reading in the original; more reading of the best things; more comparison of different languages and periods and countries, may do something; tho I must own that these are rather counsels for the critic than for the poet. And, after all, the observer is not necessarily a prescriber, nor need his observations be the less useful because he does not prescribe.

That the observation itself is a true observation I am reasonably well convinced. Some day or other, when our fuller anthologies have stretched to the beginning of the twentieth century or later, the phenomenon is not likely to escape notice. We shall have plenty of good verse to show, and it will be of a more poetical quality than you find in such books as Dodsley and Pearch, for instance. But it will resemble Dodsley and Pearch and the work of the eighteenth century generally in being almost wholly shot through with identical threads of treatment and manner and style, instead of inhibiting the almost infinite diversity existing in these things, which, with some general resemblances, distinguishes the poetry of 1789-1870, as a whole, if not indeed quite throughout. I should like to see the termination of this period, the leaf turned over, the new leaf begun. The uncomfortable weight of experience and average is against my doing so; but you never can tell, as has been said, the times of the resurrection of the poetical John Barleycorn. And, after all, the old recipe is more applicable in poetry than in any other division of literature. You can always "read an old book when a new one appears," and there are so many old ones, and they are so good!

EDINBURGH, SCOTLAND

[1] I am not, of course, speaking of the new French experiments in prosody, which are interesting enough, but not to the present point.

France and the French People

A SYMPOSIUM

[The well-known Paris journalist, M. Louis Dumur, editor of the important international French weekly, *L'Européen*, has asked several score of prominent people to give him a brief opinion concerning the present condition of France and the French. We are able to print below the replies of some distinguished Englishmen and Americans, which are here published for the first time.—EDITOR.]

SIR GILBERT PARKER, M. P.

I SEE no signs of decadence in France. In every great city there accumulates the highest activity of national virtues and the lowest forms of personal vice, and Paris is no exception to the rule; but provincial France is as she has always been: sound and frugal in domestic life, industrious, vigorous, acute in business, patriotic without bombast, sympathetic with all modern progress, and quick to hear the footsteps of discovery and invention. Like other nations, France is passing through a period of unrest in literature and art, but that is due to the extraordinary impulses of scientific and industrial development. In science and industry France marches steadily and with foresight. A pioneer she has always been; she is still a pioneer among the nations. In Paris may be found the defects of her qualities, the defects of her temperament; but I believe that she is moving forward, and that the drain of her vitality—owing to the long Napoleonic wars—has been replaced by a new, abundant and progressive energy.

SIR LAWRENCE ALMA TADEMA.

I love France, and it would give me much pain to be obliged to admit that France is falling into decadence; nor do I believe that such is the fact, nor do I see any reason why I should think otherwise.

SIR EDWARD SASSOON, M. P.

I find it very easy to answer in the negative the question which you ask me. Look at its advance along an eminently peaceful road, at its alliance and friendly relations with three of the greatest European Powers, equally impressed with the advantages of peace. Eagerly laboring for the material progress of its land France has entered on an economic revolution which secures her against the trials and dangers of previous years.

Her future, then, is propitious. She resumes as her right a superior rank in the hegemony of the world, and, for my part—and it is the feeling of millions of my countrymen—I rejoice in this anticipation and in all the advantage which must result therefrom for justice and constitutional liberty.

SIR CHARLES DILKE, M. P.

In reply to the question of your excellent periodical I have to say that I cannot see that France, judged by any test, can be said to be "*en décadence.*"

It is, of course, obvious that the United States and (at an infinite distance) Russia are gaining on all other first-class Powers, while the British Empire and Germany are still advancing. France cannot now, I think, hope for any advance which can place her among the first four Powers of the future. But her arts are still the first and show no sign of relative decline.

ALFRED MARSHALL,

Professor of Political Economy, Cambridge University.

I think there is no room for doubt as to the maintenance by France of a place in the first rank of nations. Her economic energies, if less striking than those of two or three other nations, are of very high quality; and, as many writers have pointed out, her richest industries are less open to the competition of automatic or semiautomatic machines worked "massively" by large armies of workmen, chiefly unskilled, than are those of any other country. And further, the

"white coal" of the French Alps and Pyrenées may be supplying electrical power cheaply when black coal has become scarce. The disappearance of France from the first rank would leave a gap which no other country is exactly fitted to fill, and I see no sign that the gap will be made.

WILLIAM M. ROSSETTI,

Author and Art Critic.

The question which is asked is this: *"La France est elle en décadence?"* I am not qualified to enter into the question by passing in review a wide series of facts and drawing argumentative conclusions from them, but will simply express my own general conviction.

I refuse to think that that France which gave the world a beneficent shock in the eighteenth century by the great Revolution, and which was at the head of Europe under the most heroic genius of the eighteenth-nineteenth century, Napoleon I (who was, however, an Italian), and which has produced about the greatest literary, poetic and enlightening genius of the nineteenth century, Victor Hugo, can be in decadence in the earliest years of the twentieth century; especially considering that she has given herself a more advanced type of government, the republican, than about any other European country. The dominance of great and noble ideas, so prominent in France toward 1790, does certainly appear to have decreased, a retrogression which she shares with most other civilized countries in the world. For the rest, I see no decadence in France, except that, through intrusting her fortunes to an unprincipled and criminal adventurer, Napoleon III, she incurred a tremendous cataclysm and retribution in 1870-71, from which she rapidly rallied so far as was possible, and which she has nobly retrieved and is continuing to retrieve.

OSCAR BROWNING,

Professor of History, Cambridge University.

I had better confine myself to those matters with which I am most acquainted. It has been my duty as a student of history and politics for the last forty years and more to read a number of books in foreign languages referring to my studies, especially in French and German.

I used to look to Germany for enlightenment. I now look to France. Before the French Revolution England drew much of its inspiration from French sources. Hume, Adam Smith, and, above all, Gibbon depended on French culture and on French science. After 1789 we had for many years to seek erudition in Germany. Now every year the output of German historical and political literature becomes less important, and we turn again to France, who always gave us style and now gives us learning. May no doctrinaire insistence upon abstract theories tear up the roots of this delicate plant. Let us remember Tillemont and the Benedictines of St. Maur.

THOMAS HARDY.

In reply to your inquiry I would say that I am not of opinion that France is in a decadent state. Her history seems to take the form of a serrated line, thus:

and a true judgment of her general tendency cannot be based on a momentary observation, but must extend over whole periods of variation.

What will sustain France as a nation is her unique accessibility to new ideas, and her ready power of emancipation from those which reveal themselves to be effete.

W. L. COURTNEY,

Editor of the *Fortnightly Review.*

In answer to the question you propose to me, *"La France en décadence?"* I will reply by pointing to the admirable book of M. Hanotaux on this very subject. As you are doubtless aware, he traces in detail the various sources of the wealth of France, and proves how hopeful is the outlook for her in the future.

H. G. WELLS.

No! She is no more in decadence than a lobster which has shed its outgrown armor and has still to indurate its new coat of mail. She is renascent. In my "Anticipations" I have given my reasons very fully for believing in the great-

ness, in the future, of the French language, the French culture and the French people.

ANDREW D. WHITE.

At times France seems going into a decline, and then, in emergencies, shows such brilliant power that all prophecies are brought to naught.

I have just been reading the speeches of M. Combes with Anatole France's introduction; it fascinates me. Your new Prime Minister seems to me a wonder. There are doubtless arguments on the other side which influence good men like Ribot, but the speeches of M. Combes amaze me by their lucidity, strength, depth and foresight.

Winter Lyrics

BY THEODORE ROBERTS

I.

Pipe, bird, in the tamarind tree.
Pipe, wind, on the azure sea.
Here is the Season of Peace on Earth—
Pipe merrily.

Roar, surf, on the outer reef.
Sing, bird, on the plantain leaf.
Here is the Season of Joyous Living—
Have done with grief.

Whiter than snow the surf roars in.
In the tamarind tree the songs begin.
Out in the tumble of blue upstarts
A flashing fin.

Shout, surf, and pipe, wind;
Tho seas are wide, the world is kind;
Joy has a nest in the tamarind tree
For Love to find.

II.

Over the canefields breaks the day.
The boats are out, in St. Martin's Bay,
Sliding and plunging into the surf,
Seaward, to safety they bear away.

The dingy sails flap up, and fill;
The men at the wet sheets whistle shrill;
The salt wind buffets the sea and leaps
To the cocoanut trees on the crooked hill.

The planter's windmill, heavy and slow,
Swings its arms in the azure glow—
Waves a hand to the sea, and sweeps
The trampled canes in the yard below.

The chimney smoke-wreaths fade away
In the thin, blue sky of the sudden day,
And naked children play in the sun—
Fleeing the surf of St. Martin's Bay.

III.

The palms, wide-crested, and straight, and fine,
Swing and bow in a stately line.

The green canes rustle and clash and sigh
As the winter wind goes over and by.

The shutters creak in the breath of the sea.
The blackbirds hop in the almond tree.

Across the narrow fields of the poor
The women call from door to door.

Over the surf at the outer reef—
With skill and valor beyond belief—

The tiny fishing boats plunge and strain,
Race, and soar, and top the surf,
And win to the sandy shore again.

IV.

The lithe, brown children have gone to rest—
Shell-hunting over for one more day.
Purple the East, and purple the West,
And white stars over St. Martin's Bay.

The boats, dismasted, gunwale to side,
Sleep, and forget the turmoil and spray . .
A dreamless sleep till to-morrow's tide
Slips from the sands of St. Martin's Bay.

The shadows are black in the almond tree.
Our lamps gleam bright; our hearts are away—
Over the reefs, and over the sea,—
A thousand miles from St. Martin's Bay.

BARBADOS, B. W. I.

Literature

The Rise of Christianity

It is fortunate, indeed, that the important and brilliant work * of Prof. Paul Wernle, of Basel, should be in the hands of English readers in a good translation within three years of its publication in German. It is not strictly a history of the Apostolic Age, such as those of Weizsäcker and McGiffert, which treat the history of Jesus only in barest outline, but record amply the events after Pentecost with full criticism of all the New Testament writings. In Wernle nothing is said of the outward progress of the Church and its development in organization, nor of the critical reasons which justify the positions taken. Neither have we here a treatise in New Testament Theology; expositions of doctrine are secondary to description of men and movements. The work is a history of the rise of Christianity, and the historian is fortunate enough to begin with the real beginning of the history, the work of Jesus, and yet to carry the story through the period of the rise of the religion, in the broad outline necessary for its comprehension and the conciseness needful for its grasp. The book is an attempt to tell clearly and impressively the real meaning of the gospel as it stirred in the soul of Jesus, and the changes of necessity made in it by the missionary efforts in behalf of Jew and Gentile. Many statements will be questioned and disputed, and the book will appear to some arbitrary and unsatisfactory, simply because the author did not have space to give his reasons. But what is gained is far more than what is lost, and that is an animated, graphic description of the greatest movement in history, the rise of the Christian religion.

The importance of Wernle's book may be seen from his interpretation of Jesus, his estimate of Paul, and his striking use of the Apocalypse. Jesus is described as the Redeemer of men, who in a very real and practical sense lifts them from the life of sin and care to righteousness and peace and loving friendship with God. The self-consciousness of Jesus was more than human, and the union with God and feeling of Sonship attained by him is the goal of life, the object of all religion, and his help to that attainment in other men constitutes him the world Redeemer. His power, his self-consciousness and his humility cannot reappear in others, for Jesus was altogether unique in mission and in achievement. Yet he had his limitations, and was conscious of them; he did not profess to know the time of the world's end, but he wrongly anticipated it as quite near; a portion of the false Jewish Messianic idea remained with him; he was deceived as to the character of the Old Testament law, and thought it better than it is; his sinlessness is a dogma of the Church's creation, the result of the application to Jesus of the sacrificial system.

Wernle's treatment of Paul is masterly and is the most important section of his book. He maintains eloquently the greatness of Paul, and his pre-eminent service in broadening Christianity to a world religion. Before Paul there was a Palestinian sect, after him a faith for all men. Paul understood Jesus better, grasped his spirit more fully, than any disciple before him, or any that came after him. And yet the letters to Corinth and Colossae are not the teaching that shed light in Galilee. In his very loyalty to Jesus Paul was forced to be an apologist and to state the Gospel in new forms, and as a missionary he had to adapt the truth of Christ to the minds of his hearers. The Gospel suffered from a defense of Christianity against Jews and an appeal to Greeks. The Jesus of history, the friend of fishers and of publicans, the man of sunshine and joy, the humble teacher who felt hurt by the epithet "good," is presented to the Greeks in the mythical form in which

* The Beginnings of Christianity. *By Paul Wernle. Translated by the Rev. G. A. Bienemann, M.A., and Edited, with an Introduction, by the Rev. W. D. Morrison, LL.D. Vol. I. The Rise of the Religion.* New York: G. P. Putnam's Sons.

alone they were accustomed to conceive a man with a divine message. "St. Paul finally reaches the thought of Jesus, but in so dangerous and roundabout a fashion that the Jesus of history is completely swallowed up by the myth of the heavenly Son of God."

It will startle many to read that the Christology of Paul is conceived from the mythological point of view; that his doctrine of justification was a disastrous creation, the beginning of Catholicism and a return to the legalism from which he had fought his way out. But Wernle's view is one that must be reckoned with. It has long been felt that Paul was not infallible in exegesis—that he remained always something of a rabbi. Logically, then, free criticism of Paul's greatest doctrines and most important opinions must be admitted. The question is inevitable whether Christianity is Paulinism, whether it is to be bound forever to the thought forms necessary to the defender of Christianity against Judaism and the missionary to the Roman empire, under which forms of thought he conveyed accurately and convincingly the essential spirit and message of Jesus, but which we may find necessary to cast aside; that under different ways of conceiving truth we must present with something like the same exactness and the same enthusiasm the immortal message of the Galilean life.

Wernle attaches much importance to the Apocalypse, as the solitary surviving memorial of early Christian prophecy, the document which best represents the views prevalent among the laity in the period after Paul.

The essential truth and spirit of Christianity, Wernle knows well enough. He believes that to set this message free for contact with men's lives it is necessary to separate it from much which even its greatest messengers have added to it, and which has been considered part of its very essence. As to how he has performed his task there will be difference of opinion, and his plan of sketching in broad outline, without criticism of the sources, leaves room for many questions. But the movement of a mighty history stands out clear from this volume; here is at least one intelligible account of the rise of Christianity. It is a fascinating story, chaining interest and compelling admiration. No student of the New Testament can afford to neglect it.

Whittier

PROFESSOR CARPENTER'S recent addition to "The American Men of Letters" is an excellent specimen of critical biography.* It makes a clean, straightforward story, and withal an interesting one, of Whittier's life. It disengages the tendencies of the time, which was during his early manhood and middle age a singularly perplexing one, from the clutter of circumstances which tend to overlay and mask them. It elicits the leading motives of his action, his ideas and the significance of his career, and sets them out in distinct relief. And, above all, it submits his work and his writing to a discriminating, yet sympathetic, analysis and judgment.

The main outlines of Whittier's life are already pretty well known. It falls naturally into three periods of unequal length and importance; as a journalist and politician from 1829 to 1832, as a reformer from 1833 to 1860, and as a poet from 1861 to his death in 1892. As a politician there is little to be said of him. The main thing, as Professor Carpenter sees, is to rationalize his transformation from a shrewd, self-seeking local politician, such as he seemed likely to become in 1833, into an unselfish and resourceful reformer. The motives of this remarkable change are found on investigation to be few and simple—the altruistic sentiments of the day in combination with the natural exaltation of the New England character, and, in particular, his failure of health and the subsequent worldly disappointments, which threw him back upon his better and deeper self. In regard to the second period Professor Carpenter insists very properly upon the principle of lawful revolution and change which underlay all his projects of reform and which distinguished him so remarkably from the many enthusiasts and fanatics of his day. At the same time he gives due credit to the elasticity of the man, which enabled him to recognize that practical statesmanship is very largely a matter of expediency, and, while holding to his point,

* JOHN GREENLEAF WHITTIER. *By G. R. Carpenter.* Boston: Houghton, Mifflin & Co. $1.00.

to adapt his ways and means and even his convictions to the exigencies of the moment, when they were important enough to justify the compromise. It was this peaceful level-headedness which formed his important contribution to the early history of abolition and made him seem so comparatively uninfluential and inconspicuous amid the passion and violence of the subsequent struggle. In contrast with this eminently practical, tho peaceful, sense, however, his poetry, which begins with this period, is largely the result of a gentle reminiscent regret for his vanished and irrevocable youth, an illusory and idealizing mood, into which he slipped as soon as he ceased from his more active labors in behalf of reform.

Finally, without exactly insisting upon it, Professor Carpenter clears up the moral of his life, which is, after all, the main lesson of a biography. From this point of view the narrowness of his circumstances becomes of striking significance. Constantly hampered by poverty and ill health, he was confined for the greater part of his days in a little country town, outside of the world and beyond the stream of modern culture. Nor were his acquaintances, tho numerous and earnest, of a sort to supply his deficiencies. And yet he was, for all these disadvantages, a *magna pars* in one of the greatest moral movements of our civilization and is further one of our five or six greatest poets. How little apparent opportunity a great man needs to do a great work in the world!

The New German Art Criticism

THERE should be no need for a new work to be defending and expounding the works of Raphael, Leonardo and Michael Angelo, yet an observer of fashions in taste can hardly have failed to notice that in the great interest of the day in the Quattrocentisti, in Botticelli and Filippino and Luca and Donatello, the men of the High Renaissance have suffered eclipse. The very perfection of their art has made it seem to lack vivid interest. In their enrichment of the field in which we employ the visual sense they killed the power of enjoyment of the simplicity of life represented in art. We went back to the primitives for mere fresh sensation, then we discovered their particular excellences, and now we shall rediscover those of their successors in the era following, if an age that prefers Kipling and Conried to Pater can be brought to feel pleasure in Raphael's calm perfection.

Herr Wölfflin* leads a reaction against this preference for the fifteenth century. By careful analysis of the changes in all directions with the turn of the century, he makes us feel with unusual force the value of the evolved work of the first twenty-five years of the Cinque Cento—the Classic Age—using the word to mean the moment of completion in Italian art effort, which occurred between 1500 and 1530.

Studying the works from the side of the craftsman rather than that of the usual translator of painter's thoughts into those of the everyday world, he is convincing in his arguments against overestimation of the Roman classic influence at this time. He explains the change in the very movements of life that affected appearances in art—the passing from descriptive to dramatically poised treatment, the "system of purification, of exclusion of all details that did not help toward the whole, the selection of a few grand forms," . . . ." the great leading lines playing a prominent part," the suppression of the nervously active "rippling, rustling, murmuring" folds, so much a part of the preceding style—in short, the contrapuntal art of the sixteenth century. His instances of the many differences are very interesting. The delicately touching fingers of the Quattro Cento, never by any chance grasping a thing firmly, are contrasted with such hands as those in Andrea's "Madonna delle Arpie," or in Raphael's St. John, in the "Madonna di Foligna," and other such easily understood comparisons are made. He limits his field to the consideration of composition in line and mass, especially in the schools of Florence and Rome, leaving for a future study the mode of thinking of the colorists. The book is delightfully clear and concise, and

* THE ART OF THE ITALIAN RENAISSANCE: *A Handbook for Students and Travelers. From the German of Heinrich Wölfflin, Professor of Art History in Berlin University. Preface by Sir Walter Armstrong.* Illustrated. New York: G. P. Putnam's Sons. $2.25 net.

his presentation of the characteristics of the men analyzed is fresh, and stimulates to renewed interest in them.

Herr Wölfflin's idea throughout is similar to that employed by latest criticism in the treatment of the great age in Greek art. Through a long archaic time certain motives come to be handled with the ease that gives the artist power to use each one with its quintessence of expressiveness, and thus a classic art is produced. He leaves with us his expressed regret that there was never produced the one great monument that might have been as perfect an expression of that early part of the sixteenth century as was the Parthenon of the Athens of Pericles.

The Deliverance*

THE heart of mankind is really very old. There is nothing new in it, and there never will be. We have the same passions that damn us from age to age, and the same aspirations that bound Prometheus to his crags. A new dimension added now and then to mind changes our emotional manifestations, or represses them, but that is all. And it is a matter for regret that some writers do not recognize this fact. Apparently they regard fiction as a field for exploiting biological hallucinations, and they have read more romance into flesh and blood, more dastard lies into consciousness, and more madness into motives than the human heart is capable of in actual experience. And this paranoiac imagination is peculiar to Southern authors of late years. With few exceptions, the Southern gentleman is represented as an extraordinary product of Divine courtesy, granted a faculty for immorality without compunction, but equally endowed with virtuous aspirations and autocratic emotions—the latter warranted to ignite upon the smallest provocation and envelop the whole romance in flames or bloodshed; in short, differentiated from his kind by a superlative degree in everything, which he does not really possess. And the whole world knows how wearied everybody is of these literary prevarications of human nature in the South. But there is a deal of difference between a novel written from this narrow, provincial point of view and a romance of provincial life. The former is always a failure, while the latter may be a masterpiece in dramatic art—a statement that brings us to the proper literary angle from which to view *The Deliverance*, a romance of the tobacco fields in Virginia twenty years after the Civil War. This is an interpretation of Southern life in a rural neighborhood, to be sure; but it is written out with that touch of nature which "makes the whole world kin"—kin in avarice, crime, love and triumphant virtue. All the ancient elements of our common nature are exposed—from the malicious fortitude with which Susan Spade lived up to her doctrine, "What's the use of bein' honest if you can't p'int your finger at them that ain't!" to Tucker Corbin, who was disposed to cover every man with the mantle of his charity. But they are so dramatized as to represent progressive stages of civilization in the South. And it is a unique performance, in that the author does not confine her demonstration to historical accusations against the North, as is the usual method of these writers; but each character is like a different photograph of the same situation. Thus Madam Blake gives the point of view held by the ultra-aristocrats. "Love making, I have always heard, should be the pastime of the leisure class exclusively," was her unscrupulous opinion. The measure of social morality in her day may be inferred from this comment: "Oh! the family was all right. I never heard a word against the women!" And at the very end of all things she concluded with this audacious but noble testimony:

> "I am not afraid to die, for I have never to my knowledge done anything unbecoming a lady. Remember to be a gentleman, my son, and you will find that that embraces all morality and a good deal of religion. . . . Your Uncle Bolivar used to say, 'I may not sit with the saints, but I hope to stand with the gentlemen!'"

Like the figure in a fine old portrait to which forty years have already given the tone of time, this old, tight-waisted gentlewoman, seated in her Elizabethan chair, furnishes the story with the costume, personality and perspective of an elder day.

* THE DELIVERANCE. *By Ellen Glasgow.* New York: Doubleday, Page & Co. $1.50.

Fletcher, the fat scamp who appropriated the Blake estates, is an obsession of villainy incident to the unsettled condition of the times, and is of no importance, altho the character is well portrayed, except as his greed and brutality affects the lives of those about him. And Christopher Blake, the hero, will not appeal to the average reader; but when we consider that his passions, his half degradation, his furious struggle with unnatural poverty, represent the transition period in the South, the character becomes significant. Twenty years after the war, young men, whose fathers begot them gayly in the insolent profligate past, were forced to learn modesty, patience and a new kind of courage between furrows. And so, born to the saddle, with the spirit of dominion changed to fever in his blood, Christopher Blake toils in the tobacco fields, curses the heavens and the earth with impotent rage, and in the supreme moment proves his real mettle with a sacrifice which required more courage than his earlier ancestors carried with them on the battlefield. And, indeed, if the Southerner has any distinction over other men, it is his peculiar fitness for the supreme moment. Apparently he does not show off to any great advantage in the even tenor of life, but he is a genius and a hero when it comes to emergencies. However, it must be admitted that at this point Miss Glasgow has marred the symmetry of her story with a *denouement* out of all proportion to preceding events. Christopher's renunciation of life and honor for the man whom he imagined he had wronged is eloquent, dramatic, but by no means necessary.

The contention of some that *The Deliverance* is not equal to Miss Glasgow's other novels is a criticism that may be sustained so far as the story goes; for she is too much interested in the development of individual characters to fit the different elements together in a swiftly moving action. But this is a fault easily forgiven when we consider that each person's life portrayed is a complete drama in itself. Besides, this representation is not far from the truth of things. No community life is so co-ordinate, so compact, as to make a good play if it were actually dramatized. In this novel the one common element of interest is the tobacco fields. These are like green inland seas across which the wind sends a thousand leaf waves. And soon or late every character in the book is drawn into some sort of contrast with this emerald surface, either scenic or dramatic.

The Foe of Compromise, and Other Essays. By William Garrott Brown. The Macmillan Co. $1.50.

This little book of essays is a collection of articles that have appeared in the *Atlantic Monthly*. The first is a philosophic defense of compromise, in which the author has in mind the famous political compromise of 1850. The foe of compromise is, the author conceives, a demon inhabiting every human breast. Happily for the world it lies dormant in some, in others the demon asserts himself, only to be throttled after a struggle. Some men like Garrison are completely within its power. Such men are necessary at some crises of the world's history, but they are uncomfortable men, "disregarding all that the long experience of mankind can teach concerning the way to live best in this world." The object of the essays is to show the usefulness of compromise, its absolute necessity in all the relations of life—in friendship, in love and in business. Without compromise a man can not do real work in the world. In the second essay Mr. Brown denies Mr. Bryce's assertion that in America "neither party has any principles, any tenets." He demonstrates by a rapid survey of the political history of the United States that there have been, under changing names, two great parties with fundamental principles to which they have been tenacious throughout. The third essay, "The Task of the American Historian," is as philosophical a bit of criticism as Woodrow Wilson's history of the United States had drawn from historical writers. It criticises adversely, but with generous appreciation, and takes occasion to examine broadly the true aim of the American historian. We see in this essay evidence of an inspiring and sane reaction against German ideals in historical work. The last essay, "The Great Occasions of an American University," reviews the past of Harvard, and interweaves descriptions of the institution as it looked

on certain "great occasions." This essay, as the others, conveys to us a beautiful enthusiasm for culture and the charm of Mr. Brown's personality, which is in his previous work, both as an historian and a novelist.

History of Coinage and Currency in the United States and the Perennial Contest for Sound Money. By A. Barton Hepburn. New York: The Macmillan Co., $2.00 net.

The conclusion drawn by Mr. Hepburn from his elaborate investigation of our financial history is that every generation has had to learn for itself the evils of unsound money. The colonies wallowed in the mire of irredeemable paper, and the Continental Congress plunged in the deepest of all. The generation of statesmen who framed our Constitution succeeded in preventing the State governments from indulging in such debauchery for the future, and supposed that they had also restrained the general Government. The Civil War broke down constitutional restraints, and, in spite of the frightful cost of the greenbacks, every attempt to retire them has failed, while the Supreme Court has held that they may be issued at the will of Congress. Future generations may yet suffer from the exercise of this power. What the State Governments could not do directly they very soon proceeded to do indirectly. They chartered banks without number and without safeguards, and the currency of the country was abominable until the exigencies of the national Government caused it to extinguish State banks and substitute a national system. With all its defects, this system has at least furnished the country with currency which could be accepted without scrutiny, and which has involved no loss to its holders. The system needs to be improved by copying the enlightened principles adopted by our neighbors in Canada, when it will probably be permanently established. The prolonged agony of the struggle of the intelligent business men of the country to restrain the pernicious activity of their legislatures, and the humiliating efforts of legislators to propitiate ignorance and dishonesty without ruining the country, are set forth at too great length by Mr. Hepburn. Professor Sumner and Horace White have pretty well covered the ground, and their works have a greater scientific value than this. There may be some convenience, however, in having the annals of the "perennial contest" detailed at some length, and those who read this book will get a fairly correct idea of the general course of events. Mr. Hepburn does not write as a controversialist, and, while his own point of view is evident, it is not obtruded. An appendix, containing copies of many important laws and reports, is a valuable feature of this work.

The Unreformed House of Commons. By Edward Porritt, assisted by Annie G. Porritt. Two vols. The Macmillan Co., 1903, $7.50.

As regards the making of this book, one of the most interesting facts is that the authors found abundant material in the libraries of this country. When we observe the enormous mass of minute details, often of the most technical and recondite character, which are here collated and set forth, we may well think that our progress has been as great in supplying scholastic apparatus as in the development of material appliances in general. Be this as it may, the book is a fine piece of historical work, and it deserves far more extended notice than we are able to give it. The authors trace the history of the parliamentary franchise from the earliest times, through shire and borough, with full particulars of the changes and their causes, not neglecting to aid the reader by carefully drawn maps. In early times, to send representatives to Parliament was generally regarded as a burden by the constituencies, and to be sent was thought a hardship by the members. They frequently demanded that the constituencies should pay them for serving, and in some cases boroughs obtained relief from this burden by getting altogether excused from sending a representative. So long as this was the tendency the franchise was not greatly restricted. It was felt to be a rather undesirable responsibility, and those who were charged with it had little disposition to allow exemptions or to monopolize it. Very gradually a seat in Parliament came to be desirable. It not only conferred social distinction, but pecuniary profit. All sorts of places in the

civil service, in the army and in the Church, all manner of pensions and sinecures, were available to members of Parliament, and the possessors of the franchise came to realize that their suffrages had substantial value. As was natural, those who failed for any reason to maintain their rights became perpetually excluded, and the franchise was held like a hereditament. On the other hand, the possessors of it frequently saw that money was to be made by extending it, and admitted "honorary" freemen by the hundred and even by the thousand. Parliament itself engaged in the delicate task of regulating the franchise, not by general law, but for particular places. The abuses which resulted were of the most diversified and often absurd description, but were so buttressed by the combination of selfish interests as almost to need a revolution for their overthrow. In spite of the remoteness and asperity of the subject, the authors have made an extremely interesting and in the main readable book upon it; a book which is scholarly without being tedious, and which really constitutes an epitome of the political history of the United Kingdom.

Long Will. By Florence Converse. Boston: Houghton, Mifflin & Co., $1.50

This is a story in which William Langlande, author of the famous series of poems which appeared during the latter half of the fourteenth century under the title of *Piers Ploughman,* is the pervading spirit. An attempt has been made to reflect the popular feeling of the period: its great social and religious movement; the deep-seated, brooding discontent of the people with the condition of affairs in Church and State, and the ultimate revolt of the peasantry under the leadership of Wat Tyler. The tale, which is quaintly told in archaic style and with considerable skill, shows careful, painstaking research, as well as no little poetic feeling. It has to do principally with historic events, but a local habitation and a name have been given to Langlande's legendary daughter, and it is Calote's pretty romance with King Richard's favorite squire that furnishes the most moving matter in the book.

Pebbles

HERE is one thing about the average resignation: it is accepted.—*Atchison Globe.*

....*He:* "May I imprint a kiss upon your hand?" *She:* "No; that would be quite out of place."—*Exchange.*

NOT SNEEZING.—"Has your father a bad cold?" "No, indeed. He is merely reading the Russian-Japanese war news aloud."—*Washington Star.*

....'04: "There was a fellow in my section on the sleeper that had smallpox." '05: "I'll bet you gave him a wide berth."—*Harvard Lampoon.*

....There is a good deal of discussion of the Russians, owing to the war between Russia and Japan. One man said to-day: "All I know about Russians is that they smell like sheep."—*Atchison Globe.*

....In response to our questioning as to the success of the woman minister, in what it consists and how far it can be attributed to her sex, a Southern brother writes of one: "She was 'peculiarly successful' in getting married to the Methodist minister of the town; and this I 'attribute to her sex.'"—*Congregationalist.*

Said the Japanese Admiral Togo,
To the Russian Admiral Volganovoremyanish-
ninevgorodovskivitchivogo,*
"If you think that you can chew
Up the innocent Manchu,
You will jolly soon find it is no go."
[*Pronounced "Vogo."]

THE HORRORS OF WAR.

When the battle ship "Obslavsky"
Meets the cruiser "Okamuro"
And the war ship "Pietropavsky"
Bumps against the "Shikoshuro,"
Ah, the sea will then turn ruddy,
All the decks will then be bloody,
And the anxious world will waitsky, for the
newsovitch with dread;
There will then be aitch to paysky,
And the ones who get awaysky
Will have thrilling tales to tellsky of the
bloodovitch they shed.

When the mighty "Shikoshimo"
Rams the great "Kovanokoff,"
And the helpless "Hakorimo"
Gets it from the "Horsemoff,"
Ah, 'twill be a fearful fightsky,
Many a soul will take its flightsky
To the realmovitch in which the ones who
go beforeoff dwell!
Who may guess the endomuro?
War is hellskyvitch forsureo,
Even tho a rose may bloomsky where a hero-
vitch once fell.
—*Chicago Record-Herald.*

Editorials

National Candidates and Issues

We believed that Mr. Hanna meant what he said in response to all suggestions that he should become a candidate for the Presidential nomination. When powerful capitalists who resented Mr. Roosevelt's attack upon the Northern Securities merger, and his intervention to restore peace at the anthracite coal mines, urged the Senator to seek the nomination, he declined because (first) he was loyal to the President, and because (second), being a politician of much experience and common sense, he knew that such a contest as he was asked to make would defeat his party at the polls. If he had lived, the President would have been nominated and would have had his support in convention and campaign. Therefore his death does not really affect the political situation except by depriving the party of his services and advice. Before his death there was but one candidate for the Republican nomination; there is but one now.

On the other side more than 6,000,000 votes will be cast in November next for some one; but who can tell now the name of the candidate or point out the issues that his party shall declare to be paramount? Mr. Cleveland, cordially hated by a large portion of his party, declines the support of those who admire him. Mr. Gorman is discredited by the failure of his leadership in the Senate and by a loss of influence in his State. Judge Parker, unknown outside of his own State, is opposed by the men who control the party in it. Mr. Olney, living in a State that is hopelessly Republican, must contend against the hatred that Mr. Cleveland has excited. Mr. Bryan, lecturing industriously upon what seem to him to be moral issues in politics, appears to be relying upon Mr. Hearst and his barrel (which Henry Watterson has discovered in Kentucky and elsewhere) for power to control one-third of the delegates, and thus to prevent the nomination of any one whom he does not like.

Bearing in mind the extreme bitterness and the number of Mr. Cleveland's Democratic foes, will any unbiased student of practical politics say that he could be nominated if he should permit the use of his name, or that, if nominated, he would receive three-quarters of the normal Democratic vote? Can the politically unknown chief judge of New York's Court of Appeals, when opposed by the Democrats who will control his State's delegation, expect to convince the Democrats of other States that he is the man to defeat Mr. Roosevelt? Would the nomination of Mr. Hearst excite enthusiasm in the States that are essential, or call back the conservatives whom the nomination of Bryan drove out of the party? We should be glad to see a harmonious, orderly and sane Opposition. But the man to unite and lead the Democratic factions is not yet in sight.

Mr. Cleveland is convinced that there is now an opportunity for Democratic success. "Broken pledges and forgotten promises of reform," he says, "vex the sight on every side;" popular distrust and fear "prevail everywhere in the land." If the opportunity really be so inviting as he thinks it is, his party can take advantage of it only by setting forth a lofty and conservative platform as well as by nominating a candidate who will inspire confidence and be an issue in himself.

But the difficulties which threaten to prevent an agreement upon such a platform are not less formidable than those which have thus far concealed the strong and sound man whom the party could be induced to place upon it. Free silver might be laid aside, as Mr. Williams suggests, if the Bryanites would be reasonable. Anti-imperialism, as defined in the platform and campaign of 1900, is politically somewhat out of date. Republican purposes with respect to the Philippines, as foreshadowed by the President, Mr. Taft, Mr. Root and Mr. Moody, do not now invite a sharp partisan attack that could win any votes. With half the Democratic Senators voting for the canal treaty, the Panama question ceases to be

an issue that has any political value for the Opposition. A majority of the American people will not follow Mr. Gorman in asking that naval construction be checked. Demands for economy and denunciations of official corruption are political platitudes, altho the Republican party will rightly suffer if it shall be shown that it has failed to prosecute the guilty. So far as labor questions are concerned the President is comfortably intrenched behind the Miller case and the Anthracite arbitration. Democratic platform utterances about the negro might please the South, whose vote is secure, but in the North would probably do the party more harm than good. The personal argument against Mr. Roosevelt, which some Democrats now regard with much favor, is one that the party should approach with caution, remembering that those in the Republican party to whom he is "unsafe and reckless" represent doctrines and tendencies which the Democracy must denounce.

There remain to be considered, of the prominent questions, the tariff and the corporations, and especially the latter as related to import duties and restrictive legislation. Here is the most inviting field for Democratic effort. With the slight but quite perceptible decline from a period of boisterous speculative prosperity, these questions now attract the attention of thoughtful men. The cost of living is high, but wages are no longer rising. In some industries they have fallen. Great combinations that keep prices high at home and sell at much lower prices abroad are now objects of popular enmity and attack. There is a growing demand for a revision of that tariff which enables them thus to discriminate against those who gave them highly profitable protection.

Up to the present time the new publicity laws aimed at great manufacturing corporations have been of no account. Mr. Roosevelt's suit against the railroad merger commends to the public his courage and fidelity, but the masses desire that manufacturing combinations shall be subjected to restraint. The President's argument that small competitors of great combinations would be ruined, or would suffer more than the combinations themselves, by a reduction of tariff duties affecting their products is not generally approved. Upon various phases of these questions concerning the tariff and what are commonly called the Trusts the Democratic party, wisely led, could make a very formidable campaign. The result of it could not be clearly foreseen. But the force of a sane and powerful utterance on these questions could easily be neutralized by association with dead and discredited issues, the vagaries of Populism, and an unworthy ticket.

Teachers and Doers

THE closing paragraph of Mr. Mosely's report on education in the United States deserves especial attention, since it bears upon a debatable point, and many college authorities have not yet adopted the policy he commends:

> "In an English technical college the professors are frequently required to give their whole time to the teaching duties of their post, and are debarred from undertaking outside professional work. The result is apt to be that they lose touch with the practical needs of manufacturing industry, and that their instruction takes on an academic tinge which does not make for the efficiency of their pupils in actual industrial work. Far better is the American practice of not merely allowing the professors to take outside work, but even regarding them as something of a failure if they do not get plenty of such work to do."

That this is the policy of some of our best technical schools is true, but in many technical schools, especially where these have been annexed to the traditional college in response to the demands of the age, the old prejudice in favor of a cloistered scholarship yet prevails, and the instructors are more or less explicitly prohibited from "engaging in gainful pursuit," as it is elegantly expressed.

Now, where a professor has nothing to do but to profess, his task is an easy one, and chairs in such institutions are apt to be filled by those who take naturally to a sedentary life. Here we find professors of agriculture who would starve on an eighty-acre farm, and professors of stenography and bookkeeping who cling with desperation to their positions in the college because if they lost

them they would never be able to get a job in an office.

The American youth is not well endowed with the qualities of respect and admiration, but what he has of these he usually reserves for those of his instructors who can do things. In passing from one class room to another this is very noticeable. The intentness with which the medical student leans over the railing and watches the movement of the surgeon who is performing an operation, and the attention he pays to the lightest word and the not always exemplary jokes of a man who is called to the ends of the earth when a war breaks out, contrast strongly with the sleepy atmosphere of other class room, where the students have to be continually prodded by various pedagogical devices to keep up even the semblance of interest. The students in mining engineering do not think any the less of their professor because in his last vacation in the mountains he got twice his college salary for the inspection of a mine. The president who leaves his work for a year to serve on a national commission or help in making an important treaty is serving his college as efficiently as his predecessor who confined his work to the teaching of moral philosophy and formal logic.

It is not, indeed, very long since a professor of political economy who invited a labor agitator to his house, doubtless that he might observe at close range the strange animal he described as a zoologist might wish to see an okapi, or a professor of sociology who lectured before a club of socialists, presumably that he might convert them from the error of their ways, was subjected to very violent popular criticism, in which he were lucky if the board of regents did not share.

Now, however, there has been some change in this respect; a professor is permitted without remonstrance to open his mouth on political subjects, unless he opens it too grotesquely. A man may gain a professorship in sociology by becoming a tramp, and in time it may be that one will not be considered eligible for the chair of criminology until he has served a term in the penitentiary. A teacher of dead languages is permitted to busy himself with living questions, and he is not regarded as disqualified for expounding the Athenian constitution because he has taken an active part in the affairs of his own municipality. Thus the barriers between the college and the world are breaking down, as are those between the Church and the world, and the policy Mr. Mosely commends is extending to other than technical schools. It may be that in time efficiency rather than proficiency will be regarded as a more important qualification of teachers in all departments.

China and the Eastern War

To one that takes a look far ahead the most important question that awaits answer concerns the future of China. Is China waking up? Will the conclusion of the war mean the preservation of the "administrative entity" of China, or will the empire be torn to pieces and devoured by the vultures? What have we to hope for China or to fear for her?

It seems to be a general opinion that China has learned no lesson from her defeat by Japan or from the capture of Pekin by the Allies. The old Empress Dowager is in control, and she is no convert to modern ideas, even if she does give tea parties to the ladies of the Diplomatic Corps. And yet one who looks back a few years may learn to his surprise that China has not been standing still.

Railroads are penetrating the interior of China. The American concession from Canton to Wuchang, in the middle Yangtze, connecting with the Belgian railroad from Pekin to Wuchang, will divide China into an eastern and a western half. The British and French are opening railroads in both halves. The Germans are working hard on their railroads and mines in Shantung. Over the Siberian Railroad a mandarin could, before war was declared, travel from Pekin to London in eighteen days.

The development of the post office, under Sir Robert Hart, has hardly been observed. We have under our eyes the Imperial Postal Route Map, reprinted in the Report of the Society for the Diffusion of Christian and General Knowledge in China; this map shows that the

post office reaches five hundred principal cities, covering the entire empire to the confines of Tibet. This alone means an advance over the time when steamers were not running on every river and when the dragon spirits refused to allow a railroad tunnel to be cut through a hill.

Perhaps the confession of a new spirit and purpose is best seen in the examinations which the young literati must pass for their degrees. Here are some of them for last year. In Honan: "What improvements are to be derived from the study of foreign agriculture, commerce and postal systems?" It is a great thing to have the idea admitted that any improvements are possible. In Nanking: "What are the chief ideas underlying Austrian and German prosperity?" In Kiangsi: "What is the bearing of the Congress of Vienna, the Treaty of Berlin, and the Monroe Doctrine on the Far East?" In Shantung: "What is Herbert Spencer's philosophy of Sociology? Define the relations of land, labor and capital?" In Fukien: "What Western nations have paid most attention to education, and what is the result?" In Canton: "How to get funds and professors for the new education?" In Hunan: "What is the policy of Japan—only following other nations, or what?" In Hupeh: "State the educational systems of Sparta and Athens. State briefly the geological ages of the earth, and the bronze and iron ages." These are samples of hundreds of questions.

One of these questions recognizes the development of Japan. Every watchful student must observe the immense and growing influence of Japan on Chinese education during late years. It has developed into a real propaganda which has powerful support from Japan as well as from influential Chinese. Even altho this influence is not Christian, it yet has absorbed much from Christianity. But the influence of Christian missionaries in China is much increased since the siege of Pekin. In the province of Hunan, which boasted ten years ago that it did not contain a foreigner, and that if any entered he would be cut in pieces and eaten by the enraged people, there are now over fifty Protestant and Catholic missionaries living in perfect peace, and foreign schools and colleges opened by the Governor in the capital and by missionaries in the various prefectures. In the province of Shansi the literary Chancellor urged the students to give up opium, to study the Christian sacred books and publications of the Society for the Diffusion of Christian and General Knowledge, so as to get some knowledge of universal civilization, and to distinguish clearly between the Catholic and Protestant religions, as their bearing on civilization was very different. Of the 16,000 Protestant misionaries in the world, 2,700 are in China, mostly English and American.

Is it no sign of progress that leading Chinese, like Wu Ting-fang, protest against the practice of binding women's feet? The Governor of Hunan and the Viceroys of Chihli and Szchuen have lately issued proclamations condemning the practice.

Before 1895 the only newspapers in China were those published in English, one in German, and a few missionary papers in Chinese. During the Reform movement of 1896-8 sixty political papers were started in Chinese, besides a German, a French and a Russian paper, while the Japanese have started journals in the principal cities, and all in the Chinese language, for the purpose of enlightening the Chinese people as to Japan and the new civilization. Such influences must have wide results.

These changes and this advance have marked the progress of China in these last half dozen years. They are the first step, the step that costs. We may expect a mightier change in the next ten years. Under the tutelage of Japan and the influence especially of English and America instruction in science and the arts of life a new China will arise, and one which, if not speedily dismembered as the result of Russian victory, will develop a powerful and yet peaceful nation, able to hold its own and protect its territory against any neighbors, however powerful. This we can be assured of and must anticipate, if Japan is able to resist the advancing pressure of Russia in Korea and Manchuria. The result of the war is most ominous, or most hopeful, for the Chinese Empire.

Will Loisy Repudiate His Book?

THE Congregation of the Inquisition has informed Cardinal Richard, Archbishop of Paris, that it will not accept the reservations which the Abbé Loisy has attached to his submission. *Le Temps* says, on the authority of a priest, familiar with the situation brought upon the author of "*L'Evangile et l'Eglise*":

"Entirely true is it that the Sacred Congregation of the Inquisition has decreed as insufficient the letter addressed to the Cardinal Secretary of State by the Abbé Loisy. Last Saturday morning [January 23d], in an interview at the Episcopal palace, Abbé Loisy received this news. Cardinal Richard demanded of him a retraction, pure and simple, full and entire, including the condemnation of his methods, the reprobation of his books, the discontinuance of his lectures at the Sorbonne and the promise to abstain from publishing anything without first submitting it to the ecclesiastical authorities. I know not as yet the Abbé Loisy's reply."

From these statements it is clear that the demands of the Holy Office give a new turn to the case. In exacting of the best known Catholic exegete of our day the condemnation of historical methods and of criticism, the Inquisition most unfortunately reopens the conflict which it began in the seventeenth century in condemning astronomy in the person and works of Galileo. Says the Catholic informant of *Le Temps:*

"The disturbance is now the more serious, inasmuch as it bears upon the ground work and proofs of Catholicism. The Roman Church is an historical fact, the institution established by Christ, the Wonder-worker and 'Son of God.' By putting an end to the study of this fact, the history of her foundation, the life of her founders, after the method which offers a certain explanation of past events, and by demanding for the Gospels, books written and handed down by men, a special treatment [*un traitement de faveur*], the Holy See raises for many a day the protest of scholars and the skepticism of people."

In fact, Catholic controversialists show clearly that it is not the person of M. Loisy which is in question, but the method itself. M. Loisy, now looked upon as excommunicated, is not to be refuted. Other weapons are used.

Père La Grange, a learned but prudent exegete whom Loisy's logic had shocked, has just been denounced as heterodox in a series of articles in *La Verite Française.* Monsignor Mignot, tho Archbishop of Albi, is treated in the same way for the essay which he published in the *Correspondant* (December 10th, 1903). La Grange is a Dominican and president of the School for Sculpture Study in Jerusalem. It is believed that the Jesuits inspired this attack on La Grange. The Dominicans have the exclusive right to the Rosary leaflets, Indulgences, etc. About twelve years ago the Jesuits began printing monthly Rosary leaflets as a part of the Sacred Heart devotions and the Apostleship of Prayer. Some four or five years ago, at the instance of the Dominicans, they were forced to stop this practice. The monthly leaflet is kept up, but without the Rosary mysteries. Thereupon the Jesuits started in to expose the myth of St. Dominic getting the beads from the Blessed Virgin. In the London *Tablet* the controversy went on for quite a while, chiefly between Loescher, a Dominican, and Thurston, a Jesuit. This last even sent an article on the subject to the *American Scientific Supplement.* No doubt the Jesuits had the best of the argument. In the long run, however, it will wind up in Catholics burning their beads. The Dominicans are now being punished over La Grange's shoulders.

The friends of Abbé Loisy believe he will make further defense of his position in a letter to the Papal Secretary of State.

A Trust Not Trustworthy

"As long as grass grows or rivers run" was the old refrain of Indian treaty makers. "Inalienable for twenty-five years" was the *leitmotif* of the law of 1887, which gave allotments (and citizenship, too) to Indians. Mortgages, taxes, deeds of gift or sale were alike to be void during this trust period, and at its end his tract was to be conveyed by the United States to the Indian allottee "free of all charge or incumbrance whatsoever."

The Indian has already learned that forever is too long a term for a treaty, and disquieting doubts as to the stability of even a twenty-five-year promise have recently sprung up owing to a decision

of the Secretary of the Interior, made in 1900, that he has authority to cancel a trust-patent at any time prior to the expiration of the twenty-five years.

Of course, it is assumed that such authority is to be exercised only to correct an error or where the Indian has failed to be honest in his relations with the Government, which, on the face of it, is fair enough. But the danger is that this proclaimed insufficiency of a trust-patent to protect *per se* the holdings of an Indian allottee will invite contests over allotments. If the contest is shrewdly postponed until near the expiration of the twenty-five years the Indian may by that time have lost, by death of witnesses, etc., evidence of his right to the allotment which he has been occupying, improving and considering securely his own. In any event, with money, politics, a knowledge of English and of legal technicalities all on the other side, the Indian is ever at a disadvantage when he appeals for his rights to the courts.

Therefore, with this and other arguments, the Mohonk Conference, the National Indian Association and the Indian Rights' Association have been agitating the need that a definite limit be set to the power of the Interior Department to set aside a trust-patent; and we are glad to know that the Indian Committee of the Senate has favorably reported a bill (No. 1974) which covers that ground. It provides that no Indian trust-patent shall be canceled, without authority of Congress, except when a double allotment is made by wrong or error, or when a mistake has been made in the description of the land inserted in the patent, or when a trust-patent has been relinquished by an allottee or his heirs in order to take another allotment. This legislation, which has the hearty support of the Commissioner of Indian Affairs, will, we hope, be placed by this Congress on the statute books.

A trustee with unlimited power needs an especially enlightened and sensitive conscience to administer his trust righteously. Such power over Indians was conferred upon the Government a year ago by the "Lone Wolf decision" of the Supreme Court, which bids fair to become even more famous than the Standing Bear case of a quarter of a century ago. The court said:

> "The power exists to abrogate the provisions of an Indian treaty; but presumably such power will be exercised only when circumstances . . . demand in the interest of the country and the Indians themselves that it [the Government] should do so . . . particularly if consistent with perfect good faith toward the Indian."

The first practical application of this newly enunciated principle is just being made by Congress, and forthwith

> "self the wavering balance shakes."

Gregory County, South Dakota, wants 416,000 acres out of the treaty reservation of the Rosebud Sioux. In September, 1901, while insisting that it was worth much more, the Indians agreed to sell it at $2.50 per acre if the Government would be responsible for the lump sum. But Congress was unwilling to add a million dollars to the appropriation bill and wanted the Indians to take their pay out of the delayed and uncertain proceeds of the sales of the lands to homestead settlers. So last summer another agreement was attempted. But even when the price was raised to $2.75 an acre (to make up for the inevitable loss from delayed and defaulting homestead payments) it was found impossible, after weeks of effort, to secure the three-fourths majority which, under a former treaty, is required for the alienation of tribal lands. But Gregory County is still clamorous, and the House has paraphrased the Lone Wolf decision into: "If the Indian can sell and won't sell he must be made to sell—and at our price." It has sent to the Senate a bill which provides that the lands, which are conceded to be worth $5 and upward, shall be sold at $3 and downward—$3 for the first six months, $2.50 for four years, and the remainder at whatever they will bring; the Government to act merely as trustee for the Indians in disposing of their lands and paying over the proceeds, and not to be bound to purchase any of it except the school sections. And this is called an act "to ratify and amend" the obsolete agreement of 1901! It is to be hoped that the Senate will have a finer sense of "perfect good faith toward the Indians."

Fish Eating and Leprosy

With the beginning of Lent the newspapers have been publishing a number of articles in reference to the supposed connection between fish eating and leprosy. This is an old theory of Dr. Jonathan Hutchinson, of London, much exploited in British papers. Dr. Hutchinson, tho living in London, has had the opportunity to study many cases of leprosy, and has come to the conclusion, entirely on theoretic grounds, that the eating of fish, and especially of fish-foods that have been kept for some time yet are not well preserved, is responsible for leprosy. His theory is that the leprosy bacillus flourishes more or less luxuriantly in this kind of material, and that patients become infected through their digestive tracts or through the handling of such infected food by servants, who afterward transfer it to other food material while preparing meals for those who do not eat the tainted fish itself. The subject has proved to be of special interest of late years, because Dr. Hutchinson insists that the precept of abstinence from flesh meat imposed by the Anglican and Roman Catholic Churches on certain days of the year is really a potent cause for the spread of leprosy.

It may be said at once that Dr. Hutchinson's theory of a possible connection between fish eating and leprosy is not accepted by a single other authority on leprosy in the world. A paper on this subject written by Dr. Hutchinson was read at the International Conference on Leprosy at Berlin in the fall of 1897 and was met with disaccord by all the leprosy experts present. Dr. Hansen, of Norway, the discoverer of the bacillus of leprosy, who has more opportunities than any other to study the disease, and especially any possible connection with fish eating, said that he had tried for a long period to find any traces of lepra bacilli in fish, but failed completely. There has been no change of view in this matter since that time. At a conference on leprosy held in London last year the English medical men who have been studying the disease in India absolutely refused to give any credence to the theory of tainted fish consumption as a causative factor in leprosy. One of them brought to the conference the details of over one hundred and two cases of leprosy which he had observed in India in patients who were all rice eaters and who had never tasted fish in their lives.

Sir Patrick Manson, M. D., who is the most distinguished English authority on the diseases of the East, and who is well known as the originator of the mosquito theory of malaria, scouts the idea that fish are the cause of leprosy. He says that too many observers have been trying to find lepra bacilli in fish, either in a fresh or tainted condition, without success for there to be any truth in the theory. Dr. Hutchinson admits that the crucial test of his theory must be the finding of the bacillus of leprosy in fish, but he expresses the highest confidence that this will very soon be an accomplished fact. He has been expressing this same ardent expectation ever since the bacillus of leprosy was discovered, and time does not seem to dim the ardor of his hopes, tho there has not been the slightest encouragement for him on the part of bacteriologists who have devoted themselves to the subject unstintedly; for, needless to say, the discovery of lepra bacilli in fish would make a reputation for all time.

Dr. Hutchinson's most telling argument has been the disappearance of leprosy from England since the Reformation, as the result of the failure of the people any longer to observe the precepts with regard to abstinence which had been so universally kept before. It is a matter of history, however, that leprosy began to disappear from England nearly a century before the Reformation, and that there were very few and only scattered cases of the disease at the beginning of the sixteenth century. As a matter of fact, moreover, leprosy disappeared at the end of the fourteenth and fifteenth century from every country in Europe. At the end of the sixteenth century there were no more lepers in the southern countries of Europe which had remained faithful to the old Church and its precepts than in the northern countries, which had broken away.

Dr. Hutchinson is doing one great good by calling direct attention to the fact that leprosy is only very mildly contagious. We believe that there is not a single case on record where any one in

contact with lepers has contracted the disease except after a very long period. There are good authorities who say that at least nine or ten years of close intimacy with a leper would be necessary to bring about a development of the disease in one without any hereditary tendency. Wives have been known to live with lepers for even longer periods than this without contracting the disease. Leprosy is not, however, a result of any particular food, tho it may be a consequence of the lowered vitality produced by an insufficient quantity of food. Hence its tendency to attack especially the poorer classes of people. It is just as likely, however, to develop among those who are eaters of neither flesh nor fish as among those who live on a mixed diet. On the Island of Madagascar, where the inhabitants of the interior are at a considerable distance from the coast, no fish is ever eaten and the natives live exclusively on rice; yet leprosy is quite common, and as a rule a leper hospital is attached to each mission on the island. On the Island of Ceylon, on the other hand, fish is eaten very commonly by the inhabitants all over the island. Owing to ineffectual methods of preservation those in the interior are much more likely to have to eat tainted fish than those along the coast. Notwithstanding this fact, however, as was brought out at the recent English conference on leprosy, the disease exists only in a few scattered villages along the sea coast.

Dr. Hutchinson's theory, then, may be dismissed as unsubstantiated by any scientific observations and as disproved by all the recent investigations undertaken with the deliberate idea of determining whether fish eating had anything to do with leprosy. This will not, however, prevent the newspapers from exploiting this rather sensational theory whenever the subject may seem to be timely, as just at the present moment when Lent is beginning, or whenever there is a dearth of other news and it is deemed that the public has forgotten the previous discussions on the subject.

The Venezuelan Decision

The Hague Court has decided, and has decided against the contention of the United States, that the blockading Powers—that is, Great Britain, Germany and Italy—had preferential rights for the collection of their debts due from Venezuela. The point of the decision, which we heartily regret, is that might makes right—that is, by the use of force which had compelled Venezuela to recognize first the claims of these three Powers, they had acquired *de facto* rights in advance of other nations, and had not yielded them. The decision was unanimous and will be submitted to, but it will be likely to work damage, as the principle, thus accepted in the law of nations, will make nations be in a hurry to press their claims against weaker states with warships, to the danger of peace. Still this does not really imperil the weaker American States, whose integrity is protected by the Monroe Doctrine. The date of payment of some debts is only advanced, while that of others is delayed.

The Russian Bubble

The Russian power appears to be a huge, portentous bubble, which the courageous Japanese have pricked. Russia has an enormous army, but where is it? How can it be got together? An army that cannot be concentrated is no fit object of terror. To be sure, we have had two weeks of war, but that has been time enough to cripple and bottle the Russian fleet in the East, and the Baltic fleet and the Black Sea fleet dare not, or cannot, leave their stations, while one gunboat refuses to leave the port of Shanghai, and two larger ones have been hiding themselves in a French port of East Africa. The Japanese are masters of the China seas. And the Russian mighty land army of four million men, where has it vanished? A paltry hundred thousand men, or possibly a hundred and fifty thousand, are scattered along the Manchurian railway, or split up between Port Arthur and the Yalu River, unable anywhere to offer an equal front to the Japanese advance. Even the rumors that come from St. Petersburg are all of Russian losses, and most reasonable they are, for it is impossible for Russia to hasten along its ill-built railway—three sleepers to a rail—the needed reinforcements, or even the food and stores for those who are spread along the

front. Japan was "bluffing," they told the Czar. It is Russia that has been bluffing the deluded world. However it may be in the West, it is sure that there is nothing to fear from her in Asia, either on the Manchurian or the Indian border, if any other Power will only pluck up courage to resist her. This the New Japan has dared to do, and the black bear is utterly demoralized before the swarm of yellow hornets. It looks as if Russia would have to put off for a century, which means forever, her ambition to have four capitals, St. Petersburg, Moscow, Constantinople and Pekin.

Santo Domingo

It is not an agreeable duty to interfere with internal fights anywhere, and particularly disagreeable, altho not a bit dangerous, is it in Santo Domingo. The weakness of Santo Domingo is its strength; since to attack it seems the part of a bully. But in this case we had no option. A trading vessel, which both parties had promised to respect, was fired into by one faction, and they had to be driven away. The delicate thing about it all is that the United States would like to have possession of all the West India islands, and this is so well known that we shall be suspected of grabbing whenever we land marines to preserve the peace. No doubt our attitude will be perfectly correct, and we shall withdraw as soon as order is restored. Our Senate made a sad blunder thirty years ago when it did not take the island as it was offered to us, but we must wait for a new and peaceable opportunity. We must not be too hard on the Afro-Americans of Santo Domingo, any more than we are on the turbulent Latin American States that are just as bad. It is not blood that makes the difference, but the social environment in which they have been trained, which is a complex of many forces, educational and religious.

A Filipino Tribute

On two occasions before leaving Manila, Governor Taft took occasion definitely to proclaim again his policy of "The Philippines for the Filipinos." One was at the banquet given to him, the night before his departure, by his Filipino friends of all parties and factions. He was most precise and specific about it, however, a few days before that, when he accepted the invitation to lecture to the Union Reading Society at the Central Methodist Church as an opportunity to speak to the American colony in the Philippines before his departure. In this speech he dealt pretty plainly with the class of Americans who are represented in Manila by what he called "the young lions of the American press of Manila." Listen to how a Manila newspaper, hardly more than a year ago in opposition to American rule in the islands, speaks of this declaration of policy:

"'The Philippines for the Filipinos,' such is the consoling cry that pours from the lips of the highest governing power. Listen to it well, Filipinos, and retain it in the innermost recesses of the soul, as an imperishable remembrance of a great man, and at the same time as an oriflamme of combat, as a race-ideal, as the sacred creed of a whole people."

And in other columns of this same issue of *El Renacimiento* there is a contribution over a *nom de plume* that conceals one of Aguinaldo's former chief lieutenants, which is worth rendering into the more prosaic English if only to give some little notion of the educated Filipino's tendency to burst into hyperbolic poetry when his feelings are aroused, also as an indication that the Filipino's religion is very often a manifestation of hero-worship. It reads:

"At the altar of Truth officiated the Great Pontifex. And he said to the listening throng:

"'Every home, every native land is for its inhabitants, as every nest is for the winged pair that in it coos and in it holds its loves.'

"The throng had eyes of stupefaction, lips of fear, perchance thoughts of gloom. [The listening throng of "adventurers," that is.] Their illusions rent asunder! Their woven warp unraveled! All crushed by the catapult of the Supreme Word! And the Great Pontifex continued:

"'No! Do not forge yourselves illusions! *The Philippines are for the Filipinos.* This is my principle, this is the principle of those who sent me here. Respect it, revere it, as it is respected and revered by the Powers of the Great Home, of the Home of your own.'

"A thundering and cyclonic gust of wind, like those which precede great atmospheric cataclysms, bowed the necks of all, as the breeze the tops of the rice-fields. And again there resounded the accents of the High Priest:

"'By my mouth, the Great Home has promised to the Filipinos to put in their hands and over their heads the torch of the sun of Liberty.

This is the sacred ritual, the dogma of dogmas, the Formula of Democracy and Liberalism.'

"And, upon proclaiming the oracle, a halo of light, immaculate, extraterrestrial, like the light of elysian auroras, girdled with its diadem the brow of the Great Pontifex."

Presbyterian Reunion

The fact as to the cause of division between the Northern and the Southern Presbyterian Churches could not be more frankly stated and confessed than in the following from *The Southern Presbyterian:*

"The war was to protect the institution of slavery. Northern victories destroyed the institution. Southern Presbyterians teach their children to honor the fathers who fell in the struggle; but they also teach them that slavery was wrong. And they tell them they are glad the institution has passed away. It was this war for a cause that was lost that divided the Church and made it, not a great united body, but a divided and estranged body. Since we no longer espouse the cause, or even teach its rightfulness to our children, why should we, after forgiving and forgetting in every other capacity, still insist upon preserving the ecclesiastical division which resulted from the political strife?"

There is no possible good reason for still keeping the Northern and the Southern Church apart. None is so poor as to do reverence to the cause that separated them; why remain separate?

It is necessary for a journal like THE INDEPENDENT to use the services of literary agents to secure desired articles. At times men of distinction have no time themselves to write an article, but are willing to give material or an interview from which the literary agent prepares the articles which will bear the signature of the person who has given the interview or written material. In such cases, of course, it is the duty of the agent to make it perfectly clear that the article is to be published in this way, and not as an ordinary interview. In two late cases articles which came to us from the same trusted agent have, to our surprise, been disclaimed by the gentlemen whose names were attached to them, and who declare that they did not understand that the material obtained in response to our agent's request of them was to be used as signed articles. Our agent claims to have understood that he had authority to attach their names, but we are compelled to believe that he was mistaken. One of these gentlemen is Wilbur Wright, President of the Wright Cycle Company, Dayton, Ohio, under whose name was published the article, "Experiments of a Flying Man," in our issue of February 4th; and the other is Arthur M. Beaupré, of Aurora, Ill., to whom was assigned the article on "Conditions in Panama," in our issue of January 21st. We very much regret the errors.

Among the reasons which Bishop McQuaid gave for forbidding young women in his diocese to attend Cornell University was this:

"Coeducation for young ladies at the age of those frequenting these homes of learning is perilous, and therefore to be avoided."

Just what the peril in coeducation is the Bishop of Rochester does not indicate. It must have something to do with bringing young women and young men together. But that reminds us that the Bishop has, or at least had, not long ago, girl-waiters in his own diocesan seminary to attend to the wants of the young candidates for celibacy, providing them regular, steady feminine atmosphere at the time when they are most off their guard, at their meals. We find no fault, for these levites must grow used to women, since through all their priestly days they will have to deal with the daughters of Eve; but why not protect the waiter-girls as well as the young ladies from the perils of masculine society?

The orders of the new Pope that only the Gregorian music be used in the churches is making trouble in Rome as well as in this country. The young composer and friend of Pope Piux X who is charged with the influence which has produced the new command is obliged to have two police officers in constant attendance on him because of numerous threatening letters. Many choirs of the churches in Rome persist in the most slender obedience, but the Pope puts constant pressure upon them to accomplish his purpose. As to the part of women Paul and Pius are at one in words, only

Pius carries the rule further in act. Paul bade women "keep silence in the churches," and Pius says they must henceforth be shut out of church choirs. If high tones are wanted, let boys do the singing. It is no wonder that there is consternation in the choirs, and our archbishops are appealing for a modification of the restriction.

The Russians are surprised that American sympathy goes to the Japanese instead of to them. A leading Russian paper remarks that it will be to the disadvantage of the United States, which governs a people belonging to the yellow race in the Philippines, if Japan emerges from the present conflict with an increase of authority. It says:

"In this matter solidarity of the white race should constitute the fundamental principles, from which the United States and Great Britain could not depart without greatly prejudicing their own interests."

People who talk in that way forget their Christianity. It is not white men, as against yellow men, that claim our sympathy, but simply "good-willing men." It is all one whether they be white or yellow.

Many papers are not quite right in speaking of Union Seminary as a Presbyterian institution. It is only a few years ago that the General Assembly withdrew its indorsement and its aid to students of that seminary. It is under no sort of Presbyterian control, but solely under control of its trustees, who are all, or nearly all, Presbyterians. One of its Professors is an Episcopalian, and another a Congregationalist, and there is no reason why a Methodist or a Baptist should not be called. It is true that the Faculty subscribe to the essential and necessary articles of the Westminster Shorter Catechism, which is elastic enough, and they approve of the Presbyterian form of government, to which few can take objection.

The faithful in the United States are directed by the Pope to make contributions in support of the Catholic University at Washington. It is evident that the seven years of Dr. Conaty's service as Rector of the University, in succession to Bishop, now Archbishop, Keane, who was removed for supposed sympathy with "Americanism," has not been a financial success, as the university finds its indebtedness increased to $190,000; and Dr. Conaty has been transferred to the see of Los Angeles. "*Promoveatur ut amoveatur*" is a familiar policy.

The Church of England proposes to establish a National Council for its government, and it is a burning question whether women shall be allowed to vote for the lay representatives in the body. The majority is still against it, but a number of the less distinguished bishops, the Bishop of Kensington and the Bishop of Guilford, had the courage to defend it in a public meeting by the side of women speakers. Lord Hugh Cecil opposes it because he fears folks will say that the Church is "governed by a pack of women." But why shouldn't it be, if they are in the majority?

Secretary John Hay said some time ago that American diplomacy should be governed by the Golden Rule. Some people imply that he has forgotten that rule and is not dealing with Colombia as he would have Colombia, or Great Britain, deal with us. But is he not dealing with Panama under the Golden Rule and to its satisfaction? What shall we do when two outside parties are in conflict and we cannot please them both? Did our Government break the Golden Rule when it aided Cuba against Spain, or Panama against Colombia?

It was a mistake a few years ago that the proposed establishment of several large national forest reserves in the Western mountain region was defeated. We now give our heartiest approval to the establishment by the United States of a large forest reserve in the White Mountains of New Hampshire. This is not in the interest of that State alone. Nearly all the larger rivers of New England have their rise in these mountains. They are the greatest pleasure resort in the whole country, and their attractiveness depends on their forests.

When Admiral Uriu, the Japanese hero of Chemulpho, was in the Naval Academy at Annapolis, he was President of its Y. M. C. A.

Financial

Chase National Bank

A. Barton Hepburn has recently been elected President of the Chase National Bank of the City of New York. Mr. Hepburn was Comptroller of the Currency for three years, and was afterward an officer of the Third National Bank of this city, and was Vice-President of the National City Bank until his election as Vice-President of the Chase National Bank five years ago. He is widely known and popular among bankers in all parts of the country. The new Vice-President is Albert H. Wiggin, who has been Vice-President of the National Park Bank. Mr. Wiggin is a Director of the Bankers Trust Company. He was formerly Vice-President of the Eliot National Bank of Boston. For the last five or six years he has been Vice-President of the Park Bank of New York. The Chase National Bank has a capital of one million dollars, and a surplus and profits of more than three and three-quarter million dollars. The Directors, besides Mr. Hepburn and Mr. Wiggin, include: James J. Hill, of St. Paul, Minn.; George F. Baker, President of the First National Bank; John I. Waterbury, President of the Manhattan Trust Company; Oliver H. Payne, Grant B. Schley and Ex-President Henry W. Cannon, who becomes Chairman of the Board.

Union of Trust Companies

An agreement has been reached for a consolidation of two prominent and successful financial institutions—the New York Security and Trust Company (Charles S. Fairchild, president,) and the Continental Trust Company (Otto T. Bannard, president), whose combined assets will exceed $70,000,000. The new corporation will take the name of the first of the two. Mr. Bannard is to be the president, and it is expected that Mr. Fairchild will be chairman of the Board of Trustees. The capital will be $3,000,000, and the surplus $9,000,000. With respect to the support of financial interests the new company will have great strength, for its board will contain prominent representatives of the National City Bank, the New York Life Insurance Company, J. P. Morgan & Co., the First National Bank, and leading financial institutions of Chicago.

The New Haven Road

Control of the Central New England Railroad has passed to the New York, New Haven and Hartford Railroad Company by the purchase of a large majority of the New England company's stock. The road thus acquired extends westward from Hartford and Springfield, about 160 miles, crossing the Hudson by the Poughkeepsie Bridge (which the company controls) and is the most direct route from New England to the Pennsylvania coal fields. This important transaction, together with plans for improvements in the New Haven system, indicates the broad and progressive policy of the new President, Charles S. Mellen. Some years ago Mr. Mellen was vice-president of the company. He now returns to it from the presidency of the Northern Pacific road, having attained a commanding position in the railway world.

The annual report concerning the Mineral Resources of the United States, soon to be issued, shows that the average price of anthracite coal increased 39 per cent. in the five years ending with 1902. For bituminous coal the increase was 40 per cent.

....Speyer & Co., of this city, were successful in obtaining the contract for the new Cuban loan of $35,000,000. The bonds are to run 40 years, drawing interest at 5 per cent., and the security includes special internal taxes and 15 per cent. of the customs receipts. The contract price was 90½.

....Dividends and coupons announced:

Atch., Top. & S. F. R'way Co. (Eastern Okla. Div.), Coupons, payable March 4th.

International Paper Co. (Preferred), 1½ per cent., payable April 1st.

Rubber Goods Mfg. Co. (Preferred), 1¾ per cent., payable March 15th.

Chicago Great Western R'way (Preferred), $2.50 per share, payable February 29th.

Insurance

Tea and Life Insurance

An English life insurance company doing business under the name of the British Widows' Assurance Company, Limited, notwithstanding the fact of its having 2,000 agents in various parts of the kingdom, has lately sought to extend its field of operations. Something of its methods were recently disclosed in the Chancery Division in London. The company's plan, it appears, contemplates the securing of takers of life insurance policies issued by it, in connection with the merchandizing of the tea in which it also deals. In other words, a life insurance policy replaces the gaudily colored chromo that once obtained high favor as a gratuity that accompanied the pound of tea purchased because of or in spite of it. The English company rejects with fine scorn the superannuated chromo idea and offers 10 shillings, or $2.40, a week annuity to each and every married woman in case of the death of her husband, so long as she continues in her widowhood; always provided, however, that she shall purchase half a pound of its special brand of tea per week for thirteen weeks and continue thus to make stated weekly purchases of tea during the continuance of the life of the policy. In case the bereaved widow should chance to solace herself by remarriage within the two years following the loss of her lord and master she thereupon becomes entitled to a dowry of £50.00. This is not much, to be sure, but still it is something. A less sum is granted if her consumption of raw tea falls below half a pound weekly.

The scheme seems popular in England, but thus far to have awaited exploitation in the United States. Of course, it is "freak" insurance, but then why should the "freaks" not be exploited?

Fire Losses at Baltimore

In response to a call from the Insurance Department of the State of New York made upon all fire companies of this State for an immediate statement of their estimated Baltimore loss, reports were made from which tables giving figures have been prepared.

The following schedule gives the losses returned by some of the more important domestic companies. This schedule has been prepared by the department so as to show the paid up capital on December 31, 1903, surplus on that date and estimated net loss of the companies in the Baltimore fire:

SCHEDULE OF NEW YORK STATE FIRE INSURANCE COMPANIES.

Name of company.	(1) Paid up capital on December 31st, 1903.	(2) Net surplus on December 31st, 1903.	(3) Estimated net loss in Baltimore fire.
Agricultural	$500,000	$711,596.58	$260,000
Assurance Co. of Am.	400,000	250,821.69	100.000
Commonwealth	500,000	430,283.74	50,000
Continental	1,000,000	6,563,428.53	1,000,000
Dutchess	200,000	103,724.90	55,000
German Alliance	400,000	501,406.46	65,000
German American	1,500,000	5,633,249.59	550,000
Germania Fire	1,000,000	2,518,464.11	280,000
Glens Falls	200,000	2,475,877.09	200,000
Globe and Rutgers Fire	400,000	338,292.85	60,000
Greenwich	200,000	158,163.77	200,000
Hamilton Fire	150,000	33,839.42	100,076
Hanover Fire	1,000,000	630,227.49	350,000

Insurance Statements.

THE FIDELITY & CASUALTY COMPANY, OF NEW YORK.

The twenty-eighth annual statement of the Fidelity & Casualty Company shows total assets of $5,900,861. The capital stock of the company is $500,000, and there is a net surplus of $1,230,567, or a surplus to policy holders of $1,730,567. The company has paid losses to the end of 1903 amounting in total to $17,608,130. The President of the company is George F. Seward.

PHŒNIX INSURANCE COMPANY, OF HARTFORD, CONN.

The assets of the Phœnix Insurance Company, of Hartford, Conn., are now $6,853,661, which is an increase of $356,049 over last year. The net surplus is now $1,581,016. The semi-annual statement of this company is published in detail elsewhere in this issue. The President of the Phœnix Insurance Company is D. W. C. Skilton.

The Independent

Vol. LVI NEW YORK, THURSDAY, MARCH 3, 1904 No. 2883

Survey of the World

Panama Canal Treaty Ratified

The Hay-Varilla Panama Canal treaty was ratified in Washington on the 23d ult. by a vote of 66 to 14. If the paired Senators had voted, the final count would have been 72 to 17. All the negative votes were cast by Democrats. There was almost an even division of the Democratic party in the Senate on this question, for (with pairs included) 16 voted for ratification and 17 against it. These 17 were Senators Bailey, Bate, Blackburn, Carmack, Culberson, Daniel, Dubois, Gorman, McLaurin, Martin, Morgan, Newlands, Overman, Patterson, Pettus, Teller and Tillman. Mr. Bacon's amendment, providing for the conciliation of Colombia by arbitration or direct agreement, was rejected by a vote of 24 to 49. During the closing hours of the debate Mr. Hoar undertook to explain his speech of some weeks ago, declaring that he had been misunderstood. He had not then intended to reflect upon the President, but only to obtain full information. Mr. Foraker seemed unwilling to accept this explanation. He reminded Mr. Hoar that the Democratic opponents of the treaty, and other Senators, had regarded the speech as a sharp attack upon the President. When Mr. Hoar complained that the Senator from Ohio was misrepresenting him, Mr. Foraker read passages from the speech in question, and the galleries listened with much interest to the very earnest colloquy of the two Senators. Mr. Simmons said he did not believe that the President or members of the Cabinet had encouraged, incited, or in any way participated in the Panama revolution. There were acts of the Administration, however, which he did not approve. But he had decided to vote for the treaty.—Ratifications were formally exchanged in Washington on the 26th, and a proclamation putting the treaty into effect was issued. Thereupon Minister Bunau-Varilla cabled to President Amador his resignation. He had already asked the Panama Government to withhold from him his salary and to use it as the nucleus of a fund for the erection of a monument to Ferdinand de Lesseps. The retiring Minister's successor will probably be Pablo Arosemena, recently the President of Panama's Constitutional Convention. In Panama and Colon the ratification of the treaty was celebrated by torch-light processions and fire works. Orders were given at Washington that the Third Infantry should be sent at once to the Isthmus, to relieve the marines now on duty there. Owing, however, to a sentiment in Congress that troops should be withheld until there is need of them, these orders may be modified.

The Commission and Its Work

The President promptly proceeded to select the members of the Panama Canal Commission. It is understood that the following persons will be appointed: Rear-Admiral John G. Walker, U. S. N., retired (chairman of the Isthmian Canal Commission); Major-General George W. Davis, U. S. A., retired; Col. Frank Hecker, of Detroit, Director of Transportation during the war with Spain; William Barclay Parsons, engineer of the New York subway; William H. Burr, professor of engineering in Columbia University; C. Ewald Grunsky, civil engineer, of San Francisco, and

Benjamin M. Harrod, engineer, of New Orleans, for many years a member of the Mississippi River Commission. With respect to Mr. Harrod there was some delay, owing to charges relating to his action while serving as chief engineer of the New Orleans Drainage Commission; but the President, after careful examination, decided that Mr. Harrod's defense and explanations were sufficient. Immediately after organization the Commission will go to the Isthmus, and its headquarters will be there. Admiral Walker expresses the opinion that within eight years the canal will be open for use. When the work is well in hand, he says, from 30,000 to 40,000 men will be employed. At the beginning the Commission will undertake the sanitary improvement of Panama and Colon, giving each city a sewerage system and a water supply, and raising Colon out of the marsh. Senator Kittredge has introduced a long bill vesting the government of the canal strip in a board of three men.—The new Constitution of Panama calls the people of the republic "Panamans."—There is no reason to expect, the French Foreign Office says, that the French courts will grant any injunction that would prevent or delay a transfer of the Canal Company's property.—According to the latest reports, General Reyes has been elected President of Colombia by a majority of three votes in the Electoral College.

The Field of Politics

Mr. Hanna's successor in the Senate is Charles Dick, who has been representing the Nineteenth Ohio district in the House, and is chairman of the Republican State Committee. There was no contest. Governor Herrick declined to be a candidate. The political control of the State will remain in the hands of the late Senator's associates and supporters, whose policy is not always in accord with that of Senator Foraker.—It is understood that ex-Governor W. Murray Crane, of Massachusetts, is the President's choice for the office of chairman of the Republican National Committee. He has not been inclined, however, to take the place, and therefore others have been under consideration. Among these are Senator Scott (an intimate friend of the late Senator Hanna); Senator Penrose, J. W. Blythe, of Iowa, and Postmaster-General Payne. The vacancy caused by the resignation of Secretary Perry S. Heath has been filled temporarily by the appointment of Elmer Dover, who was Mr. Hanna's private secretary.—Mr. Dover, at the request of the family, has given to the public the following letters:

"My Dear Mr. President: You touched a tender spot, old man, when you called personally to inquire after me this morning. I may be worse before I can be better, but all the same such 'drops' of kindness are good for a fellow. Sincerely yours, M. A. Hanna."
"Friday, P. M."

These were the last words written by the Senator. He never saw the reply, which was as follows:

"Dear Senator: Indeed it is *your* letter from your sickbed which is touching—not my visit. May you very soon be with us again, old fellow, as strong in body and as vigorous in your leadership and your friendship as ever. Faithfully yours, Theodore Roosevelt."
"February 6th, 1904."

When this was received, the Senator had become so ill that letters were withheld from him.—Mr. Bryan denies that he is supporting the candidacy of Mr. Hearst, who, he says, "is among those worthy to be mentioned." In Massachusetts, George Fred Williams says, in a published letter, that he is "about to start a campaign for Hearst because" he doesn't see that "the progressive element in the Democratic party has any other candidate to whom it can tie its fortunes." Having by unanimous vote invited Mr. Hearst to address them, the members of the Mississippi Legislature by a large majority voted down a resolution extending a similar invitation to Mr. Cleveland. The Democrats of the Warren district in Ohio have elected two delegates instructed for Hearst.—Bourke Cockran has been elected to fill the vacancy in the House caused by the resignation of Mr. McClellan, now Mayor of New York, and will be a member of the Ways and Means Committee.—Mr. Bryan visited New York last week at the invitation of mutual friends of himself and Judge Parker, who desired to obtain his support for the latter's can-

didacy. The result has not been made known.—In a case involving the disfranchising suffrage clause of the Alabama constitution, that of Giles (a negro) against a Board of Registration, the Supreme Court—as heretofore in another case in which Giles was plaintiff—dismisses the appeal for want of jurisdiction. It appears that in the State courts Giles based his claim upon his rights under the State laws, thus raising no Federal question upon which the Federal courts could review the decisions of the State tribunals.

Postal Fraud Convictions

After a long trial, before Judge Pritchard in Washington, four of the men indicted in connection with the postal service frauds have been convicted. They are August W. Machen, formerly Superintendent of the Free Delivery service; George E. Lorenz, formerly postmaster at Toledo; Samuel A. Groff and Diller B. Groff. Mrs. Lorenz had been indicted with them, but she was discharged by the court two weeks ago. The Groffs (one of whom is a policeman in Washington) were the inventors and owners of a device for fastening mail boxes. This was manufactured at a cost of 20 cents, and sold to the Government for $1.25; forty per cent. of this was paid to Machen, and 20 per cent. to Lorenz, who served as a go-between. Some years ago Machen was Lorenz's assistant in the Toledo post office. Entering the service at Washington in 1893, he rose to the office of Superintendent of Free Delivery, and in this place, by granting the requests of Congressmen (especially with respect to the establishment of new rural free delivery routes) he gained political and personal influence that for a long time prevented any official investigation of his corrupt acts. Prosecuting counsel remarked at the trial that on a salary of $3,500, "by strict economy," Machen had been accumulating $20,000 a year. The court's sentence for Machen, Lorenz and Diller B. Groff is two years in the penitentiary and a fine of $10,000. The other Groff will fare better, because one of the Government's attorneys expressed the opinion, during the trial, that the evidence did not warrant his conviction. Against Machen there are a dozen more indictments.—It is asserted that the report of those who recently made an investigation of the New York post office recommends the removal of Postmaster Van Cott, on the ground of general mismanagement and incompetency.

Enlarging the Navy

During the debate in the House on the Naval Appropriation bill, which provides for the expenditure of $97,000,000, some surprise was caused by the protests of Mr. Burton, of Cleveland (chairman of the River and Harbor Committee), against the appropriations for new ships and the policy of enlargement with which these appropriations are in accord. These additions and the Government's programme of construction were, he said, a departure from our traditional policy, which had been the bulwark and honor of the republic. So great an annual appropriation meant that foreign nations were invited to attack us. They could not be deceived by the pretense that such expenditures were designed to promote peace; the aim of such a policy of construction was to make the United States an international swashbuckler. Mr. Burton urged the Democrats to be consistent and vote against the bill. The debate and votes, however, showed that they were not united. Their leader, Mr. Williams, said that a large part of the appropriation was for work on ships now in hand; these should not be left to rust at the dock. The bill—which provides for one new battle ship, two armored cruisers and three scout cruisers, with an increase of 3,000 enlisted men—was defended by Mr. Burton's Republican associates, mainly on the ground that a strong navy is the most effective insurance against war. A minority of the Democrats voted with the Republicans against Mr. Burton's motion to cut out the battle ship. The vote upon this motion and upon others made and supported by a majority of the Democrats (who sought to exclude the two cruisers and to prevent expenditure for the projected naval station near Manila) was about two to one, and the bill was passed substantially in its origlnal form. Under the leadership of Mr. Hearst (a candidate for the Presidential

nomination) the Democrats attempted by amendment to provide that the eight-hour law should be applied to all contracts for construction in private yards. The amendment was rejected by a party vote of 110 to 62.—Negotiations for treaties of arbitration have been suggested by Great Britain, France, Italy and Holland. Formal negotiations have not been undertaken by our Government, however, and will not be, unless ratification shall be clearly foreshadowed by the attitude of the Senate.

Labor Questions

Before the House Committee on the Judiciary, last week, arguments against the Anti-Injunction bill were made by counsel representing the Anti-Boycott Association and substantially all of the Employers' Associations of the country. One of these gentlemen was James M. Beck, formerly Assistant Attorney-General, who asserted that the bill would repeal the Sherman Anti-Trust law, or a large part of it, by legalizing conspiracies in restraint of trade, which are now unlawful. The bill provides that no combination or agreement to do any act in furtherance of a trade dispute shall be deemed criminal, and that those engaged in it shall not be indictable or otherwise punishable for conspiracy if such act when committed by one person would not be punishable as a crime; also that such an agreement or combination shall not be considered as in restraint of trade, and that no restraining order or injunction shall be issued with relation thereto. The representative of the Anti-Boycott Association asserted that the bill would prevent legal action against boycotts, legalize combinations of unions and employers' associations that oppress persons who are not included, and legalize such extortion as was practiced by Sam Parks.—In Chicago, Judge Holdom has issued a strike injunction against the Central Labor Union. It is said that his order affects 200,000 workmen. The same Judge has for the second time held the local union of press feeders guilty of violating an injunction. He required the union to pay a fine of $1,000, imposed fines upon its officers, and also sent the president and secretary to jail for several months.—At the first annual convention of the Citizens' Industrial Association, of which David M. Parry is president, there was established a Bureau of Information, which is to ascertain the names of "law-breakers who practice intimidation, boycotting and picketing;" also a Law and Order department, to aid local organizations in apprehending and prosecuting persons guilty of violence in labor disputes.

Cuba and Porto Rico

The treaty with Cuba concerning the Isle of Pines has lapsed by limitation, owing to the expiration of the time allowed for ratification. Final action upon this agreement was prevented, some weeks ago, by the opposition of Senator Penrose and others, representing settlers from this country, who complained that the local government of the island was inadequate, and also asserted that they had been led to expect that the island would be retained as territory of the United States. It is said that a new treaty, more satisfactory to these settlers, but acknowledging the sovereignty of Cuba, will be negotiated.—Official reports show that in the calendar year 1903 our exports to Porto Rico were $11,819,000 (against $12,194,000 in 1902), and that the island's exports to the States were $10,152,000 (against $9,634,000 in the preceding year). Trade with other countries is comparatively small—$2,119,000 of imports and $4,267,000 of exports. The island sells to us sugar (nearly $7,000,000), leaf tobacco, cigars and coffee, but by far the greater part of the coffee crop goes to Europe. Still, the quantity of coffee marketed in the States increased from 1,906,000 pounds in 1902 to 5,461,000 in 1903. The bulk of our exports to the island consists of flour, cotton goods, machinery, hardware, bacon, lard and salted pork. Agents of New York exporters who have recently returned from Porto Rico say that exports from the States have declined because the people are unable to buy. In every industry, they add, there is great need of capital.

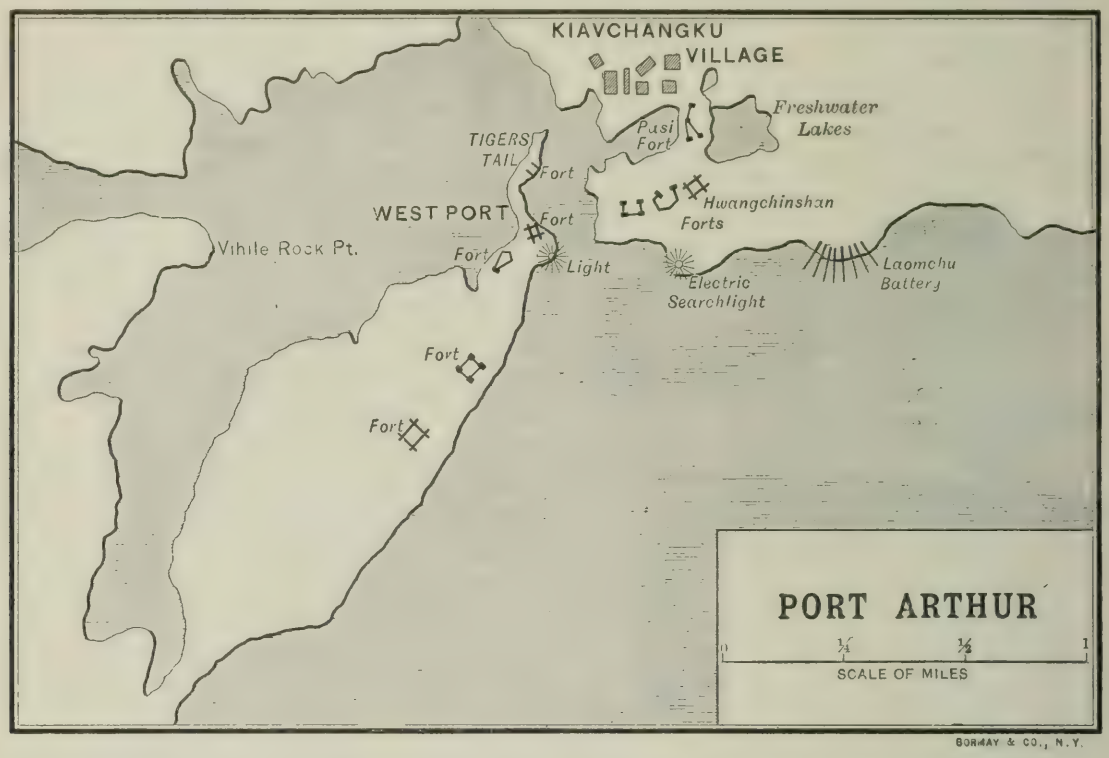
French Arbitration Treaties

An arbitration treaty has been signed between France and Spain which is similar in its provision to the arbitration treaties recently concluded

between the three Powers, Great Britain, France and Italy. This relieves the fears occasioned by the action of Spain in sending troops to the Mediterranean islands, and strengthens the confidence in the maintenance of peace in Europe.—Baron d'Estournelles de Constant, who has done so much to promote the peace movement, anounced at a meeting of the deputies favoring international arbitration that a similar arbitration treaty was being negotiated between France and the United States, and commended in the highest terms the actions of President Roosevelt doing so much for the advancement of civilization in submitting the Pious Fund case and the Venezuelan controversy to The Hague Court.

The French Friars

M. Combes, the French Premier, has so far met with no serious obstacles in carrying through his extremely radical measures against the religious orders. On February 23d the bill regulating secondary education, which prohibits any member of a religious order from teaching in a public or private school, passed the Senate by a large majority. The first test vote came on the third clause of the article, which provides that any Frenchman not less than 25 years old may open a school for secondary instruction, provided he files with the inspector (A) the papers relating to his birth and parentage, (B) a statement of his previous habitations and occupations, (C) a declaration that he does not belong to any congregation (religious order). On the motion of M. de Las Casas to amend by inserting the word "unauthorized" before "congregations," a debate took place in which the Clericals denied the right of the Government to interfere with the freedom of teaching in the private schools, and claimed that the functionaries of the state could not give a neutral and unbiased instruction and the individual had a right to education in accordance to his beliefs. M. Chaumié, the Minister of Public Instruction, declared that liberty of instruction was not unlimited, and that the proposed act was not directed against any individuals, for they could become eligible as teachers by withdrawing from the congregation, but that while they were members of a religious order they were not free to choose the methods or matter of their teaching, but were forced to obey the instruction of their ecclesiastical superiors. The amendment of M. de Las Casas was lost by a vote of 153 to 101.



France and Siam

By the treaty just concluded between Siam and France the boundary line goes still further to the west, and France gains some concessions which are capable of indefinite extension in the future. The encroachments of France on Siamese territory have been so continuous and unchecked that its absorption seems to be inevitable. By the treaty of 1893 the Mekong River was made the boundary between French and Siamese territory, and France was granted only that portion of the province of Liang Probang which lies east of that river. Ostensibly to avoid conflicts there was established a neutral zone of 25 kilometers wide to the west of the Mekong, into which Siam was not allowed to send troops. Under pretext of suppressing the disorders which arose in this unprotected strip the French intervened, and even collected taxes in Western Liang Probang. The Siamese officials who objected to this were put in chains. Now it is announced that France considers her interest paramount in the valley of the Mekong, altho in the valley of the Menam it is recognized that England has equal rights. The new treaty cedes to France the provinces of Melouprey and Bassac, and gives her all of Cambodia, including Kratt, which is capable of being made an important sea port. The whole of the kingdom of Liang Probang and the districts of Kin-Tao and Kontsavadi are acquired by France, which makes the Mekong for 500 kilometers a French river. It is stipulated that French engineers and capital shall be employed in all public works, and a railroad be built with the aid of France from Battambang to Pnom-Penh, the capital of Cambodia. In exchange for this France cedes to Siam the port of Chantaboun, which France has been occupying without any legal right and in which she claims to have expended some $2,000,000 in public im-

provements. Even to this concession there is a string attached, for the city is not to be turned over to Siam till all the other provisions of the treaty are complied with, which will necessarily take several months to accomplish and may be prolonged indefinitely. France has promised to evacuate Chantaboun several times before without results.

Port Arthur

Since almost nothing is known of the movements and positions of the land forces, public attention during the past week has been concentrated on Port Arthur, which has been the object of repeated attacks by the Japanese torpedo boats, apparently with the three objects of destroying Russian vessels, of blocking the harbor and of keeping the Russians in a state of constant excitement and alarm. Last week we gave a picture of Port Arthur, and this week we insert a map, showing the narrow, tortuous passage at the entrance which the Japanese are trying to block up by sinking vessels in it. At its widest part this channel is less than a thousand feet wide, and at the narrowest part the channel is only 130 feet wide, and at low water has only 23 feet of water at the entrance where the "Retvizan" is aground. A lighthouse is placed at the entrance and lower lights along the channels. To the west of the lighthouse, on a promontory 500 feet high, is placed a fort, and on the opposite side are three forts at altitudes of 270, 350 and 266 feet respectively, within two miles of the mouth of the harbor. These fortifications have no sheltered connections, and the variety of guns is so great as to require fifty different kinds of ammunition. The "east port" is a small basin lined with docks, but the larger "west port" is not of so much value on account of the mud flats, through which channels have to be dredged.—The most important action during the week at Port Arthur was

the attempt of the Japanese to bottle up the Russian fleet in the harbor by sinking merchant vessels in the channel. Like the attempt to shut Cervera's fleet in the harbor of Santiago by the sinking of the "Merrimac," this was a failure, for the ships were sunk too far out in the open harbor to block the channel. Five Japanese steamers selected for the purpose, "Tinshin Maru," "Bushu Maru," "Buyo Maru," "Hokoku Maru" and "Jinsen Maru" (*maru* is the Japanese word for merchant steamer), approached Port Arthur about 4 o'clock on the morning of February 24th. They showed no lights, but were discovered by the Russian searchlights, and a heavy fire opened on them by the forts and the "Retvizan," which, altho it cannot be floated, makes

an efficient shore battery. The "Tinshin" steered too far to the left and ran upon the rocks, and the "Bushu," which was damaged in her steering gear by a shot, sank near her. The "Buyo" was sunk soon after. The "Hokoku" and the "Jinsen" ran very close to the "Retvizan," one on each side, the fuel and explosives were lighted, and with loud cheers the crews got into their small boats. The "Hokoku" exploded and sank on the shore close to the lighthouse and the other vessel further out, so the channel was left open. Some of the Japanese manning the sunken vessels were killed or drowned, some boats reached the torpedo fleet waiting for them outside, but the boats containing 15 survivors of the "Jinsen" and 14 of the "Bushu," confused by the glare of the Russian searchlight, were driven east by a strong wind, and by daylight were out of sight of the Japanese fleet. In the evening they reached the Miaotao Islands, where they chartered a junk to carry them to Tungchanfu, and from there they walked to Chefoo.—Thursday the Japanese torpedo boats approached close to Port Arthur, where the "Askold," the "Boyan" and the "Novik" (which is now repaired) were outside the mouth of the harbor, having just returned from Pigeon Bay. After half an hour's fighting the Russian vessels took shelter in the inner harbor and the Japanese retired. The Russians claim to have sunk one of the Japanese torpedo boats in this engagement. At the same time the Japanese cruisers attacked two Russian torpedo boats in Golubinaja Bay. One of these escaped, but the other is reported destroyed.—A determined attack on Port Arthur is daily expected, and General Stoessel, commander of the garrison, has issued a proclamation, concluding in these words:

"Our troops know and the inhabitants are herewith informed by me that we will not yield. We must fight to the finish, as I, the commandant, will never give an order to surrender. I bring this to the notice of those less daring and call on all to become convinced of the necessity of fighting to the death. Those who leave without fighting will not save themselves. There is no way out. On three sides there is the sea, and on the fourth will be the enemy. There is no means of escape, except by fighting."

Manchuria It is reported that the Japanese have landed at Possiet Bay, about 70 miles southwest of Vladivostok, and are pushing inland toward Hunchun, some 40 miles west. If this is true it indicates an important and surprising maneuver on the part of the Japanese, for they may be able from this point to cut off and perhaps capture Vladivostok, while at the same time they could by pushing westward reach Kirin and the railroad which passes near there connecting Port Arthur with Harbin, now the Russian commercial and military headquarters. If, as generally supposed, the bulk of the Russian troops is in Southern Manchuria, near the coast between the Yalu River and the Liaotung Peninsula, it is more feasible for the Japanese to enter Manchuria north of Korea. —Viceroy Alexieff has issued a proclamation to the Chinese in Manchuria stating that the interests of China and Russia are identical, altho China "has declared her intention of looking on with her hands in her sleeves," and the Chinese farmers and merchants must continue their usual vocations and supply the Russian troops with provisions and assistance. The Chinese local officials are held responsible for any damage to the railroad or telegraph lines, and they must not harbor or conceal "the Chunchuses, the red-bearded brigands." "If the people treat with enmity the Russian army, this Government will exterminate such persons without mercy."—Some Japanese disguised as coolies attempted to blow up with dynamite the railroad bridge over the Sungari, but were detected by the Russians and hanged on the bridge. Three officers of the general staff, Colonel Assai, of the engineers, and Lieutenants Zoneloiascha and Keurta, of the sappers, were among those executed.—It is rumored that Chinese troops are collecting west of the Liao River and that there are 10,000 of them under General Ma on the road between Tung-chu and Chao-jan. If China should depart from her policy of neutrality this force on the Russian flank would be dangerous. Their object now seems to be to hold the railroad in Western Manchuria and dispossess the Russian guards now in the stations.—Vladivostok is blockaded by a Japanese fleet, probably under General Uriu, and

the four Russian cruisers now in that port can do nothing to prevent the landing of the Japanese troops and their march toward Kirin.

Korea

No fighting of importance has yet occurred on land, but there has been some skirmishing in Northern Korea between the Cossack cavalry and the Japanese outposts. The Russians report the country clear of any important Japanese forces, as far as Ping-Yang, which is about 100 miles south of the point where the Yalu River is crossed. Some 80,000 Japanese troops have passed north of Seoul, and are probably occupying Ping-Yang, or some point in the vicinity. It is not known whether the Russians will make a stand in Northern Korea, or will keep most of their force on the Manchurian side of the Yalu.—The "Variag," which was sunk in the harbor of Chemulpo by the first shots of the war, will be raised and repaired by the Japanese. The "Korietz" is too severely damaged to be made use of.—The Russian newspapers have denounced Commander Marshall, in charge of the United States gun boat "Vicksburg," for inhumanity in refusing to join the other foreign vessels in their protest against the threat of Admiral Uriu to attack the "Variag" in the harbor if she did not come out, and for not assisting the survivors after the destruction of the vessel, and an informal protest was made by the Russian Government against him. Commander Marshall telegraphs that he sent boats and medical aid to the crew of the "Variag," but it was refused. The Administration holds that in not joining with the British and French note of protest, he was acting in accordance with the traditional American policy of neutrality and avoidance of concerted action with other Powers.—A treaty has been concluded between Japan and Korea which is of such importance that we quote it in full. It gives the Japanese practically a protectorate over Korea, and Russia has protested that it is invalid, as it was obtained under duress while the country was occupied by the army of Japan:

"Article I.—For the purpose of maintaining a permanent and solid friendship between Japan and Korea, and firmly establishing it in the Far East, the Imperial Government of Korea shall place full confidence in the Government of Japan and adopt the advice of the latter in regard to the improvements in administration.

"Article II.—The Imperial Government of Japan shall in a spirit of firm friendship insure the safety and repose of the imperial house of Korea.

"Article III.—The Imperial Government of Japan definitely guarantees the independence and the territorial integrity of the Korean Empire.

"Article IV.—In case the welfare of the imperial house of Korea or the territorial integrity of Korea is endangered by aggression of a third Power or internal disturbances, the Imperial Government of Japan shall immediately take such necessary measures as the circumstances require, and in such case the Imperial Government of Korea shall give full facilities to promote action of the Imperial Japanese Government. The Imperial Government of Japan may, for the attainment of the above mentioned object, occupy, when the circumstances require it, such places as may be necessary from strategic points of view.

"Article V.—The Governments of the two countries shall not in the future, without mutual consent, conclude with a third Power such an arrangement as may be contrary to the principles of the present protocol.

"Article VI.—Details in connection with the present protocol shall be arranged as the circumstances may require between the representative of Japan and the Minister of State for Foreign Affairs of Korea."

—The Korean army is reported to have joined the Japanese. Altho the Korean soldiers number only a few thousand at the most and are undisciplined and poorly armed, still their accession will have some effect, increasing the Japanese influence in Korea. The people are said to be very friendly to the Japanese soldiers.—The Korean Minister of War, who has been working at court in the interests of Russia, has been arrested and taken on board a Japanese warship.—Korean soldiers have already come into conflict with the Russian advance guard of Cossacks, which is approaching Ping-Yang, and some of the Koreans have been killed. The officials in Northern Korea are fleeing south to come under Japanese protection. A battle is likely to take place soon near Ping-Yang between the Russian troops, which are said to number 40,000 to 60,000, and the Japanese army of probably double that strength.

La Haute Politique*

BY WILLIAM WATSON

I SAILED in fancy by a beach of gold,
  Toward a golden city like a star,
  That quivered on the morning from afar—
Turrets and domes and airy spires untold.
But when I neared the marble quays, behold,
  Offal and ordure; lurking Shames, that mar
  The hue of sunlight; Plagues that deadliest are:
And ancient Tribulations manifold.

So fair, so foul, I said, the craft of State!
  Such is the glory, such the light that clings
  About the footsteps and the deeds of kings;
And in the shadow Terror sits, and Hate;
The lazars crouch, the bravo lies in wait;
  And heaven is mocked with all unheavenly things.

LONDON, ENGLAND.

The Administration and Santo Domingo

BY FRANCIS B. LOOMIS

ASSISTANT SECRETARY OF STATE

[Secretary Loomis gives to THE INDEPENDENT the accompanying brief but very definite interview, defining the attitude of the Administration toward existing conditions in Santo Domingo and the future of that republic.—EDITOR.]

THERE is no thought or possibility of the annexation of Santo Domingo to the United States, in the minds of either of the Administration or of the representatives of Santo Domingo, now in Washington. It has not come into consideration and will not. It is simply an effort which is being made to arrive at some plan which shall safeguard all interests, and put a stop to the outrageous state of affairs now existing in those islands.

It seems probable that some such treaty as now exists with Cuba, bringing it under the Platt Amendment, or some friendly protection, may have the desired effect. Obviously the time has come when something must be done to quiet the disturbing elements in a way that shall render it possible for Santo Domingo to return to the industries which are, at present, utterly neglected and turn the energy, which is now so much worse than thrown away, into productive fields.

The debt of Santo Domingo is about $25,000,000, chiefly to other countries than the United States; and the present state of affairs cannot last much longer without attracting foreign attention in a way somewhat similar to the Venezuela affair; only that there are conditions here which would render the position of the United States much more difficult than before were such a contingency to occur. The effort at present is to arrive at some solution of the difficulty which will avoid any such demonstration, but it does not include the annexation of Santo Domingo.

Santo Domingo, the "Isle of Unrest"

BY WILLIAM THORP

[Mr. Thorp is an Englishman who has only recently come to the United States. For the past five years he resided and traveled all over the West Indies, where, as editor of *The Daily Gleaner*, of Kingston, Jamaica, he had exceptional facilities to gather information. He has visited both Haiti and Santo Domingo and traveled extensively in both countries, and in addition to this while in Jamaica he became acquainted with many distinguished Dominican and Haitian refugees, who afterward were able to procure for him hospitality when he visited the island republics.—EDITOR.]

A FRIEND of mine visited Behanzin, the deposed King of Dahomey, in his exile at Fort-de-France, Martinique. They discussed, among other things, the capacity of the race to which Behanzin belongs.

"The white is a race," said Behanzin, "and the black is a race. Each is good. But the mulatto—pah! he is *café au lait*, neither good milk nor good coffee."

The judgment was, of course, prejudiced; but it gives one a good idea of the intense hatred and contempt which the average negro cherishes for the brown man. It is hardly necessary to say that the latter heartily reciprocates those sentiments.

Blacks and whites generally get along together pretty well in the tropics, and especially in the West Indies. It is the mulatto who causes trouble. The black seldom hates the white unless his prejudices are played upon and his passions aroused, but the half-caste nurses an abiding, deep-rooted anger against that superior race which is responsible for his invidious position in the world.

Here is a key to the trouble which has arisen between the United States and the mulatto republic of Santo Domingo. The killing of the naval machinist Johnson and the violation of an American consulate simply cap the climax of a long roll of serious offenses against white residents who owe allegiance to the United States or to European Powers. Persons who have lived or traveled in Santo Domingo would, at any time during the past few years, have heard without surprise of a general massacre of the whites in that country. In view of the character and prejudices of the Dominicans, it is astonishing that no such massacre has occurred. It is safe to say that it has only been averted by the constant patrolling of United States and European warships between the principal ports.

White people are disliked both in Haiti and Santo Domingo, but the dislike is bitterer and more active in Santo Domingo—the republic of the mulattoes—than it is in Haiti—the republic of the negroes; and this despite the fact that, in theory, the larger measure of privileges is accorded to foreigners in the former country.

This antipathy is responsible for three-fourths of the offenses against Americans and Europeans, ignorance of the duty of a Government professedly civilized being responsible for the remainder. Whenever money and supplies are needed by the insurgents or the Administration of the hour, the first impulse is to plunder the foreigners. If there is a white man within reach, his store is looted, or his mules taken, or his safe forced to disgorge a "loan." The natives are only plundered when the whites have been squeezed so far as their resources, or the prudence of the "expropriators"—as I once heard a Dominican politician call them—will permit.

Even in time of peace there is no justice for the white man in Santo Domingo, except under strong pressure applied by his Government. I remember an instructive case in point which came under my notice a few years ago. An English merchant caught a thieving clerk red-handed and, being new to the country, prosecuted him. The evidence was conclusive, his guilt as clear as daylight. But his lawyer sat smiling while witness after witness proved the case, and did not trouble to ask a single question in cross-examination. When the prosecution closed he turned to the mulatto judge and said:

"Surely you don't mean to give this white man the verdict at the expense of one of your own color."

That was all the defense. The crowded court rang with applause, and the judge promptly discharged the prisoner. He well knew that if he did not do so he would stand an excellent chance of assassination and a certainty of removal from office. This condition of affairs is so well understood that, both in Haiti and in Santo Domingo, white men will endure almost anything rather than seek redress at law. As a rule, they bribe the Chief of Police and other officials to afford them the protection which they need.

There is a curious illustration of this common dislike of the whites in the cathedrals and churches of Santo Domingo and Haiti. The Savior, the Virgin Mary and the Saints are almost always represented in pictures and statuary as negroes or mulattoes. The people refuse to believe that personages worthy of worship or veneration could have been white. There was a long struggle on the point in Haiti between the Church and the people, but the Church had to capitulate. Otherwise, there would have been no congregations. Dominicans and Haitians alike profess the Roman Catholic faith and support regularly organized branches of the Roman Church, with cathedrals, archbishops, bishops and priests. But the stipends of the clergy barely afford them subsistence, and they subsist, as the late Mr. James Anthony Froude truthfully remarked, "not as objects of reverence at all, but as the humble servants and ministers of black society."

Underneath the thin veneer of Catholicism the mass of the people are attached to the *vaudoux* superstitions, which were brought over from West Africa by their ancestors in the slave ships. The priest and priestess of the *vaudoux* cult are the uncrowned monarchs of Hispaniola. Everybody and everything are theirs to command. Even the President and the high officers of the Government secretly defer to them, while telling foreign visitors that all the talk about "voodooism" and human sacrifices is absurd. At least one ruler of Haiti, the "Emperor" Soulouque, was an acknowledged "papaloi," or *vaudoux* priest; while Heureaux, the

Rising Citizens of Santo Domingo

strongest President of Santo Domingo in modern times, was strongly suspected of being one.

To my knowledge, one newspaper in Port-au-Prince and two in Santo Domingo City were suppressed within recent years, and their editors exiled or imprisoned, for no other reason than that they had published accounts of human sacrifices, accompanied by cannibalism, in connection with *vaudoux* rites. During the rule of two or three of the better Presidents, notably Geffrard, there were brief crusades against the superstition. Some of the "papaloi" and "mamaloi"—the priests and priestesses—were arrested and executed for murdering children in their horrid rites. Cannibalism was clearly proved in those cases, and the records of the trials are still accessible in the British Consulate-General at Port-au-Prince. What was the result? Geffrard's daughter, Cora, was shot while she knelt at the altar of a church in the capital, and he was afterward driven into exile, barely escaping with his life. Since then Haitian Presidents have left the *vaudoux* cult alone.

In Santo Domingo the authorities have never even tried to extirpate it, and the rites are practiced with less secrecy than in Haiti. Official energies have been directed solely to trying to keep the facts from the knowledge of the outside world.

Vaudoux is a form of the snake worship so common among the lower races of mankind, and is closely allied to West African fetish, from which it is derived. In the more common rites it calls for the sacrifice of a white cock—the "senseh bird," as it is termed by "obeah men" in Jamaica—or a goat. But at the grand festivals the snake-god demands the immolation of the "goat without horns"—a child or a young girl. There are only three of these festivals during the year, at the end of January and at the end of the seasonal rains, which usually occur in May and October. But other sacrifices are offered when the island is visited by such calamities as droughts and hurricanes.

The child destined for the sacrifice is sometimes abducted, after being rendered helpless by the administration of drugs or by hypnotism, in which the *vaudoux* priests and priestesses are adepts. But there is an even more horrible method. I have been assured by many persons of responsible position and unimpeachable integrity, by missionaries, consuls and foreign merchants, that there exists in both Haiti and Santo Domingo a powerful secret society of men and women affiliated with *vaudoux*. The members of this society administer to children narcotic drugs, obtained in the jungle, which throw them into a cataleptic state indistinguishable from death. Doctors have assured me that these human fiends are acquainted with vegetable drugs and narcotics which are unknown to science and cannot be detected by any of the ordinary tests. In due course the child is pronounced to be dead, and is buried. At the first convenient opportunity emissaries of the society dig up the coffin, resuscitate the child, and sacrifice it at the next orgy of the cult. The meetings are usually held in a lonely grove of cocoanut palms or bamboos. Scores of men and women are present, and they speedily work themselves up into a state of frenzy by wild dancing and singing. The scenes that take place, as they have been described to me by men who professed to have witnessed them, cannot be related here. The worst passions of the negro and mulatto, never disciplined by our civilization, have free scope. The child's throat is cut by a keen-edged *machete,* and cannibalism crowns the sacrifice.

I could give details of a number of authentic cases of murder and cannibalism arising from *vaudoux,* if it seemed desirable to do so. I have carefully preserved the records of these cases, which were gathered during five years in the West Indies and are mostly supported by official authority. But enough has been said on this unpleasant subject to indicate the worthlessness of the Dominicans' claim to be treated as a civilized nation.

The colored people in Santo Domingo cannot fairly be compared with those in the Southern States. They are of an infinitely lower, more truculent, more degraded type. Their condition is chaotic, savage, brutal in every respect. The peasantry in the interior, tho decidedly more amiable and hospitable than the dwellers in the towns, have sunk to a lower level than the West African tribes from which they sprang, for they have

lost the highly developed, albeit barbarian, social order of those tribes, and have gained nothing from civilization except its vices. The gulf which separates them from their colored brethren in other parts of the West Indies is strikingly illustrated by the fact that the negroes in Jamaica subscribe large sums to send missionaries to them.

The country folk are fairly honest, except that they regard growing crops as being anybody's property—a sentiment which costs the planter dear—but there is a great deal of crime in the towns. Burglary and shoplifting are common offenses, and the "strong arm man," like the poor, is always with one. In most of the towns of both republics, however, the constable is more dreaded than the thief. His pay only amounts to a few cents a day, even if he gets it, and he preys upon the community more remorselessly than the criminals whom he is set to catch. He is paid a small sum for each arrest he makes. Of course, he hales men to jail on the slightest pretext; but he will let them go if they will pay for their liberty a trifle more than the official fee for their incarceration. If the prisoner cannot or will not part with the money he is brutally clubbed with a cocomacacque stick all the way to the jail, and I have known of several cases in which he arrived there dying or dead.

On every hand the traveler in Santo Domingo sees signs of degéneration and decay. The country had a good start under the Spaniards, like Haiti under the French. They laid out some fine towns, with many large and handsome buildings; they constructed excellent roads and established hundreds of coffee and sugar plantations, with "great houses" as splendid as the *chateaux* of old Spain. The mountains and savannahs teemed with countless herds of cattle, and prosperity smiled over all the land. Now, the traveler often comes across a fine old *chateau* lying in ruins in the midst of the "bush," with two or three bamboo huts around it. A few mulattoes, savages to all intents and purposes, live in these huts and subsist by growing scanty crops of yams and plantains and by killing the cattle, which now run wild. Here and there one meets a peasant who is energetic enough to gather the coffee berries, which now grow wild in the jungle that has swept over the abandoned plantations of the old Spaniards. The Haitian coffee, so well known in the market, is almost entirely collected from these wild trees; there is hardly any cultivation. Foreigners have tried it in both republics, but the dishonest exactions of the Government and the frequent revolutions have ruined them in many cases. Large investments of American capital have been made in Santo Domingo in recent years, but just as they were beginning to show fair returns the present epidemic of revolutions broke out and swept pretty nearly everything away.

From a moral standpoint the Dominicans are almost hopeless. The sacrament of marriage is seldom resorted to; when it is, the young people have usually lived together openly beforehand, without any loss of social prestige or their friends' respect. "Do you think I would marry a woman without knowing first that she would satisfy me?" said a very prominent Dominican, in reply to the protest made by a missionary friend of mine who was called upon to celebrate one of these belated marriages. The same missionary married an old couple who had been living together for nearly fifty years, and the bride brought along her six daughters to act as bridesmaids.

The civil wars which curse the country are waged with a brutality hardly credible to people who do not know the Dominicans. Men, women, and even little children are constantly murdered in cold blood—and horribly tortured when they are suspected of being able to give information about the enemy. In this matter the cultured Dominican, who has been educated in America, France or Spain, is every bit as bad as the most brutish peasant.

I remember a famous general, a man received by foreign governments as a diplomat, once telling me how he treated a band of revolutionists after they had defended a town for several months and capitulated owing to starvation.

"I suppose you gave them the honors of war, general," I said.

"The honors of war! They were rebels, and they had given me much trouble!"

"Well, what did you do?"

"We flogged them with cocomacacque sticks until they could not stand, and then we propped them up in chairs and shot

A Santo Domingo Planter and His Wife in the Midst of Their Growing Cane, with Their Supervisor and Full-Blooded Negro Work People About Them.

them to death slowly. That is how we treat rebels in this country."

Haitians and Dominicans do not love one another, and are frequently on the point of war; but I have been repeatedly told by both of them that they would unite as one man to repel a foreign invasion of either country. And such an invasion would probably prove to be no light task. The armies of the two republics are practically worthless as armies, but the people are fiercely independent, and, as a consequence of the perennial revolutions, there are great stores of rifles, cartridges and war material in the country. Once the people were aroused they would carry on a harassing guerrilla warfare that might be as tedious and troublesome as the Philippine campaigns. Prominent Dominicans have told me that, in the event of a powerful invading force landing, they would burn the towns, lay waste the crops on the plains, poison the streams and the cattle, and retire to the jungles and mountains, from which they would harass the enemy. There is no doubt that this would really be their plan of campaign.

As the United States Government seems to have no intention of conquering or annexing the country, it would be advisable to confine military operations to the ports and points in touch with the sea coast. Otherwise, the matter may become far more serious than the Administration contemplates or cares for. But it is conceivable to those who, like myself, are well acquainted with the Dominicans that, once embarked in the enterprise, the Administration will be carried by force of circumstances beyond its original intention.

The wonder is, not that intervention has been found necessary, but that it has been so long deferred. The delay is a testimony to the extreme conservatism which rules American foreign policy, especially in regard to Latin American countries. Everybody familiar with the conditions has been expecting armed intervention for years past. As long ago as 1886, Mr. Froude expressed the common opinion of white travelers in Hispaniola when he wrote:

"The present order of things cannot last in an island so close under the American shores.

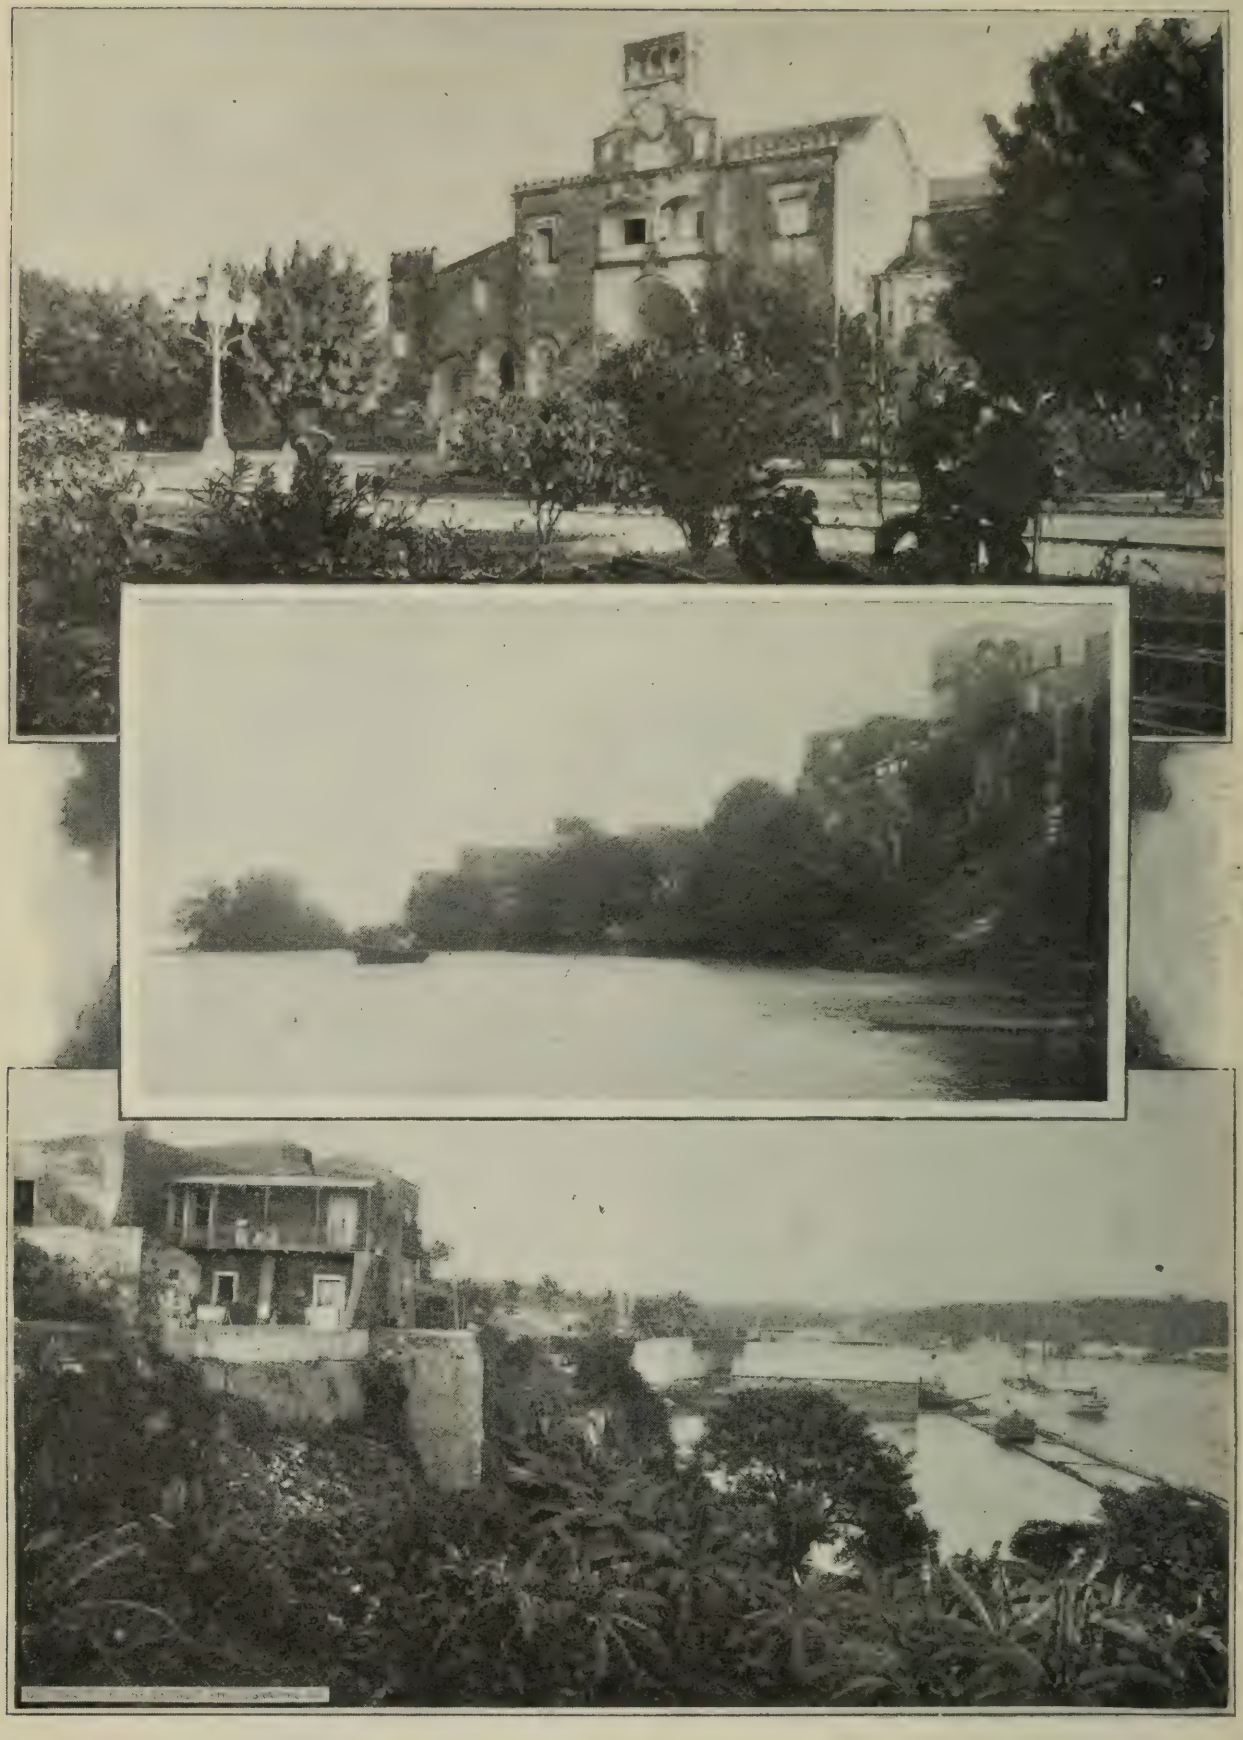
If the Americans forbid any other Power to interfere, they will have to interfere themselves. If they find Mormonism an intolerable blot on their escutcheon, they will have to put a stop in some way or other to cannibalism and devil worship."

NEW YORK CITY.

The Future of Santo Domingo

BY GENERAL JUAN FRANCISCO SANCHEZ

[At the request of THE INDEPENDENT, Gen. Juan Francisco Sanchez, the Santo Domingo Minister of Foreign Affairs, who is now in Washington, arranging for more effective diplomatic relations with the United States, but is not thoroughly conversant with English, instructed his secretary to prepare the following paper. General Sanchez is the son of Gen. Francisco del Rosario Sanchez, the earnest and patriotic leader who was executed by the Spanish for opposing the annexation of Santo Domingo to Spain. His son, who presents the following article, is no less eager to retain the independence of the little Republic of Santo Domingo, and is sent to Washington by the established Government in the hope of accomplishing some plan insuring this end.—EDITOR.]



JUAN FRANCISCO SANCHEZ

A FEW words of the history of Santo Domingo will no doubt dispel certain misconceptions regarding its population, its present condition and the aspirations of the honest thinking people there.

Francisco del Rosario Sanchez (father of Gen. Juan Francisco Sanchez, at present in Washington), Pallo Duarte, and Ramon Mella started a movement in 1844, which brought about the independence of the Spanish part of the island from Haiti. A succession of revolutions of more or less importance led to the country being annexed in 1861 by Spain under Santana; Sanchez, at the head of a handful of patriots, opposed the annexation, and rose in arms; and he and others were caught by the Spanish forces and shot without mercy. The restoration of the Republic followed in 1865; but ever since, excepting during the iron rule of Ulises Heureaux, the country has been the theater of the most unexplainable misgovernments, reaching a climax to-day difficult to define and still more difficult to combat.

Thus we reach the point when, in 1903, Gen. Alezandro Wos y Gil took the reins under a Constitutional Government, which lasted but a few months. This Government succeeded the Provisional one of Horacio Vasques, during whose honest rule the Minister of the United States, Hon. F. W. Powell, concluded, with the co-operation of Gen. Juan Francisco Sanchez, then Minister of Foreign Affairs, four very important adjustments, which had been pending as claims of the United States Government.

Something which seemed fair was proposed by dissenting parties—viz., to unite in order to bring about a free and unbiased election for the President, it being alleged that General Gil had usurped his power. For faithful compliance with this

The Cathedral (Begun 1512) and Plaza, Domingo City, Santo Domingo, W. I.

River Harbor from City Wall, Domingo City, Santo Domingo, W. I.

agreement, Morales, in whose favor Gil had abdicated on the 24th of November, 1903, issued a decree for an election immediately in December, in accord with stipulations of the act of Capitulation, but Mr. Juan Isidro Jimenes, one of the parties to the convenant, preferred to raise the flag of rebellion, proclaiming himself President and waging a desperate fight, with the aid of his partisans, and he continues to do so, notwithstanding the fact that the American Government has recognized the Morales Government.

Certain acts perpetrated by the insurgents, such as incendiarism, pillage, tearing up the rails of an American railroad at Navarrete and, last and most deplorable, the firing upon the United States launch of the "Yankee," killing the young engineer, Johnson, are of such character that every honest Dominican repudiates them, laments them earnestly and desires to find the remedy by reestablishing order and good administration, so that a system of paying the enormous foreign and interior debt may be devised, that a guarantee of life and property may be offered to every one who owns property there at present, or, attracted by the enormous resources of that immensely rich country, may become owners in the future.

Dominicans were justly proud of the fact that no one, whether native or foreigner, had ever been robbed of money, either on the road or at his residence. Many foreigners can bear testimony of this fact. Traveling has been perfectly safe under all circumstances. But now, unless something is done to bring back to a good path this beautiful country, there is no foretelling how all this will end.

No doubt the Morales Government is desirous of realizing in Santo Domingo everything that might lead to a fair and honest arrangement with all its creditors and otherwise open the country to capital. If his Government find, on the part of the United States Government, some sort of assistance, much can be expected from the men who form his cabinet.

Santo Domingo Insurgents Organizing Themselves Into an Army

From all points of view it becomes a necessity for Santo Domingo, and possibly a convenience for both countries, to have a fair and liberal understanding.

Santo Domingo's position has become to-day, in view of Porto Rico's advantages and of Cuba's singular relations with the United States, a very difficult one. Sugar constitutes the principal

produce of the South. Sugar estates are owned mostly by American citizens; it is American capital that is invested there and that continues to supply their wants. Is it possible to allow these to perish, when, with a little assistance from the American Government, Santo Domingo would be able to hold her own in this and other respects?

Cacao, tobacco, coffee and woods of all descriptions, minerals of various sorts, would find an easy and advantageous market in the vast consumption of eighty millions of people.

The geographical situation of the island and, especially, that part which constitutes the Dominican Republic, offers, as it were, surely the stronghold to protect and command the Moria passage and the control of the Caribbean Sea, which undoubtedly will play henceforth a most important part in the administration of the great and universally beneficial opening of the Panama Canal.

To every Dominican, it may be asserted without fear of doubt, the idea of annexation is repulsive and every man would oppose any such attempt with decided energy. Now, it must be borne in mind that the Spanish race, with all its characteristics, has left behind in that country a germ of patriotic pride, mixed with insubordination and lack of discipline, which makes them a difficult people to dominate, altho, as a whole, treated fairly and equitably, the masses are easily guided to proper courses.

The well thinking people to-day know that a good deal is to be expected from the assistance of the United States Government, and acts conducive to such an end would meet the approval of the great majority, even tho men of the insurgent party, while convinced of this truth, may, for their individual purposes, assert the contrary.

No one conversant with Dominican affairs can fail to see a heavy cloud forming and threatening to burst in the near future. European bondholders, Belgian, French, German, Italian and Spanish, not to mention English, as their interests are in the hands of the United States Government, will get tired waiting;

A Santo Domingo Market and a Funeral Procession

their patience will be exhausted, to no purpose. Twenty-five million dollars cannot be paid with mere promises, and they may combine upon some action with regard to the Dominican Republic which may call upon the American Government to interfere, not only to be consistent with the Monroe Doctrine, but to obviate the slightest chance of any ambitious Power securing a hold upon such points as would constitute embarrassing conditions of the highest order to the American nation.

WASHINGTON, D. C.

Imports and Exports on the Beach.—The Usual Mode of Unloading and Shipping Freights

Life in a Negro Republic

BY THE REV. T. G. STEWARD, D.D.

CHAPLAIN IN THE UNITED STATES ARMY.

PORT-AU-PRINCE, Hayti, is the largest and most important city in the world ruled politically and socially by civilized negroes. It is one of the oldest cities on this side of the water, and is laid out upon an excellent plan, with broad streets and regular squares. It has been so often swept by fires and shaken by earthquakes that few old buildings remain, altho the city wears an ancient and rather dilapidated appearance. This is owing to the facts that the buildings are mostly of wood, and the climate is very severe upon paint. Indeed, many buildings and fences are left entirely unpainted, and under the fierce rays of the sun and drenching rains, these soon turn dark in color, and present a worn and faded appearance suggestive of age and decay.

The buildings, both private and public, display but little architectural taste, being constructed more for shelter than for either elegance or convenience. In the days of Toussaint, the cities of Hayti were ornamented with large and magnificent private residences, often of white marble, built by the famous negro generals of the Revolution. The house of General Maurepas, at Cape Hayti, was described by General Debell, of the French Army, as both costly and elegant, and would have been beautiful even in Paris. General Maurepas, a negro, was declared by this general, who at one time served under him, to be a man of very wide reading, elegant in manners and general breeding, and thoroughly accomplished in the military art. Many fine scholars are still to be found in Hayti, as the present Doctor Janvier, Minister to the Court of St. James, and the Hon. Antrim Firmin, diplomat, statesman, scientist, author, and now revolutionary candidate for the Presidency, with scores of other professional and business men; but the taste for elegant homes seems to have greatly declined.

The love of dress and personal ornamentation has, however, not diminished, but has become more in harmony with the general requirements of modern fashion, affording often a most striking contrast between the people as they are decorated for the street, the ball, or the party, and the homes from which they come. The well to do people of Port-au-Prince are distinguished among all the West Indians for their fondness of elegant and costly dress, and for the extravagant way in which they wear, and even ruin, their good clothes. On arriving in the harbor by steamer, the lady passengers belonging to Port-au-Prince who have been abroad will order their trunks, and will dress themselves in their most elegant suits to go ashore, and in these beautiful and costly dresses will descend the ship's ladder to enter small boats to be rowed to the landing, as the ship cannot approach the wharf, thus running the gantlet of salt water splashes, mud and dirt; and when landed, with trains sweeping, they will depart for homes which appear to Northern eyes altogether incongruous.

The general style of dwelling may be described thus: A large, square structure, two stories high, with roof coming to a point over its center and chimneyless. The windows are without sash or glass, and have blinds within and heavy shutters outside. The second story of the house is surrounded in part, or wholly, by a balcony, which is covered by the house roof, and supported by strong posts running up from the ground. On the street sides these posts go up from the curb, and the veranda, or *gallerie,* as it is called, extends completely over the sidewalk. The balcony is, perhaps, the most used part of the house during daylight.

The manner of house is decidedly French. There is little of that neatness and order that characterizes the English or the New England home. There is more resemblance to what may be seen in Charleston, or in New Orleans. The ordinary Port-au-Prince day in a representative household would be about as follows: Between five and six, or even earlier, the family arise, and are immediately served, each with a cup of the best coffee in the world—about two tablespoonfuls or little more—with a cracker or piece of baker's bread and butter. I never saw any homemade bread in Port-au-Prince. Between eight and nine o'clock breakfast is served, consisting probably of boiled, or fried, bananas or sweet potatoes, codfish and rice, bread and butter, perhaps cocoa, tho generally with no drink but water. Between two and three comes the dinner, beginning with soup—always good—followed by roast beef, mutton or pork, with sweet potatoes, bananas, beans and rice boiled together, highly seasoned with pork and red pepper; cabbage boiled and chopped; watercresses, tomatoes, raw or cooked; desserts, banana pudding, or raw fruit; coffee or tea. At six o'clock there is a light tea of bread and butter with guava jelly, or banana sauce. Between eight and nine, frequently, there is another repast of bread and butter, with fish bought ready cooked from women on the street. The fruits of Hayti are abundant and delicious, and the flowers fragrant and rich, so that it is always an easy matter to dress up a table with effect.

The social classes exist in Port-au-Prince in as sharply defined a manner as

elsewhere; more so than is generally the case in the United States. Here may be found ladies as helpless, as fastidious and as unreasonable as can be found anywhere in the world; ladies to whom work is the one thing degrading, but all are not such. Many of the most beautiful and accomplished lead very useful lives. Many of the young ladies make their own dresses, trim their own hats, knit, crochet and embroider, altho avoiding everything like plain work. The working people are entirely distinct from the wealthy and professional people. They are spoken of as belonging to another order of creation. They are a warm-hearted, kindly disposed people, ruled over by the more powerful and more fortunate. They support the country, but get very little of its advantages. The social relations of the classes are entirely incompatible with republican sentiments. The same pernicious principles prevail in politics; and Hayti is much more of a military oligarchy than a true republic. The aristocratic classes dispute and war among themselves, and drag the poor laborer from the fields and wharves into the horrors of bloody strife.

The army is always large—very large in proportion to the male population; poorly housed and poorly paid and fed. Consequently it is ever a ready instrument in the hands of any powerful political chieftain who may be able to pay and feed the soldiers. War is plenty; peace is starvation. All young men, unless specially exempt, are compelled to serve for a period; and, hence, the Haytians are a nation of soldiers and ever ready to fight.

One of the most interesting sights to be seen near Port-au-Prince is the women engaged in laundry work in the neighboring streams. The washerwomen bare themselves even beyond the license of party fashion, and soap and lave the clothes, drying and bleaching them upon the grass until a snowy whiteness is secured, chattering and laughing meanwhile as tho their work were a semi-picnic. I doubt if there is a clothes line or a clothes pin in Port-au-Prince among the real Haytians. Washboards are seldom used. Recently, however, an enterprising citizen from Jamaica has set up a steam laundry in the city and is rapidly picking up custom, and his industry bids fair to seriously interfere with the ancient system of river washing.

The cooking is done on little charcoal furnaces, and in brick ovens—always outdoors. Altho there are few conveniences, yet the cooks manage to prepare excellent meals, combining both African and French skill in their art. One need not starve in Hayti. The markets are well stocked with meats, fish, fruits and vegetables, and the prices not exorbitant.

Port-au-Prince, despite its conservatism and its exposure to earthquakes, hurricanes and fires, and its liability to the destructions occasioned by revolutions, and its out of the way situation, has, nevertheless, caught at least some of the spray from the great tidal wave of scientific advancement. It has its telegraphs, telephones, electric lights and tramways; and the little nation struggles hard to hold a place among progressive peoples. In all its disasters its people never expect outside help, and the good Christian nations of the earth never disappoint them. Port-au-Prince lately witnessed such a scene of national humiliation as seldom falls to the lot of any people, and this was followed by a fire causing over a million dollars damage. But no appeal for relief came from our little neighbor. Educated by the prejudices of white mankind, they know no other lesson than, "Try, try again." The President, in concluding his patriotic proclamation after the German infliction, said:

> "Let us try to draw profit from our sad experiences. Let us not forget that it is union that gives strength; that internal peace is essential to the progress of the country; and let us apply all the ardor of our patriotism to reorganize and reconstruct our country, and to endow her with prosperity and power."

Whatever may be the faults of our Haytian neighbors, dependence upon the charities of mankind is certainly not one of them.

Fort Missoula, Mont.

The March Hare's Madness

By BLISS CARMAN

Author of "Songs from Vagabondia," Etc.

PERHAPS one of the maddest things in a mad world is to inquire the cause of madness, just as it seems to be one of the requisites of happiness that we should not set our heart upon it. The Angel of Life is evasive, reticent, not to be cornered, yet abounding in generous revelations of the truth upon occasion; and that mortal is likely to learn most about the mysteries of being who does not pry into them too industriously. Curiosity is the fundamental passion of the mind, and to satisfy curiosity with knowledge is one of the three great sources of happiness. At the same time it is forbidden to know everything. At least this is so for the time being, whatever may be permitted to human investigation in some future age.

And so, whether it is hatters or March hares, we know very little about the madness of either. Each has become a byword in proverbial speech, and we make a simile of his erratic fortune without a second thought. How sad to be a name and nothing more in the mouth of one's fellows! Yet I have no doubt the hatter is as indifferent to his repute as the hare, even perhaps a little proud of his peculiarity. So frail is moral nature, it is boastful even of its blemishes when they lend it a little distinction and draw the eye of the crowd. One can very well fancy the complacency of the hatter under his visitation, how he would turn it to good account and make a profitable investment of his affliction. He would be a sorry tradesman who could not manage to secure some slight advantage in dealing with destiny and come out at last on the right side of his account with Providence. Was ever the madness of a hatter so complete his commercial instinct could not prevail against it? Is there not always a residuum of sanity at the bottom of his mania, a trace of shrewd calculation concealed under the guise of his feckless innocence? The madness of the hatter is the wisdom of the serpent, seemingly guileless yet profoundly subtle and sardonic.

Now the March hare is in a very different case. His folly is the folly of a child, his madness the madness of ecstasy, of elation, of transport. He is a visionary and partakes of the rapture of lovers and prophets and bards. He is possessed and carried out of himself. He is akin to the oracular priestess of Delphi and the Vestals, whose care it was to cherish the sacred flame of their goddess. He may be the least of all the creatures who suffer this form of madness, but his tenure of the divine possession is none the less authentic. The burden of joy laid upon his spirit is excessive, and an unhinging of his balance has supervened. He is mad because he loves too greatly, whereas the hatter is mad because he knows too much. Saul and Hamlet were mad as hatters, through an excess of knowledge vouchsafed to them. Blake and Shelley and many another mystic were mad as March hares, by reason of the too great stress of inspiration laid upon them. In the one case the dementia is a malady of the mind, in the other it is an affection of the spirit; tho, tried by the standard of sober sense, they are all mad together.

With something of the March hare's own folly I spent a day in a library trying to find out the meaning of his madness, its cause and scope, or how it came into our proverbial lore. Of course, the search was futile, and I only found out several things I was not looking for. One quotation, however, seemed pleasant enough to remember. Drayton in his "Nymphidia" says that Oberon

> "Grew mad as any hare,
> When he had sought each place with care,
> And found the queen was missing."

I dare say that is the gist of the matter, for the best of the cyclopedists took refuge in the bare statement that hares are particularly wild during the mating sea-

son in March. So the madness of our little brother with the long ears is only the erratic behavior of a lover, after all, and we must sympathize with him in his happy derangement. Who will say there is any joy in the world comparable to that irresponsible state of election, when the kind gods have marked us for their own, and bestowed on us the favor of their rapturous life for one spring day? Is it any wonder the hare should be full of quirks and starts, of aimless chasing to and fro, of dashing here and halting there without rime or reason? Could one expect so frail and sensitive a being to support so great a burden of ecstasy and still be undistracted, poised and sane? Is it not rather a marvel he has a spark of reason left? Most men and women have been lovers too in their day, and unless memory can be wholly blighted by time, should know how to feel for their little friend in his March wildness:

> "For that is the madness of Ishtar,
> Which comes upon earth in spring."

It is easy to identify Easter, the ancient goddess of the spring wind and the southwest rain, with Ishtar or Astarte, the deity of love who was worshiped with dark rites in Asia, passed into the purer religion of Hellas as Aphrodite, and survives as April, the mother of the new-plowed field and swelling seed. The soft wind from the south is her immortal breath; her garment is the mist of purple rain; the opening windflower and bloodroot and hepatica betray where her foot has passed; she touches the wild-cherry with her hand as she journeys and the woodlands are filled with the fragrance of its breaking bloom. In the bitter North, when the rivers are loosened from their long imprisonment and go sparkling to the sea, when the streams of melting snow babble to the stars in

> "The hopeful, solemn, many-murmured night,"

that, too, is the work of the great spring goddess, while in the hearts of all mortal creatures she works a no less miraculous resurgence. It is she who brings back the purple swallow at the appointed day, and whispers the time of year to the flame-bright crocus under the mold. It is she also who puts mad fancies into the heads of imperial lovers and wild March hares. For before her not only is there no distinction of persons, but the "flower in the crannied wall," the hunter on the trail, the small green frog in the marsh and the proud prince in his palace are equal in her eyes. It is she also who presides over the unmitigated ardors of earth, and delights in the splendid longings, the impassioned desires, the impossible romantic aspirations of human hearts. It was her madness which came upon Leander and sent him to swim the Hellespont to his death, for the sake of a girl's kiss.

For no weightier reason, how many a man has gone to his doom in the glad, fragrant hours of some lengthened twilight of spring, with the green pipes of the frogs sounding in the meadows, and the still, small magic flute of desire answering in his breast! Over the hills or beyond the sea dwelt the remembered shape of beauty, beckoned the vision of alluring loveliness, echoed the silver sound of irresistible laughter, and he could do nothing but follow the old irremediable path of destiny and joy. Let prudence lay up saws and experience inculcate caution as they will; it is not in the nature of love to count the cost. Youth knows a better wisdom in the infatuated gladness of the lover, and those whom the gods love die without ever being disillusioned. Crazy in the sight of the world, they go to their graves with no care upon their brow, unreluctant to the last. Of a metal too fine to be tarnished by the corrosive air of life, they pass in charmed immunity through the scurvy environments of struggle and selfishness and greed, child-like, instinctive, single-hearted, guided forever by the divine insanity.

It is not only in the tender pursuits of youth that the inescapable March madness reveals itself. It is made patent in all the undertakings of men. Wherever there is a touch of the visionary and the extreme there are its symptoms appearing. We may be sober, diligent, God-fearing, impeccable, stanch as church wardens and dependable as a stone wall, yet make no more than a decent demise after all. For all our sedulous anxiety to keep the Commandments, we may go down to the pit with none to grieve above us. The local paper may give us a stickful of perfunctory eulogy, our possessions will be scattered among our relatives, and the sum total of the matter is not much more than a name and two dates on a

headstone under a sighing willow. Of such is the kingdom of the world. It is all very well and very right and very necessary, but alone it is not enough. You will find that whenever a man is remembered and beloved beyond the day of his great departure, there has been a touch of the unusual and extravagant about him in some direction. However commonplace he may have seemed for the most part, it will turn out that those who knew him best were acquainted with exaggerated and unusual traits in his character, vagaries and predilections out of the ordinary, generous promptings of self-forgetful folly, which endeared him to them more than all his unwavering rectitude. For it is not what we expect of people that makes us love them, but their unasked, unrequited and lavish actions. The soul is not happy in exactitude, but loves the overbrimming measure. The mean and calculating wisdom of the market-place is abhorrent to it, and the wasteful, splendid, unstinted dealings of Nature are the only method it knows. Who ever heard of keeping a tally in friendship, or doing a kindness for the sake of gain? Surely that were the very embodiment of blasphemy against the spirit of love! Yet that is the custom of traders and politicians and money lenders and all the sleek complacency that rules the world. Alas for them! They despise the unsuspecting gentleness of Utopian dreamers, they have cast out all childish and impractical faith from their mind, and have made themselves lords of their fellow men, only to lose the greatest of all treasures at last—a radiant spirit and a contented heart.

We aver glibly enough that aberration always goes with genius, but we make a mistake when we expect genius to exist without aberration. Nature progresses steadily but unevenly, here a little and there a little, now at one point, now at another. It is the very hight of her intention to produce a perfect individual, to embody the beauty of the normal in the single instance. Toward this ideal she is always tending, yet how seldom she seems to attain it, even remotely! The impossible hopes and aims of the altruist make him peculiar—make him a variant from the average type of man. Any great capacity in one direction or another, which we call genius and hold to be a kind of inspiration, makes its possessor conspicuous. It does not make him abnormal, for that is the one direction in which he is permitted to approach the normal a little more closely. If he were allowed to approach it in all directions,—if he could have strength of body and power of mind, for instance, commensurate with his noble longings and imaginings,—the creature of genius would be human no longer, but divine. And it is not permitted any one mortal to run so far ahead in the great procession.

It does not need any philosophy, however, to appreciate the March hare's enthusiasm. We all know how the feeling of young spring takes hold of him, when the sappy buds begin to swell and the sleeping rivers begin to murmur in their icy dungeons. We, too, have our seizures of restlessness, our longings to wander, our admonitions of splendid discontent, when the sun passes the equator and the hours of sunshine lengthen toward the season of flowers. For us also routine becomes irksome and common sense the only delusion. It is the time for rejuvenation upon the earth, when age looks on youth with an envious eye, and the soberest beef-eater among us is wont to put by his accustomed habit of prudence for the gayer garb of some more reckless virtue. It is not enough to be sound citizens, forsooth, and scrupulous upholders of things as they are; we must revert to the days of our pupilage and taste once more the intoxicating savor of romance. Perhaps we have accumulated an enviable store of worldly wisdom, venerable with the dust of time, and are hoarding it against ravages of age. Of no avail is our fatuous precaution. The first breath of spring wind blows it all away, and we go merrily forth upon the great adventure as empty-handed and daring as when we first began. It may be hard to learn instruction from our elders; it is a hundred times harder to forget the counsels of our own youth. The heart's great by-laws of intrepidity and hope need neither to be written nor taught; they were promulgated long before our puny civilizations were dreamed of, and they will guide many generations when our hands have let go of all temporal affairs. The forethought of the ant may be a sufficient providence against the perils of winter, but we must have a touch of the March

madness of the hare, if we would come happily through the round year. It is not enough to avoid disaster and penury and mischance; the stones of the field accomplish that better than we. We needs must have "a bliss to die with, dim descried," if we would save ourselves from the consciousness of ultimate failure. You may very well think to get yourself through the inexorable portals of heaven under the patronage of Socrates and Newton and the Lord of Verulam, of the seven wise men of Greece and the seventy wise men of modern days. But, pray, were they not all mad together? Let me take my modest chance with the timorous March hare.

NEW YORK CITY.

Senator Hanna and the Labor Problem

BY RALPH M. EASLEY

[Mr. Easley is the one to whom credit is chiefly due for the success of the National Civic Federation He is now the chairman of its Executive Council. The following article shows what was the greatest interest in Senator Hanna's life during the past few years.—EDITOR.]

THE editor of THE INDEPENDENT has asked me to write of Senator Hanna's connection with the Civic Federation—of how he came into the movement, of his interest in it, and something of his method of work.

Senator Hanna came into the Civic Federation only after he had studied its aims and practical workings, after he had assisted as a sympathetic outsider in several of its undertakings, and after the value of his influence, his sincerity and earnestness had removed certain prejudices rather generally held at first by members of the organization.

When the Industrial Department of the National Civic Federation was organized, at a national conference held in Chicago in December, 1900, a plan of procedure was outlined and a committee of twelve was appointed to promote the work. This committee met in January, 1901, and increased its membership to forty. Senator Hanna had not then heard of the Federation, and no member of the committee surmised that he would ever be identified with its work.

One of the new members then chosen was his son, Mr. Dan R. Hanna, the active manager of the business of M. A. Hanna & Co. He was chosen, not because he was the son of Senator Hanna but in spite of that relationship, and because he was at the head of the Association of Dock Managers, which made joint trade agreements with the longshoremen.

By the middle of February the anthracite miners began agitating for a contract with the operators, as the agreement reached in September, 1900, was to expire on the 31st of March. They met in convention at Hazleton and voted to strike on April 1st unless their executive officers should secure an agreement before that time. The new Conciliation Committee found work before it at once, and those who had been frightened over the connection of a "Hanna" with the movement were the first to see that the situation required not only the help of Mr. D. R. Hanna, but that of his father as well, and Senator Hanna's aid was invoked.

Many of Mr. Mitchell's friends had said to him, "Mark Hanna was all right in 1900, when he wanted to use your organization for the benefit of the Republican Party; but you will find that he is now too busy to do anything." These critics who credited Senator Hanna with having settled the Anthracite strike of 1900 as a campaign measure were soon silenced by the Senator's quick response to the Civic Federation's request for aid. He arranged to come over from Washington to New York on the train with Mr. J. P. Morgan, who was returning from the South and who was the particular man to be approached

MARCUS A. HANNA

in this emergency. Mr. John Mitchell, Mr. D. J. Keefe, Mr. D. R. Hanna and I met the Senator at the Waldorf, and agreed on a plan of action, and within twenty-four hours Mr. Mitchell and Senator Hanna were in a conference with representatives of the anthracite roads, at which a satisfactory agreement for a year was made and the threatened strike averted. This had all been done so quietly that the press thought the strike had been averted by a delegation from Scranton, headed by Father Phillips, who called on Mr. Morgan two days later.

It was during that visit to New York that the plans of the Civic Federation were explained to Senator Hanna, and he said that he was in sympathy with the objects, and that as long as we should keep on those lines we could command his support. He stated that the joint trade agreement idea, which the Civic Federation was promoting, was one that he had supported ever since 1874, when he organized the coal operators in Ohio.

The next time the committee called on him for aid was in connection with the United States Steel strike, in the following July. Throughout this strike he was in close touch with our Conciliation Committee in its campaign, which ended in bringing about the Gompers-Mitchell-Sargent-White-Jenks conference with President Schwab and his committee at the headquarters of the United States Steel Corporation. It was the practical work done by the committee in this strike that finally convinced Senator Hanna that the movement was worthy of every possible encouragement. By this time, also, those in the organization who had been fearful of the political motives attributed to him had come to believe that he was absolutely sincere in his interest in the cause of conciliation. He was invited to become a member of the committee and at the first annual meeting in December, 1901, held in New York City, he was made President. The comments of the press on that meeting showed conclusively that the country itself had come to believe in Senator Hanna's sincerity. Evidence of this is found in the fact that out of some two thousand editorials on this almost sensational meeting of capital and labor less than twenty-five questioned his motives, and not one of these was in an important paper. So much for Senator Hanna's introduction to the work.

In his methods Senator Hanna was always direct and to the point. His wide and influential acquaintance was of especial value, and he knew just the wires to touch to reach the seat of a controversy. Night or day, whether in Washington, in Cleveland, out on his campaign, or wherever he might be, he would respond to telephoned requests to give advice or to call up a friend who could be helpful in any particular case. But he always wanted to know the merits of the contention, unless the two or three organizations he had personally dealt with, such as the Longshoremen, the Mine Workers, and the Association of Street Railway Employees, were concerned in it. If one of these was interested he would request a conference for the head of the organization with employers, irrespective of what the particular contention might be. For instance, Mr. W. D. Mahon, President of the Amalgamated Association of Street Railway Employees, called at our National headquarters about the first of November, while Senator Hanna was out on his Ohio campaign, and stated that he had exhausted every means within his reach to secure a conference with the President of a certain street railway company, and that unless such a conference could be secured within 48 hours he could not prevent a complete tie-up of the road. A telegram to Senator Hanna explaining the situation caught him at Toledo. He at once wired to a brother Senator, who was interested in that particular street railway, asking him to grant Mr. Mahon and his committee the conference they desired. The request was complied with and the matter was amicably settled.

On the other hand, when a strike on the New York, New Haven & Hartford Railroad was about to take place last spring, on account of the refusal of the then President to meet national officers of the brotherhoods, and Senator Hanna was called up in Washington and asked if he would secure a conference for Mr. E. E. Clark, Grand Chief Conductor of the Order of Railway Conductors, with Mr. J. Pierpont Morgan, one of the directors of that road, he asked: "Well, what is the controversy about?" "Are the men right in what they are asking for?" Mr. Clark happened to be in Washington and he was advised to see Senator Hanna, who at once telephoned to Mr. Morgan. The interview was granted the next day and resulted in the threatened strike being averted.

It will be remembered that in the anthracite coal controversy of 1902 the Civic Federation brought the operators and mine workers together at its headquarters twice and arranged for them to meet later as Mr. Baer's office. The public, as well as the committee, believed at that time that the strike would be averted. After they had been in conference for two days Mr. Mitchell reported at headquarters that they had failed to agree, and wanted the Senator to call the committee together again to hear their report. The request was telephoned to Senator Hanna at Washington, and he was dumfounded at the information.

The country had been led by the press to believe that the matter was practically settled. The Senator said: "There is no use calling a committee together to hear such a report as that. We must change that report." He went back of the presidents of the roads and undertook to bring pressure on the stockholders, getting a committee of them together in one of the large banks and talking with them over the telephone for two hours. He cabled to interests in Europe. In fact, every force that could be brought into play was appealed to. On the labor side of the matter he urged Mr. Mitchell to give the lowest possible figure he would recommend his men to accept, which was a five per cent. increase (they were asking for 20), and this information Mr. Charles A. Moore and Mr. Frank P. Sargent conveyed to the presidents of the roads; but they spurned the suggestion, so certain were they that the men would not vote to strike. Senator Hanna, when informed of the results of this visit, said, disgustedly, "Well, they will not only strike but they will get ten per cent. increase before they settle." They were finally awarded ten per cent., and, in addition, given a sliding scale which amounts in some instances to seventeen per cent.

While the Civic Federation went out of the case at this point, so far as the public was concerned, Senator Hanna and the committee were at work up to the hour of the settlement. At one time, when some of the operators had been criticising the Civic Federation, Senator Hanna sent this word: "You tell them that if I hear any more of that kind of talk I will go to New York, hire Carnegie Hall, and give them something to talk about." At another time, when he was informed that certain operators had said that he was simply working in the matter in the interest of a supposed Presidential boom, he replied, "You go and tell the operators that if they will arbitrate their differences with the miners, I will make an affidavit that I will not only refuse to accept the nomination for the Presidency, if tendered to me, but, if elected, will refuse to qualify."

In organizing local branches and in arranging for public meetings we always encountered those who, differing from Senator Hanna in politics, honestly doubted his sincerity in the work of the Civic Federation; but I do not know of an instance in which every vestige of this prejudice was not removed when Senator Hanna had spoken.

No better evidence of his deep interest in the work could be given than the statement Senator Fairbanks made to me in Washington last week at the funeral. He said, "I have heard Senator Hanna say at least a dozen times that if he found that his work in the United States Senate would in any way embarrass the work of the Civic Federation, he would resign from the Senate." Mrs. Hanna stated to a friend that she tried to prevail upon him not to attend the annual meeting of the Executive Committee held in New York on the 18th and 19th of last December. He had practically been confined to his room with grip for two or three days, and there was every physical reason why he should not attempt such a trip at that time, but she said she could not dissuade him. He said his duty was here, that there were important matters to take up and he must not absent himself. He came over on the Congressional Limited, Thursday afternoon, December 17th, and I met him at the Waldorf on his arrival. He was hardly able to stand and said he must go to bed at once. He asked a few questions, such as, "Is everything all right?" and "Will they all be here?" When affirmative answers were given he said, "That's good. I'll be all right in the morning; good night." He presided at two sessions of the committee on Friday, the 18th, and on Saturday, the 19th, from ten o'clock until one, and took a keen interest in all the questions discussed.

His son, Mr. Dan R. Hanna, told me at Cleveland last week that the Civic Federation was Senator Hanna's "especial pet." "We all knew he would drop any of his business at any time for it," he added. "The Civic Federation was the dearest thing to Mark's heart," said his brother, L. C. Hanna, "and when he stated in an interview recently that he intended to consecrate his life to this work we all knew that he meant just what he said." The following is an extract from the interview referred to,

which was given by Senator Hanna to the *National Magazine,* and printed in the February number:

"I took some time to consider the work of the Federation, and am firmly convinced that it is the object to which I desire to consecrate the remaining years of my life. I fully appreciate that it is a long struggle, but the progress already made under the motto of the Civic Federation—the Golden Rule—has surpassed even my most sanguine expectations; and I am sure that the American people will sustain a policy, based upon the highest moral and social impulse, which will eliminate passionate prejudices that now exist between capital and labor."

Just prior to the annual conference of the Civic Federation, held in Chicago last October, a number of representatives of employers' associations announced that they would call a meeting after the Civic Federation's meeting for the purpose of nullifying the conciliation policy of the Federation and to organize to fight the unions. No reference was made to this announcement during the conference, but at the banquet that followed, Senator Hanna used these words:

"I want to make an appeal, and I wish my voice might reach from the Atlantic to the Pacific Ocean in the making of that appeal, to the business men and those in charge of these great industries in the United States. 'Don't organize for any other purpose than mutual benefit to the employer and the employee. Don't organize in the spirit of antagonism; that should be beneath your consideration. If you are the stronger or abler, much less excuse you have to show resentment because the other side is simply asking that they have their share. There is an honest difference on the questions that enter into the cost of production or any of the details in the ramifications of the manufacturing business, and as honesty of purpose is shown and demonstrated, the easier it makes it for a settlement that is right and fair.'"

New York City.

The Venezuela Award

BY WAYNE McVEAGH

Senior Counsel of the United States Before The Hague Tribunal

IN reply to the request of The Independent for an expression of opinion upon the decision in the Venezuelan arbitration, I do not know that I can do better than quote the words from my article in the *North American Review* last December:

"Thirteen independent nations, seven of them great and leading nations of the world, alike in civilization and in military and naval power, have voluntarily been represented in this arbitration. Such a precedent thus set in the face of the world cannot fail to exert a very weighty influence in any future controversy. If Great Britain, Germany, France, Spain, Italy, the Netherlands, and Sweden and Norway in Europe and the United States, Mexico and Venezuela in America, have appeared at the bar of The Hague Tribunal . . . it will be exceedingly difficult for any nation in the future to refuse to submit her contentions to the same arbitrament. . . .

"It is confidently believed that the Venezuelan arbitration marks an uplifting epoch, and that its value in increasing the dignity and enlarging the usefulness of that great Court of Peace will be more and more apparent . . . *without reference to the actual decision in the present case.*"

For my own part I was never too hopeful of securing a decision in favor of peaceful methods of adjusting disputes by great European Powers with a weak and defenseless South American republic. The judges, I feel sure, decided as they thought it their duty to decide, and it is the first duty of parties to arbitration to accept whatever decision is rendered with entire acquiescence. They have given the United States a mark of their respect and confidence in asking our Government to act for the Court in deciding how the expenses of the Tribunal should be properly apportioned among the different countries appearing before them.

As the blockading Powers had, by the blockade, produced the fund for distribution, their claim to preferential payment

out of the fund could only be defeated, if at all, by persuading the arbitrators that it was their duty as judges of The Hague Tribunal to look at the broad, ethical question which Mr. Bowen had presented very clearly, both in correspondence and in the protocols, and to examine and decide whether Great Britain, Germany and Italy, having been voluntary parties to The Hague Conference, were entitled to preferential treatment for having treated Venezuela as they had treated her and whether, indeed, in their conduct toward her they had not violated both the spirit and the letter of the obligations they had voluntarily assumed in becoming signatory parties to the convention of that Conference, which pointed out conciliation, mediation and arbitration as approved methods of avoiding a resort to force.

The arbitrators have decided, however, in favor of the blockading Powers, and I can only repeat that in my judgment the submission of the controversy far outweighs in permanent value any dissatisfaction which may be felt with the decision. Friends of arbitration and of peace must not expect the world's ways to be changed in a day. Nor, perhaps, can arbitrators who are subjects of such great military monarchies as Russia and Austria in Europe, be fairly expected to take a very humane view of the rights of a weak and defenseless South American republic. We must take human nature as it is, even in arbitrators, and it must be remembered that for many years strong nations have been at their pleasure attacking and despoiling weak nations. We must not for that reason abate one jot of heart or hope. We should rather continue our advocacy of the good cause of international arbitration in thankfulness that a great concourse of nations, in the year of grace 1903, actually submitted their contentions to the peaceful adjudication of The Hague Tribunal.

That surely is a great step forward, and while it is true that in every great nation "there lie potentialities of the most barefaced piracy," it is also true that against such piracy there is now being waged, all over the world, a more earnest strife and under more encouraging auspices than ever before. To compel strong nations to respect the rights of weak nations is not the work of a day, nor perhaps of many days, but it is a righteous work, and in the end will triumph, for "the Lord of life is with us and we cannot permanently fail."

WASHINGTON, D. C.

The Venezuela Decision

BY HAYNE DAVIS

THE decision of The Hague Court in the case of the allied Powers against Venezuela and other nations has been received with general surprise and regret. It gives to the allied Powers, who took forcible action against Venezuela, a preference in the payment of their claims over those nations that forbore to take forcible action. It seems wrong to the people of all nations that a law should be acknowledged which sets a premium on violence, and the sense of disappointment which comes with this decision is liable to hide from our eyes the good accomplished by the reference of this question to The Hague Court, and by the adjudication of the various claims against Venezuela. In fact, the first feeling is that international arbitration fails to accomplish justice among nations. It is thus important for us to look closely at what has been accomplished in this arbitration.

In the first place, the amount justly due from Venezuela to other nations was referred to arbitration, as well as the question whether the nations which took forcible action to collect their debts are entitled to preferential payment. The claims against Venezuela have been reduced by two-thirds or

three-fourths. Germany's claim for $1,200,000 is reduced to $384,000. Manifestly the just determination of the amount due from Venezuela to each of these nations was far more important than whether certain creditors could collect their due in advance of others. The arbitration of the matter has, therefore, relieved Venezuela of many millions of dollars which were unjustly claimed to be due from her to other nations. This being true, the arbitration of the question has resulted in a much larger measure of justice than the forcible collection of these claims would have done.

Of course, the giving of the preference to those nations that resorted to force is a failure of justice; and it is a good omen that the decision of the court to this effect is a shock to the sense of justice. And yet let us compare it with the decision one of our State courts would give in a similar case—that is, in the case of an individual against whom one or more creditors have taken action and pressed their claims to execution and levy. The courts would be obliged to protect the judgment creditors, in any priority acquired by their action, against the claims of forbearing creditors. And it sometimes happens that those who press for payment get all the property of the debtor to the total exclusion of the more lenient creditors. This is essentially unequal and unjust, and our law has provided two ways of preventing this, one open to the debtor and one to any creditor. The debtor can make a general assignment of all his property for the benefit of all creditors, and so prevent any preference being acquired by those who bring suit. Or one creditor can file a general creditors' bill under which all creditors can come in and share pro rata in whatever is realized out of the debtor's property. Either of these proceedings, if taken before a lien is acquired by levy on property, will prevent any priority being acquired by the pressing creditor, but they cannot do away with a priority actually acquired according to the proceedings and practice allowed by law.

Now, sending a war ship to collect a claim against a nation is analogous to an individual obtaining a judgment and sending a sheriff to levy on the property of an individual debtor. Actual levy by war ships would be analogous to actual levy by a sheriff. But there is this vital distinction, that an individual must prove the justice of his claim, whereas a nation can proceed to violent collection of the amount it claims without proving to any one that it is just.

Again, the debtor nation has no way of insuring pro rata payment to all creditors, except by consent of the pressing creditors; nor can any one nation prevent the pressing creditors from securing priority. All the forbearing nations can do is to become forcible collectors of their own claims, and those who have secured spoils by acting first may or may not consent to sharing them with newcomers on the field of action. The Venezuela decision, therefore, brings two errors to light; and revealing errors is a long step toward correcting them. First, the law of nations needs to be amended, and, second, a better method of amendment than now exists is imperatively demanded.

First, the law of nations needs to be amended so that no nation shall proceed to forcible collection of a debt without first securing a judgment of the Court of Nations that the same is just, and so that either the debtor nation or any creditor nation can apply to the court and turn the proceeding into a general creditors' bill, so that all creditors can share alike in the money realized, after first proving the amount justly due them.

Second, as to the present method of amending the law of nations. This can be done only in the way that body of law has arisen—by common consent. This consent may be given by acquiescence in a course of conduct for a long time; or it may be secured by the interminable process of treaties on the same subject entered into by each nation with all the others; or, a common treaty may be negotiated between all the nations, as was done in the creation of The Hague Court by the treaty of The Hague. Such a treaty would issue out of a conference (like that held at The Hague) in which all nations were represented, and would reflect the common sense of the world on the subject.

Certainly such a conference ought to be called to amend the law so as to prevent preferences in favor of the nation first resorting to force; and this conference, if convened, should be at liberty to consider and make suggestions on any matter of international interest —such as the questions raised at The Hague Conference and acted on adversely or not acted on at all.

The nations ought to take advantage of this very instructive incident to put themselves in a right relation to each other, so that there may be a way of meeting all such matters as they arise hereafter. The way to do this is by establishing a permanent international congress, authorized to initiate amendments to the law of nations, the same to become binding on the nations when ratified by an agreed number of National Legislatures, or when not vetoed by an agreed number.

The conditions in which we live not only call for but require that this be done. The call for the establishment of this body should come from the United States. By making this call, and continuing to make it till it is heeded, the United States will become the greatest factor in the establishment of international and universal justice.

New York City

Richard Strauss and His Music

BY G. W. HARRIS

[The arrival of Richard Strauss in America this week makes the following very appreciative article by Mr. Harris most timely. Besides directing in New York City a "Strauss Festival" of several concerts and recitals devoted to his own compositions, and presiding over the Philharmonic Orchestra at its brace of concerts on March 4th and 5th, Herr Strauss is to conduct orchestral concerts in Boston, Troy, Philadelphia, Pittsburg, Buffalo, Scranton, Toronto, Detroit, Cleveland, Indianapolis, Cincinnati, and Chicago; and recitals of his songs are to be given by his wife in most of these and several other cities. It may be seen that he intends to spread his gospel over the greater part of the North American continent.—Editor.]

IN a "musical season" already notable for its riches in opera and concert, and, above all, great orchestral conductors, two occurrences will stand out pre-eminently and mark this, probably for a long time to come, as the most memorable year for music in America. The first of these was the first performance outside of Baireuth of "Parsifal." The second is the coming of Richard Strauss —Dr. Richard Strauss, his friends and business agents are now advertising him —of Berlin, who stands in a class by himself, a towering young giant among contemporary musicians—one, indeed, whose position in the world of music to-day is not unlike that of Richard Wagner fifty years ago, when he went to England to conduct the old London Philharmonic Orchestra.

While Herr Strauss has stood in the forefront of orchestral conductors in Europe for several years, it is as a composer that his fame has gone round the world. And America has done its full share in fostering that fame, for many of his most notable pieces have been performed by the New York Philharmonic, the Boston Symphony and the Chicago orchestras almost as soon as the scores came from the printer. Tho he has not yet completed his fortieth year, this man has produced nearly four hundred distinct compositions, covering practically every field of musical activity—and most of his works have been published. These include music dramas, symphonies, overtures, "tone-poems" of vast scope and astounding virility, concertos (for piano, violin and horn), string quartets, serenades, piano pieces, sonatas, mixed and male choruses, anthems, hymns, and more than one hundred songs.

In art as well as in other things the quantity of a man's work counts for little unless that work has quality also. But one of the surest tests of greatness is the union of the two. There is hardly a single

piece of composition written by Strauss since he reached maturity, be it large or small, that is not imbued with that peculiar, individual quality of his that has set the critics to quarreling and the world to talking, and filled many a music lover with new joys. His music (as was in its day that of every really great composer the world has ever known) is revolutionary. To appreciate this new music, what it is, what it means—to understand anything of its author's aims and intentions, to hear it and get out of the hearing the best inspiration, the highest uplift, the greatest esthetic pleasure—what you will —it is necessary to know something about the man and his work.

Richard Georg Strauss was born in Munich on June 11th, 1864. His father, Franz Strauss (born February 26th, 1822, and still living), was a member of the court orchestra in Munich and one of the finest horn players in Europe. He composed several works for his favorite instrument, and his son says "he could play most of the instruments in the orchestra." Richard received his first music lessons at the age of four and one-half years from his mother, who was the daughter of a well-known brewer named Pschorr. The boy took further pianoforte lessons from August Tombo, a harper, and received instruction in violin playing from Benno Walters. When six years old he composed a polka, and soon followed this with a Christmas song, of which it is told that he wrote down only the music, and his mother had to write the words because he could not make them small enough to go under the notes. In rapid succession he then produced songs, pianoforte pieces, sonatas and an overture for orchestra. *The London Musical Times* recently quoted an amusing anecdote from his father, telling how Richard's mother used to cover his school books with music paper and how the precocious boy composer utilized these coverings for scribbling his musical ideas during the progess of his lessons. Young Strauss's first professional teacher was Hofkappellmeister F. W. Meyer, of Munich, who took his pupil through a course of strict counterpoint.

The first public performance of any of his compositions occurred in 1880, when three of Strauss's songs were sung by Fraulein Meyenheim, the opera singer.

RICHARD STRAUSS

In the following year a string quartet was performed by the Benno Walters Quartet. Soon afterward Hermann Levi brought forward a symphony in F-minor, written when Strauss was sixteen years old, which attracted wide attention. In 1883 an overture in C-minor was produced by the Berlin Philharmonic Orchestra. Meanwhile Strauss had met Raff at Weisbaden, who seems to have turned him over to Hans von Bülow, then conductor of the fine orchestra of the Duke of Meiningen, and in 1883 also von Bülow performed the "Serenade for Wind Instruments" (opus 7), to which he took a great fancy, repeating it at many concerts on tour. At about this time Strauss accepted a violinist's place in the Meiningen orchestra, of which he soon became concertmaster. When von Bülow resigned as conductor, in November, 1885, Strauss was appointed as his successor. He remained until the Duke proposed reducing the orchestra, one year later, when he went to Munich as associate conductor. From Munich he went to Weimar in 1889 as court conductor. In these places he made a highly honorable and distinguished record, and in 1894 he be-

came conductor of the Berlin Philharmonic Society, and four years later was made director of the Royal Opera at Berlin, which post he still occupies.

Notwithstanding his arduous duties as conductor, Strauss continued from the day of his Meiningen engagement to find time for creative work. In the formative period of his life, he says, his father kept him very strictly to the old masters, and in their compositions he had a thorough grounding. Elsewhere we are told that altho the elder Strauss came under the influence of the Wagner furore, he stoutly refused to become a Wagnerian. On one occasion, after he had most exquisitely performed the first horn part in one of Wagner's works, the composer facetiously remarked: "I fancy, after all, Strauss, you cannot be such an anti-Wagnerian as they make out, seeing that you play my music so beautifully." "What has that got to do with it?" answered the unrelenting horn player. The influence of his tastes and his discipline is shown in the early works of his son. The Symphony in F-minor, which first attracted to Richard Strauss the attention of the musical world, was chiefly interesting because it displayed a technical facility highly remarkable in such a young man. It was a thoroughly orthodox work in the classical form, serious and respectful in spirit. There was nothing revolutionary about it.

But in 1885 Strauss became acquainted with Alexander Ritter (born 1833, died 1896), an ardent admirer of Wagner and the romantic music of the nineteenth century, who had married Franziska Wagner, a niece of Richard Wagner, in 1854. The acquaintance soon ripened into intimacy, and this man influenced the young composer mightily. Strauss himself has said:

"Before I knew Ritter I had been brought up in a severely classical school. I had been nourished exclusively on Haydn, Mozart and Beethoven, and then I became acquainted with Mendelssohn, Chopin, Schumann and Brahms. It is through Ritter alone that I came to understand Liszt and Wagner."

In his twenty-second year Strauss journeyed to Rome and Naples, and then gave the result of his impressions to the world in a symphonic fantasia, "Aus Italien" (written in 1886). Each of its four movements carried an explanatory title somewhat similar to those used by Beethoven in the "Pastoral" Symphony. This was his first modest step toward program music. In 1887 he suddenly threw off the trammels of classicism and began his amazing series of "tone-poems"—compositions for the grand orchestra—of the most revolutionary character and tendency ever known in the history of music. The first of these was "Macbeth," the score of which was dedicated to Ritter. There was no explanation or guide except the word "Macbeth" written over a theme, the annotation "Lady Macbeth," later in the work, and a quotation from Shakespeare's tragedy.

This was followed in 1889 by "Don Juan," a musical gloss on a dramatic poem of that title by the celebrated Austrian poet Lenau, which was published and heard before "Macbeth," receiving its first performance at Weimar in the autumn of 1889 under the composer's direction, and which "was received," it is said, "with great applause." Then came "Tod und Verklärung" (Death and Apotheosis), which was brought out at Eisenach in 1890. After it had been performed Ritter wrote an explanatory poem for this work.

Strauss's health broke down from overwork in 1892, and a period of rest and travel was ordered by his physician. He visited Greece, Egypt, Sicily and Upper Bavaria. But the "mental pot" kept boiling, and while on his travels he composed his first lyric drama, "Guntram," for which he wrote both the words and the music. This opera was produced at Weimar on May 12th, 1894. Fraulein Pauline de Ahna, the daughter of a Bavarian general, sang the part of the heroine, and sang it so completely to the satisfaction of the composer that he asked her to marry him, which she did toward the end of that year.

Back at the conductor's desk Strauss began again in 1895 the production of tone-poems with "Till Eulenspiegel's Merry Pranks," the most humorous piece of music ever written, as well as one of the hardest nuts the composer has given his hearers to crack. In 1896 he wrote "Thus Spake Zarathustra," a tone-poem founded on certain passages from Nietz-

sche's book of that name. In 1897 came "Don Quixote," a set of "fantastical variations on a theme of a chivalric character;" and in the next year "Ein Heldenleben" (A Hero's Life), which was first performed at Frankfort-on-the-Main, March 3d, 1899, Strauss conducting. This tone-poem, which has been called "the latest and the most copious word that has been spoken in instrumental music," swept over the world like wildfire.

Strauss's second opera, a one-act piece called "Feuersnoth" (The Fire Famine), had its first performance at the Dresden Royal Opera on November 21st, 1901. It has since been performed in Vienna and several other cities of Germany and Austria. His latest work, which is still in manuscript, is called a "Sinfonia Domestica," and is said by the composer's friends who have seen the score or received Herr Strauss's confidences to be wholly and remarkably different from everything that has preceded it from his pen. Its initial performance is promised for the coming "Strauss Festival" in this city.

In this rapid survey of the works of the man no mention can be made of his hundreds of songs, his pianoforte pieces, his writings in the chamber music class, or his musical setting for Tennyson's poem, "Enoch Arden" (for piano). Enough has been said, however, to give the reader some idea of the marvelous capacity of Richard Strauss for work.

Over the later compositions of Strauss the critics have waged a wordy war. There has been no such commotion in the world of music since Richard Wagner began to astound and confound the old classicists with his wonder-works.

In orchestral music Wagner went further than any man before him. Strauss has gone leagues beyond Wagner. His music is not a continuation of Wagner's. It is too individual and original for that. It does not antagonize Wagner. It cannot supersede Wagner. But it exhibits a consummate artistic technic and a profound scholarship never dreamed of by Wagner, great as that master was in all these things.

For these new creations of his Strauss, discarding the name "Symphonic poem," which had been used by Berlioz, Liszt, Tschaikowsky and Saint-Saens, his great predecessors in the realm of "program music," chose the term "Ton-Dichtung" (Tone-poem), to show the predominate importance of their purely musical character, that they are subjective and do not follow too closely any definite objective program. For Strauss is a psychologist in music—he translates thought—that is, philosophical ideas—into tonal emotion. Technically the most distinguishing characteristic of his pieces is the continuous employment of polyphony (the simultaneous development and interweaving of many themes). This was almost unknown in the symphonic poems of Berlioz and Liszt, which were mainly homophonic. These tone-poems are really dramatic monologues, in music, of vast proportions. The conception of them may best be characterized, perhaps, as a sort of transformation into another art of Robert Browning's poetical invention known by that appellation. In them, as the English poet gave lyric utterance in his "Dramatic Lyrics, Idyls and Romances," the composer gives musical expression to elements of a dramatic, and also of an epic, character. He fuses into one poem the lyric, dramatic and epic qualities which aforetime were employed each by itself in a separate art form.

For his tone-poems the composer furnishes no detailed programs. Their titles, sub-titles and even quotations are used simply as hints or suggestions of the ideas, moods, emotions intended to be conveyed. Yet his commentators, friendly and unfriendly—and an army of them has sprung up in Germany—have published elaborate descriptions and explanations of every one of his later compositions. Some of these analyze every theme, give significance to every melodic phrase and discover esoteric meaning in every modulation. No doubt Strauss himself has had many a hearty laugh at the owlish solemnity of some of these interpreting pamphleteers, for he has shown himself not without humor on more than one occasion. Technically these pieces are far from absolute independence of form. Their music is ruled by laws of development even when the subject invites a special color or tendency. As has already been said, in the development and interweaving of his themes Strauss is a virtuoso of astounding skill.

His wildest compositions possess a certain unity and are perfectly logical in thematic statement and in counterpoint.

It has been said that classical music is the expression of beauty and modern music the expression of truth. But this distinction loses sight of the artistic canon long ago enunciated that beauty and truth in their highest estate are synonymous. This music of Richard Strauss (putting aside all considerations now of his marvelous technical mastery) is great and good music, because it presents truth in a new garb, which, when we become familiar with it, is seen to be of surpassing beauty. To say that it is not good or "legitimate" music because its beauties are not at once apparent to every hearer is the shallowest kind of criticism—indeed, is not worthy the name. It is axiomatic of all art history that new conceptions of the beautiful always have to wait for appreciation until the lovers of the beautiful become familiar enough with them to apply the new standards set up by the producing artist himself. Even the string quartets of Mozart, to-day considered the most suave and melodiously euphonious compositions of their kind, were "too highly seasoned for any palate to endure" according to his contemporaries, and that great composer (of his day) Sarti attacked Mozart as "a barbarian quite without an ear, for having written in these quartets wholly unbearable music, full of glaring violations of all rules." To Dr. Samuel Johnson and his fellows Thomas Gray was an obscure poet.

While it would be absurd to say that music can be made to delineate the physical aspects of men and things, in the hands of Richard Strauss it can and does give us mental pictures of the characters he presents. And what pictures they are! It is generally conceded among civilized people that the joys of the mind are supremer than the pleasures of mere sense. Appreciation of this new music means simply the admission of that fact. It stirs and stimulates the imagination of the sympathetic listener as no other music ever did. Strauss portrays the striving, the reaching out of the human race after the infinite. He lifts us to the mountain tops of feeling. His music is not pessimistic—is not destructive in effect. There is nothing decadent about him. If emotion is the only thing worth while in music, here is the greatest master of emotionality of our time. It is, perhaps, too soon to say, as some of his European admirers have said, that he is the greatest composer the world has ever seen; but he is assuredly the greatest of the lords of music now alive—and the twentieth century belongs to him.

New York City.

Poe's Purgatory

BY JOHN B. TABB

All others rest; but I,
Dream-haunted, lie—
A distant roar
As of tumultuous waters, ever more
About my brain.

E'en sleep, through fain
To soothe me, flies affrighted; and alone
I bear the incumbent stone
Of Death
That stifles breath,
But not the hideous chorus crying "Shame!"
Upon my name.

Had I not song?
Yea; and it lingers yet
The souls to fret
Of an ignoble throng,
Aflame with hate
Of the exulting Fate
That hurls their idols from her temples fair,
And shrines me there.

An Excursion in Higher Criticism

BY FRANK CRANE, D.D.

[Dr. Crane has written a book entitled "The Religion of To-morrow," during the composition of which, no doubt, he obtained his material for the following article. We may add, however, that this article should prove as valuable to the majority of our Greek and Latin Professors as to the Higher Critics of the Bible.—EDITOR.]

A RECENT ministerial meeting discussed the question as to the ethical bearings of the game called *tiddledy-winks.* Becoming interested in this matter I have been at some pains to investigate it thoroughly, and now, with considerable misgivings, offer the results of my research to the public. While presenting the following views with a deep sense of humility and deeply conscious of possible errors in judgment, yet it seems to me that the eminent authorities quoted should have considerable weight.

Note, first, the nature of the issue. The question is not whether the game of *tiddledy* is harmful to the young, nor the game of *winks,* but *tiddledy-winks,* a compound expression, embodying two ideas in one. Each part of the given subject should therefore be separately examined, and the mutual interactive influences of each upon the other carefully gauged.

Taking up the first seed-thought, *tiddledy,* we may as well dismiss at once the theory (Meyer, Olshaufen, Katzenellenbogen, Schnupfenannehmen) that this has any reference to one T. D. Winks, a prominent controversialist of Amsterdam in the sixteenth century. This man's name, as appears by abundant proof (Vautrien's "Histoire des Niches," Vol. xi, pp. 79-135. Nichteverstehe's "Ev. of Degen," *ab initio ad fin.*) was not *Tiddeldy* at all, but *Tiddy* (and not *Teddy,* as held by Gebrueder Ensen in "Die Vereinigten Nahren"), the added syllable *eld* being an interpolation by a later hand (not found in B. 17, C., etc.), probably introduced because Winks was commonly reported to be an old (*eld=old*) fraud. (However, cf. *contra* Bavard, tom. 1, dick. 2, hari. 3. Versailles ed. It will also be recalled by the scholar that Kopfweh asked "*Hujus?*" upon this very matter, to which M. Coup de Langue made his famous reply, which shook the learned world to its center, "*Allez planter vos choux!*" See this entire controversy admirably summed up in Long's review, in the Bib. Sac., of Professor Short's "Influence of Art on Things in General.")

The ripest scholarship has decided that *tiddledy* has really a composite origin. Nowhere is the splendid advance of modern philological science more manifest than in demonstrating that *tid* is evidently an abbreviation of *instid* (colloq. for *instead*), simply implying that we can do one thing as well as another, thus capsuling in one syllable the entire literature on the freedom of the will. Our first deduction therefore is that the game may be played by an Arminian, while it should under no circumstances be indulged in by a Calvinist. Methodists may, therefore, play it, but not Presbyterians. (See the great Tweedledum *vs.* Tweedledee Debate, Zion Publishing Company, New York and Chicago.)

The remaining syllable *dle* has been traced to many sources, but from internal evidence we agree with Dummkopf, Cassecou, Valniente *et al.* in holding that it is plainly derived from the word *trundle,* in *trundle*-bed, the syllable *trun* being discarded (*i.e.,* thrown out, or colloq. "trunned out,") and the word *bed* being concealed and finally lost, as the trundle-bed was concealed under the parents' bed. (Lehre v. d. Mittelj. Opp. 111, 391 ff.) It seems from this that only children (*i.e.,* those who originally occupied trundle-beds) should pursue the intricate fortunes of this pastime.

The affix *dy* remains (not *die,* as A. B. Syr. *utr.* Erp., Copt., Cypr., Eph., Lachm. and Tisch. See also Steinfass, who insists, without warrant, we think, "*Du bist nicht recht gesheiht*"). *Die*

cannot be maintained. The chief eschatologists, even those not belonging to the Union, agree that nothing mortuary adheres to this affix. On the contrary, there are grounds for the claim so often made by the early fathers that it is akin to the Latin prefix *de* (Sanskrit *don't it*). But the weight of probability is on the side of Bleek, who claims that *dy* is but a concentrated extract of *tidy*, *t* and *d* being interchangeable linguals. He holds that the first syllable of *tidy* is a mere intensive reduplication, as in the Greek perfect and in the English *papa, mama,* etc. Here, then, we have the third great idea emerging, (as in the classic line,

"*Apparent rari nantes in gurgite vasto,*")

that is, that when Arminian (*tid, instid, instead, choice*) children (*-dle, trundle-bed*) play this game, they ought to be *tidy* and not litter up the floor.

We come now specifically to the word *winks,* which has been a hard-fought etymological battle field. Well may the lover of his kind, as he contemplates the carnage manifest in the history of this word, exclaim against the horrors of war, and indulge the hope that some day the conflicts of the learned may also be settled at The Hague. Billetdoux contended that *winks* is an illusion to the doctrine that the Church ought to *wink* at such things, implying good natured indifference. In this view he was sustained by Deepdigger and Rootgrubber in their well-known grammar (a seventeen-pound book bound in green, an interesting one-dollar-down-the-rest-on-easy-payments volume of the last century), who point out that the Scriptures say, "And the times of their ignorance God winked at." But we are inclined to favor the view of the anonymous author of "Soc et Tuum," who was the first to advance the hypothesis that the root of *winks* is *win,* the *ks* being added for euphony and piquancy. This bold asseveration, which called forth such a storm of opposition, so that three German professors died of apoplexy, was first published in Oddsbodkin's "Encyc. of Lit. and Theol. Hash," and has won its way triumphantly to universal acceptance by sheer force of its inherent probability. There is no scholar of the first rank who to-day will gainsay it. (Mascagni, Frascati, Delmonico and the whole Bologna school simply do not know what they are talking about. Kuno Fischer justly observes, in his pamphlet addressed to them, "*Was fehlt Ihnen?*") The underlying thought, therefore, in *winks* is that the game is not to be played for money—*i.e.,* in order to *win* gold, silver or other collateral.

The conclusion of the whole matter, then, is that Arminian (*tid, instid, choice*) children (*-dle, trundle,* etc.) may play the game, provided that they are neat and good (*tid, tidy*) and do not play for gain (*winks, win*).

We may add that we have followed Abernicht in discarding the rough breathing, see his thirty-six volumes on the Greek Enclitics. It seems to us that the pre-altitudinalists adopt the reading *lucus a non lucendo* against weighty evidence. In closing we may remark truly, in the words of the great leader of modern polemics, "Also! Don't it yet!"

WORCESTER, MASS.

Literature

Mr. Long and the Navy

WHILE ostensibly a history of the Navy* during the administration of its author, Mr. Long's recent work is, in large degree, an appeal to "the next age" for his justification. Those who may look no deeper than the surface will find it pleasantly readable, altho (except perhaps in the chapter of personal reminiscences) it adds little to the facts and comments already published in greater detail. Others will rise from its perusal with mixed feelings of disquietude and regret: disquietude that the Navy should have been governed by one in some respects so temperamentally unsuited for his great office, as Mr. Long has here shown himself to be; regret that a personality so engaging and amiable should thus minister to its own official disparagement after a long career of estimable public service in other fields.

It was perhaps this very kindliness of disposition which denied to the Secretary the strength of fiber and will adequate to the independent self-assertion which his position, especially in war-time, demanded. He was apparently dominated by the "War Board" and yielded to the sway of his Judge-Advocate-General, except when impelled in a different direction by the stronger influence of the Bureau of Navigation; and there have not been wanting in the Navy perhaps over-captious critics to insist that when not pursuing an orbit resultant from these forces his official gravitation was toward the opinions of "the last man who talked to him."

It is not, therefore, an account of the Navy that he has produced so much as a defense of his own actions while in office. When the future historian comes to explain such occurrences as the wild-goose chase of Sampson's variegated fleet to Porto Rico, the conversion of torpedo boats into nerve alleviators and mail carriers, and the deprecation of their offensive use which the Japanese have lately so well demonstrated, the singular terror of Cervera's lost squadron and the silly coast patrol established to guard Long Branch cottages and Nahant bath houses, the miserable Sampson-Schley controversy, the ready preference of politicians' relatives and financiers' sons-in-law for commissions over graduates of the Naval Academy, the large sums paid to patriots disposing of worn-out yachts—all of these things, and many more, he will find illuminated by Mr. Long's various states of mind, and equally, with many praiseworthy and useful accomplishments, will attribute them largely, if not wholly, to the Secretary's immediate counselors and his receptivity of the moment, rather than to his deliberate and independent judgment.

Yet, in a sense, Mr. Long's book is encouraging, since it shows that the efficiency and discipline of the Navy can be relied upon to rise superior to its temporary administrators, and that what it accomplished in 1898 in despite of their shortcomings is, after all, but earnest of its still greater unimpeded achievement, if such the future shall demand.

The chapter of personal recollections is agreeably written and full of anecdote, and it reveals every one in the most favorable light. In fact, the ever reprehensible Schley is the only person whom Mr. Long does not pronounce altogether charming; and, as to him, candidly, if we felt ourselves, in our own defense, compelled once more to rake up that malodorous controversy, and even to reprint the repudiated "Navigator's Chart," we do not believe that we should regard the gallant Admiral one whit more charitably than does Mr. Long.

* THE NEW AMERICAN NAVY *By John D. Long.* Two volumes, with Illustrations. New York: The Outlook Co. $5.00.

After Prison—What?

NOWHERE is optimism more necessary than in philanthropic work. Especially is it needed when we pass the portals of a prison. Courage of a high order characterizes the work of Mrs. Booth, and a dauntless soul burns through the pages of her latest book, "After Prison—What?"* Any other attitude of mind would be fatal to her efforts.

* AFTER PRISON—WHAT? *By Maude Ballington Booth.* New York: Fleming H. Revell Co. $1.25.

The reformer, as well as the poet, needs imagination—not in the presentation of her "flesh-and-blood facts," as Mrs. Booth calls them, but in the power to see "a man's future copy fair his past," in a prophetic vision of a soul redeemed, which brings its own realization through hope and faith and prayer. Is it not George Eliot who mentions the power for good one who believes in us has over our lives? Mrs. Booth believes so completely in her "boys" that it would take great hardihood for a man to disappoint so sweet and secure a faith.

The book is a human document, written from the standpoint of the cell.

MAUDE BALLINGTON BOOTH
Author of "After Prison—What?"

Years have tested the reality of some of the reforms the author has been instrumental in bringing about; there can be no question in any honest mind that these miracles do happen. Mrs. Booth does not dwell on the darker side of the subject, nor follow the "five per cent. who go back to prison," who have struggled vainly to reform. She is always the optimist; otherwise she could not do the work which has been hers for seven years.

"Every soul is precious in the eyes of the great Father in heaven, and beneath the stain and dross of crime and sin must always be some grain of gold worth redeeming. Most people cannot conceive of men of education, refinement or gentlemanly instincts in prison."

That they are there Mrs. Booth proves by many touching incidents and "life-stories" of her friends who are or have been convicts.

Mrs. Booth's personality cannot be ignored in estimating the elements of her success. Perhaps no one else could do her work so well, or at all. Her "boys" love her and call her "Little Mother," recognizing instinctively the motherhood in her attitude toward them. She is a woman of surpassing charm. Her unfaltering trust in God shines steadily through these pages.

Mrs. Booth tells simply the story of the work now being done in State penitentiaries by the Volunteers of America, of the impulse which started this special reform and of its widespread influence. She soon found, as all who study the condition of the prisoner must, that the most dangerous point in his career is at the moment the prison doors close behind him, and he stands, bewildered, in the glare of the world outside. Lost and troubled as to which direction to take, he is an object of suspicion to those he may approach with a request for work; distrusted by the police or sheriff, who shadow him; very little money in his pocket to stand between him and starvation; no sense of self-respect to make his situation bearable. Temptation waits outside that door in many alluring guises. Respectable people will have none of him, but there are those who will give him a hearty welcome—so long as his money lasts, at least—and the descent of Avernus is easy indeed to the lonely man. The reviewer has seen more than one ex-convict turned away from door after door where he sought work, yet persevering doggedly for days in the fruitless quest, because he feared and dreaded to return to the old life, knowing all the while that he could find plenty of the devil's work ready for him to do at any minute, and, in the case of a skilled gambler or forger, that it would be well paid.

"Hope Hall" is the refuge Mrs. Booth has opened for just such men; the touch of "home" life about it, due largely to her sweet motherliness, is the most sacred influence in many a life. The flame of Christianity, which burns brightly in these three "homes," is the same potent guide for sinful men that it was of old in days that are dim with

tradition. Eminently wise, practical and clear-headed in her work of reform, Mrs. Booth finds places for worthy men in various employments. She also interests herself in their families, often left destitute and helpless during the bread-winner's detention in prison. The blessings of grateful men and women follow her everywhere, and to read her book is to strengthen our faith in human nature and in the uplifting power of love and sympathy.

The Kinship of Nature

ALMOST every writer of prose aspires to the use of rimes. He would develop the poetic antennæ of his genius for heavenly ideas and measure them off with the green rod of the Muses. But the poet rarely descends to the literary sackcloth of prose, and when he does, doctors of philosophy should look well to their laurels. For by nature if not by inspiration he is a gospel writer, and even when he chooses the common sentence as a form of expression, the oracular future tense is preserved. We refer, of course, to Bliss Carman's new volume of essays.* And if he is as right as he is sure of what he says, we have some excellent supplementary scriptures on life and art. However, it is very difficult to be right—more difficult even than to be inspired. What we think is so far short of the whole truth, and what we know is so much less, that eventually the dogmatic statement on any subject must become obsolete. And Mr. Carman has made a somewhat violent use of it in his effort to declare the terms of spiritual and intellectual liberty. Still he is right in several directions further than mortal man is likely to reach in actual experience, and he has given some old thoughts the mystery of an esoteric setting in the shadows of his own mind, so that they appear new and formidable. He is a socialist, also, in the ideal and impracticable acceptation of that term; and he has conceived the new heaven and the new earth with less imagination, indeed, but quite as easily as St. John got his Revelations on Patmos. The trouble is that the men and women who must work out the reality of this conception will level many of the high peaks in his doctrines. The way by which the whole world ascends to such ideals must be graded through many centuries.

And so the question arises as we read the first essay, "The Art of Life," whether the fact that an ideal is impracticable should be considered an objection. He begins with the hypothesis that all life is expression, and all expression "has its artistic aspect." And he is poetically correct in declaring that "because of the original artistic sin, the divorce of art from life, we suffer a life without joy," for when all expression has conformed to beauty of line and spirit little will remain to be perfected. But consider the revolution, not to speak of evolution, in life such a doctrine would involve. And he concludes with fervor, "Not until the term artisan has come to be as honorable as the term artist will we have real freedom. . . . And not to believe in freedom is to believe in the ultimate evil of the spirit. For if the good is stronger than the bad, the less repression we have the better." Alas! how long have we watched the fair light upon these heavenly heights of love and peace before Mr. Carman discovered them. He might have written a better book if he could have taught us the way thither. But perhaps it is a distance to be achieved, not learned.

Carman's philosophy justifies the title of this volume, and, summed up, means about this: We are coming together in consciousness—earth, man, nature and whatever is above him—a union, he thinks, that will only be accomplished through unceasing efforts and aspirations, and in his essay, "On Being Strenuous," he has written out his reflections along this line as if they were entirely original. But we should remember that Mr. Roosevelt's idea of the strenuous life and Mr. Carman's are quite different. One is objective in his energies and aspirations, while the other is subjective.

As might be expected, Carman's ethics are altogether æsthetical, as ethics are likely to be where grown in the flower garden of a poet's mind, where they are never tested by the raw atmosphere of the real world. In his notes on "The Crime of Ugliness," he writes, "Beauty

* THE KINSHIP OF NATURE. *By Bliss Carman.* Boston: L. C. Page & Co. $1.50.

is really only another name for goodness, and the maintenance of beauty is as much a moral duty as the maintenance of goodness." Following this statement is a spiral of logic which ends in the conclusion that goodness alone satisfies the emotions, truth only satisfies reason, and beauty, taste. Thus he appears to make a new trilogy of man's threefold nature and proves to his own satisfaction that "taste, conscience and reason are of equal importance." All of which is poetically true, but there is so much left of life *not* poetic that we should find it difficult to maintain our realities at Carman's altitude. Indeed, it is a sweet madness to declare, "I call ugliness, or the creation of what is not beautiful, a crime." And in the further development of his ideas along this line the distinction he makes between soul and body is so thin that we scarcely have dust enough left to cover our immortality. But this is a poet's error, and while we of the literal mind, recognizing the need of homely things to fit homely people, may not agree that it is a *crime* to create ugly ones; on the whole, it must be admitted that his heresies treat of those happy and harmless illusions which alone fulfil our faith in the ideal, since the ideal does not yet exist in any other form.

The literary style in which the author presents his thoughts is unimpeachable, of course. There is no eccentric use of words, but he shows a delicacy and a wit as to the value of their meaning. He steps from one paragraph to another with a precision that is almost abrupt, because he sees clearly what he has to say and there is no confusion of words between his ideas. And while the reader may resent his tender patronage, he cannot altogether withstand the spirit of one who thus defines the religion of his own vocation, "The pursuit of the unattainable is the piety of art." There is courage as well as wisdom in such sentiment.

A Dartmoor Romance

THE American tourist is usually surprised at the amount of waste land in England, at the numerous moors which have remained throughout the centuries untilled and uninhabited. He is apt at first to regret that so much land must be idle and unproductive in a country where land is so much needed, but as he thinks further he realizes that the moors are really the most fertile parts of England, the only agricultural region which supplies articles for export. It is fertile in fiction and grows more good novels per square mile than any other soil in the world, when cultivated by such authors as Blackmore, Brontë, Hardy and Phillpotts.

*The American Prisoner** is a genuine romance worthy of its wild and picturesque setting. It has enough exciting incident in each chapter to supply Mr. Howells and Mr. James with material for several volumes. With a secret cave, where is hidden the treasure, including the heroine; with really wicked villains of both sexes, who quote poetry and worship antique pottery; with sedition, treason, war, violence, sudden death, and all the other things from which in real life we pray to be delivered; with three lovers for one girl and a relentless father, we have a story which may be guaranteed to keep the reader at least three hours past his usual bedtime. The well written descriptions and a certain loftiness of diction save it from being mere melodrama; but it is strongly dramatic and one constantly imagines it as seen on the stage. We trust that the Devon dialect is correct, for the American dialect in the book certainly is not.

The real hero of the story is the self-sacrificing lad who gives his life that the lovers may be happy, but the nominal hero is Cecil Stark, an American soldier of the war of 1812, in the Princetown prison. Since he is a descendant of Molly Stark, literary genealogists will be able to trace her relationship to Molly Stark Wood, the heroine of "The Virginian." The turning point of the plot is the celebrated "Dartmoor Massacre," April 6th, 1815, when the American prisoners, who were attempting to escape, were fired upon by the guards and many of them killed and wounded. The book must not, however, be classed with those historical novels which consist of a mass of archeological details and pen sketches of great men strung together by a thread of romance.

* THE AMERICAN PRISONER. *By Eden Phillpotts.* New York: The Macmillan Co. $1.50.

The United States in Our Own Time. A History from Reconstruction to Expansion. By E. Benjamin Andrews. New York: Charles Scribner's Sons, 1903.

E. Benjamin Andrews's extension of his "History of the Last Quarter Century" is a fine piece of popular history writing. The style, tho distinctly journalistic, is not offensively so. The treatment is superficial, and the subjects which are given the greatest space are those of the greatest human interest, regardless of their political, constitutional or economic importance. These faults, however, are the very virtues which will commend it to a popular audience. The narrative is not closely knit, with cause and effect always binding the incidents together, but the only link, as a rule, that connects the chain of events is that of chronological sequence. Again, the fault will secure for it a larger public than a more scientific treatment would have won. Another feature of the volume which will aid its popularity is the great number of illustrations, over 500 in a book of 930 pages. For the most part these are not badly chosen, the purely fanciful and therefore unhistorical pictures being in the minority. In addition to portraits there are many "scenes and views," with a good sprinkling of plans, maps and *fac-similes*. There are some very characteristic features of our recent social history for which one looks in vain. The work is brought up to the late Post Office scandals, but there is nothing of the convict labor scandals, nothing of the disfranchisement conventions, nothing of the work of Hampton Institute, nothing is said of the influence of the W. C. T. U. in spreading prohibition sentiment and invading the public schools with anti-alcoholic text-books. Kindergarten education and co-education, college and social settlements, primary reform, sanitation, prisons, probation, poor-relief, and individual training, all receive no word of notice. One would think that McMaster had never shown the possibilities for the historian that lie in these interesting fields. The general character of the work may be learned from the subjects of some of the more striking chapters. The worst features of Reconstruction are treated in the chapter "'Carpet-Bagger' and 'Scalawag' in Dixie." An interesting period in our Indian history is told in "Indian Wars and Custer's Death." "The Agrarian and Labor Movements in the Seventies" get a very fair and full treatment. The chapter on "Farthest North" is a fascinating story of the "Jeannette" Expedition, the Greely and the Greely Relief Expeditions. Chapter XX is a medley of everything, from the "Messiah Craze" among the Indians to the hurricane in Samoa and the Anti-Polygamy laws. In the treatment of all poltiical problems, such as are met in the chapters "The Democracy Supreme" and "The Battle of the Standards, and the Republican Restoration," the author is eminently fair-minded. Taken as a whole, the book is one of the best of the purely popular presentations of recent American history.

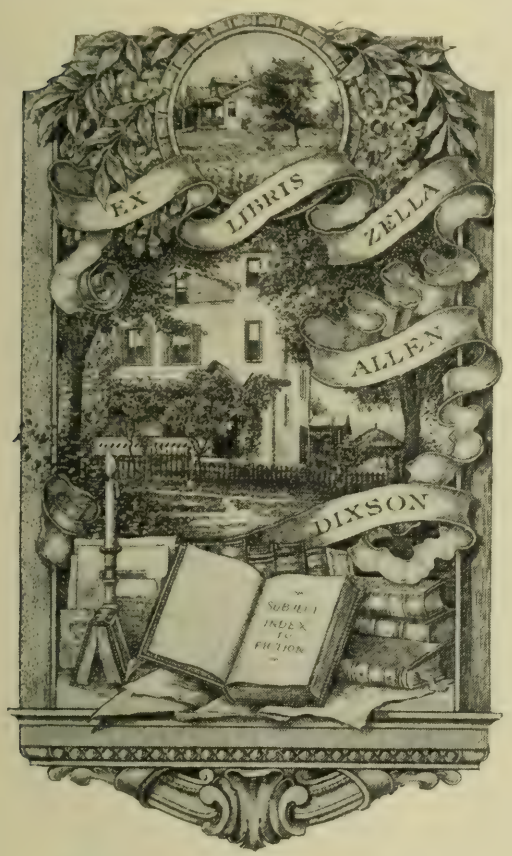
American Flag Raised Over Battered Remnants of South Gate Immediately after City's Capture, Battle of Tien-Tsin, China (Copyright, 1901, by Underwood & Underwood)

The Nature of Man. Studies in Optimistic Philosophy by Elie Metchnikoff, Professor at the Pasteur Institute, Paris. The English Translation edited by P. Chalmers Mitchell, M.A., D.Sc. Oxon., Secretary of the Zoological Society of London. New York: G. P. Putnam's Sons.

Professor Metchnikoff's book on "The Nature of Man" attracted widespread attention in the original French, and the translation promises to secure a wider circle of readers. It is to Professor Metchnikoff that we owe the most suggestive theory in pathology at present before the scientific world. He first showed that the white blood cells engloped bacteria and other irritating substances within the body, which were either digested or carried to a distance from their original location, where they would be less nocuous. He it was who showed the reason why leucocytes gather round an infected area and lay down their lives in the lining cavity of an abscess wall, or are thrown off in the shape of pus cells, martyrs to duty on the frontier. In the present volume he has attempted to show that science will eventually make life more livable and so lessen its inconveniences as to leave no necessity and no desire for a life beyond this present one. He does succeed in showing very well the disharmonies in nature among the lower animals as well as in man. Especially is he able to point out the manifold disharmonies of man's physical constitution and the inevitable discomforts attached thereto. When it comes, however, to the declaration of what science has accomplished to alleviate the disharmonies of the human constitution, most people will find the chapters very unsatisfactory reading. He has to confess, notwithstanding recent advances in therapeutics, the utter failure of science to cure the most serious scourges of humanity—plague, tuberculosis, and especially malignant diseases. He even has to admit that as science has succeeded in keeping people alive to an older age than before, this has been followed by an increase of that insurrection of the body cells we know as cancer, which has increased, instead of diminishing, in spite of all the sanitary advances and of prophylactic efforts. Medical science is totally at a loss to account for the cause of it, and theory of explanation follows theory, while the affection carries off more human beings than all the infectious diseases combined, with the exception of tuberculosis. The application to real life of the doctrines set forth in the book forms the concluding paragraph, in which the author declares that science must bring about a modification of human nature after a higher ideal, if such an ideal can be formed as will unite men in the religion of the future. "This ideal must be founded on scientific principles. And if it be true, as has been asserted so often, that man can live by faith alone, the faith must be in the power of science."

Gorgo: A Romance of Old Athens. By Charles Kelsey Gaines. Boston: Lothrop Publishing Co. $1.50.

That Theramenes,



> "that cunning man and shrewd
> In all things, who, if ever he should fall
> Into misfortunes, or be near to fall,
> Slides out again, no Chian, but a Coan"—

should be chosen as the hero of a love romance seems a bit incongruous; but, beyond the fact that the eleven drag him off to the hemlock cup at the behest of Critias, there is little effort at verisimilitude in the portrait. The Athens of Pericles, of the 400, of the thirty tyrants, whereof he was one, furnishes the swain, and the Sparta of Lysander the somewhat athletic maid. The adventures of the lover lead him to an active part in the ill-fated Sicilian expedition, and in the naval fight at Arginusæ; and an infinity of graphic details of everyday Greek life of the period, betokening no small amount of research on the part of the author, fill the picture. The story is exceedingly well told, and there is a recognizable Greek swing to its style. Besides, it has a value of its own in offering an easy entrance into Greek history, not only for young people, but for their elders, who, conscious of the present revival of interest in the most wonderful of all nations, find themselves repelled by the dry details of endless little wars and political changes which make up no inconsiderable fraction of standard historical works. A step beyond "Gorgo," brings one to Butler's "Athens" and Abbot's "Pericles," and beyond that lies

Mahaffy, and so begins the road toward the end of which which are disputations over the canon of Plato and with Mr. Russell Sturgis on the curve of Ictenus's stylobate.

Concerning Book-Plates. A Handbook for Collectors. With illustrations and plates. By Zella Allen Dixson, A M. Edition limited to 900 copies Chicago: The Wisteria Cottage Press, $3 50 net.

The author of *Concerning Book-Plates* is intensely interested in her subject. Her book shows this through and through. In it she has given her readers something of her own experience in collecting book-plates, and has pointed out the desirable and undesirable things to do when one becomes a follower in the author's footsteps. The personal touch she has given to her theme makes it more than ordinarily interesting, and the dainty typography of her book is quite in harmony with what she has written. Her little book recommends the collecting of book-plates, and it is evident that the idea of vandalism in so doing is not even remotely entertained. The author's personal book-plate, which appears in her book, and which is here reproduced after the original by J. Winfred Spenceley, is an excellent example of the modern pictorial plate. In it appear as details the old Dixson family homestead at Zanesville, Ohio, and also the author's pretty summer cottage at Granville, Ohio, for which the Press is named. The open book shown is in reference to a former volume published by Mrs. Dixson, who is librarian of the University of Chicago.

Book-Plate of Zella Allen Dixson
From "Concerning Book-Plates," Wisteria Cottage Press

The Gates of Silence with Interludes of Song. By Robert Loveman. New York: The Knickerbocker Press.

The volume, which is an unusually slender one, even for poetry, contains some nine brief songs and fifty "fillers"—that is, bits of verse, from eight to twelve lines in length, such as the magazines use in making out a page at the close of a long article. Many of them are very good indeed in their kind. They are much more serious in tone than such verse is usually, they are possessed of considerable lyric feeling, and they have a neat and epigrammatic turn which suits their brevity and purpose without detracting from their poetic spirit. Perhaps the following is as good an example as can be picked:

"Poor rambling, shambling soul of mine,
Beyond the night, beyond the day,
When thou dost unto death resign
This happy habitat of clay,

"In high conclave, at feasts divine,
Will legions leap to heed thy nod?
Or, doomed to darkness, wilt thou whine,
A beggar at the gates of God?"

McTodd. By Cutcliffe Hyne. New York: The Macmillan Co., $1.50.

Life in the Mercantile Marine. By Charles Procheroe. New York: John Lane.

The sea yarn is evidently forging ahead in popularity. Now comes McTodd, Scot, a marine engineer, who has learned his trade in the finest ships, but who, because of an unappeasable taste for whisky and a resulting desire to pound the police, never gets his certificate as chief engineer. He is also a modern Berserker and a marvel of filial

duty, of which last there is a bit too much iteration. This combination being placed on a "tramp" steamer, or an illicit sealer, or an Arctic exploring ship, a series of tales of undeniable originality and novel effect result. With them are interwoven love stories, some Munchausenisms—such as launching a steamer from the top of a lofty iceberg—and a great deal of that peculiar sea humor, which, since it belongs to the stoke-hole and not to the deck, is of much newer quality than that which the shiver-my-timbers variety of sailorman usually dispenses.

"Life in the Mercantile Marine" has no reason for existence, being a rambly narrative of everyday maritime experience, destitute alike of novelty and merit.

The Religion of an Educated Man. By Francis Greenwood Peabody. New York: The Macmillan Co. $1.00 net.

Three lectures to the students of Haverford College on "Religion as Education," "The Message of Christ to the Scholar," and "Knowledge and Service." Professor Peabody is always stimulating and uplifting, and to him can be applied his own words, descriptive of another—"the quality of wisdom, insight, foresight, grasp, discernment—a habit of mind not to be derived from instruction alone, not dependent upon the amount of information one has acquired, but the mark of intellectual power, of spiritual force, of original genius." The second lecture, on the necessity of moral excellence and spiritual devotion in order to true scholarship, is especially to be commended.

Life of Leo XIII. By Right Rev. Bernard O'Reilly, D.D. In two volumes. Philadelphia: The John C. Winston Co.

The authorized biography of the late Pope, written clearly and interestingly, from the point of view of an earnest adherent and devoted admirer. Monsignor O'Reilly collected the materials for a biography industriously, and his book contains valuable historical documents, especially the important Encyclicals of the late Pontiff, which attracted wide attention and exerted much influence.

The Louisiana Purchase. By Ripley Hitchcock. Illustrated. Boston: Ginn & Co., $1.25 net.

Mr. Hitchcock's account of the exploration and building up of the territory purchased from France in 1803 is spirited and captivating. He includes in his narrative the entire period from the early Spanish discoveries to the present, while an appendix gives copious statistics of the States and Territories erected out of that cession. The Lewis and Clark expedition of 1804-06 is traced from its beginning to its return, at considerable length, and Pike's and Fremont's explorations are also detailed. There is an interesting but brief account of the "pony express" which ran between St. Joseph and Sacramento from 1860 to 1862, but was discontinued when the telegraph was stretched across the plains. The last chapter, on "Permanent Occupation," gives a summary of the more important data, including and following the period of the Civil War. The book is well illustrated. Unfortunately, a number of errors and inaccuracies have been allowed to creep in. Some of them have to do with dates and a number with the delimitation of the territory of the purchase. The placing of the battle of the Little Big Horn (not "Big Horn," as Mr. Hitchcock has it) in Wyoming instead of Montana, and the rating of the taxable value of the present wealth of the cession as *four* times instead of more than four hundred times the purchase price, are among the more palpable errors.

Miladi. By Clara E. Loughlin. New York: Fleming H. Revell Co., $1.50 net.

We all know about "sermons for men only," and how lacking they often are in sensational features. Now, under the alluring title of this volume, we have really a series of "sermons for women only"—not that any man would blush at the contents, but he would be no more interested in this unfolding of the pretty process by which an awkward girl is changed into that illusive, charming perfection, "Miladi," than he would be in studying the gores, plaits and flounces of her wardrobe. But it is a very serviceable book for aspiring mothers and maidens, written in a delightful style by who understands all the social, domestic and foreign perplexities of "Miladi."

Heroes of Chivalry. By Louise Maitland New York: Silver, Burdett & Co. 50 cents.

It has long been recognized by educators that the history of an epoch could be best studied, even by elementary students, from contemporary literature, but the difficulty has been that original documents are so dry and tedious, and so full of uninteresting and unimportant details as to be unreadable except by specialists. In the *Heroes of Chivalry,* however, these difficulties have been overcome, and medieval stories are rewritten in an easy and attractive style. We venture to say that a boy who reads these stories of King Arthur, the Quest of the Holy Grail and Roland will get more comprehension of the real spirit of the age of chivalry than he would by the study of a scholarly volume about it.

From "Heroes of Chivalry." Copyright, 1903, by Silver, Burdett & Co.
"Sir Launcelot Lay Under the Apple Tree"

Two Sides of the Face. By Quiller-Couch. New York: Charles Scribner's Sons, $1.50.

There is a difference between the faculties of the author who writes facts, or even philosophical conclusions from facts, and the one who creates characters and situations. The former may work to the limit of his endurance without marring the quality of his output, because his labor is largely a matter of comment, of tabulating, and connecting what already exists, and has only to be discovered. But the latter cannot produce rapidly without suffering the consequences in his art. A thing that is created must have full time for generation and growth in the mind or it will bear the marks of miscarriage, even of abortion, upon it in form or character. This is a fact often ignored by the best writers of fiction. Once a man discovers in himself a faculty for creating, and a madness seizes him to people the world with the creatures of his brain. He has no sooner dramatized one phase of existence before he is boldly ready to undertake another quite foreign to it. He is a man seeking adventures in his own imagination rather than the perfect form

of expression of art. And he is in as great a literary hurry as the old theologians who represent the world as having been created in six days. This accounts for the fact that we have so many authors among us whose mere manner has outlasted their impotent genius. They write as delightfully as they ever did, but they do not really produce any more. And this volume of short stories by Quiller-Couch is an illustration in point. They wear the distinction of his literary style, but there is nothing really vital in the substance of them.

Literary Notes

CHARLES H. THURBER, manager of the editorial department of the publishing house of Ginn & Co., has been admitted to membership of the firm.

....The March number of *The House Beautiful* is of especial interest to educators, on account of the articles on the "Artcraft Movement in Newcomb College" and the "Education of the Housekeeper," by Marion Talbot, of the University of Chicago.

....Messrs. Laird & Lee, of Chicago, are issuing a very handy edition of Webster's New Standard Dictionary, which they call the Library edition. It is, of course, very much condensed and abridged, but is a very convenient hand-book for the business office or correspondence room. It contains over 900 illustrations and 30 full page plates. The volume has indexed pages. The price is $2.50.

....One of the reasons why the custom of asking a blessing at the family table shows a tendency to go into disuse is because the ceremony is apt to become perfunctory and sink into vain repetition. Almost any one will add to his knowledge of appropriate forms by the reading of the little collection of table blessings, entitled "Grace Before Meat," published by the United Society of Christian Endeavor (Boston, paper, 25 cents).

....One of the most important of the indirect effects of the Louisiana Purchase Exposition is the stimulation of interest in the history of the West, which is shown especially in the publication of annotated editions of early explorers. Among these the "Trail Makers" Series, announced by O. S. Barnes & Co., promises to be of great value. The first volume gives the complete narrative of the journey of Coronado, who first entered the region of the great plains in search of the seven cities of Cibola, but found instead of these rich and fabulous cities only prairie dogs and "crooked-backed oxen."

Pebbles

Mrs. De Flat: "Have you anything new in folding beds?" *Dealer:* "Only this, madam, and it really is quite a success. On arising in the morning you touch a spring, and it turns into a washstand and bathtub. After your bath, you touch another spring, and it becomes a dressing case, with a French plate mirror. If you breakfast in your room, a slight pressure will transform it into an extension table. After breakfast, you press these three buttons at once, and you have an upright piano. That's all it will do, except that when you die, it can be changed into a rosewood coffin."—*New York Weekly.*

....Herbert Spencer was a man of markedly regular life. Three hours a day were devoted to his literary pursuits. His hours of relaxation were largely spent at the Athenæum Club, where he went to drink weak tea, smoke mild cigars and play billiards. At this game he had attained considerable proficiency, and piqued himself not a little upon the mathematical exactitude with which shots were planned. It was in the Athenæum billiard room that he pronounced a much quoted epigram. He had happened into a game with a rather foppish member who, after complimenting him upon the theory of his shots, proceeded to run the string out with distinguished ease. A second game resulted in the same way and Spencer walked over to the rack, put his cue up and turned to his opponent. "Sir," he said impressively, "to play a good game of billiards is the mark of a well rounded education; to play too good a game of billiards is the mark of an illspent youth."—*London Times.*

....Dean Pigou, in his "Odds and Ends," tells of a scholar under examination in a Sunday school who was asked, "What, my child, are sins of omission?" and answered, "Those which we ought to have committed and have forgotten to commit." Again, "What is meant by sowing tares?" Answer, "Mother mending my breeches." The Dean tells of the following letter which was written by a young lady of nine and was deposited in a hole in the garden as a sort of postbag for the infernal regions: "Dear Mr. Satan: Will you kindly come and take away Aunt Jane? She is a very fussy person, and does worry me so. Yours affectionately, Alice." Among odd advertisements the Dean mentions the following: "Two sisters want washing. Apply, etc." Here is another, brief but suggestive: "Three young ladies about to travel are in want of a legal adviser, a chaplain, and a doctor. N. B.—No one over 35 need apply." Another: "For sale, a piano. Full description given, by a widow with walnut legs." And yet one other: "For sale, a fine bull-terrier dog, two years old. Will eat anything; very fond of children."

Editorials

A Motion to Take from the Table

THIRTY-THREE years ago THE INDEPENDENT published a series of articles on conditions in Santo Domingo and the policy which the United States ought to pursue in regard to that island. A treaty had been signed by the Presidents of both republics by which Santo Domingo was to come under the authority and protection of the United States, like Alaska a short time before, and so far as the will of the people could be ascertained they were anxious for annexation. If President Grant's policy had been followed, we believe that Santo Domingo would to-day be as peaceable and prosperous as any of our Gulf States. But he had against him not only the Democratic Party, but many of the most influential men in his own party, and the treaty failed of ratification by the Senate. It ceased to be a matter of practical politics, or, in parliamentary language, the question was laid on the table.

To-day Santo Domingo comes again before the public eye on account of its almost incessant civil strife, culminating in an attack on American marines. Again we present to our readers as reliable articles as we can get on the conditions which prevail there. It is in some respects a more discouraging picture than the former. The public debt is larger, industrial conditions are worse, and the people do not seem to have attained any higher degree of civilization. Circumstances now compel us to some degree of intervention in the affairs of Santo Domingo. Whatever form this takes, it will be resented and opposed by some at least of the factions of the island. Where once we were invited, now we must intrude. The responsibility which we then refused is now being thrust upon us.

From Secretary Loomis's note we learn that the present administration has no thought of annexation. This is undoubtedly true. The acquisition of the canal strip is glory enough for one administration, and the utilization of it is work enough for another. But the time is suitable for the calm discussion and careful consideration of our interests and duties in regard to Santo Domingo, and we, therefore, move to take this question from the table, where it has reposed for a generation.

We believe it is inevitable that our relations with Santo Domingo and other West India islands will become closer in the future, and that in regard to them we should have a predetermined and consistent policy in order that this evolution may be gradual and peaceable, instead of accidental and vacillating.

We have seen no reason to change our position on this question, but, on the contrary, the events of the past thirty-three years have added many new arguments to the old ones, and we believe that the following extracts from our editorials of 1871, which we republish without the change of a word, will not appear so chimerical nor arouse such heated opposition as they did when first published:

> There is hardly an American who does not desire "all the land that joins" ours, with no particular objection to land that does not join, when as in the case of Alaska, it may prove a pawn that will one day enable us to checkmate a king. So strong is this desire for territory that publishers vend their wares by giving to a map of everything from Panama to Prince Edward's Island the title "Our Country Present and Prospective." With all the unused land we have, our conquering imaginations have already taken the rest of the continent into the hospitable arms of the Republic. We are free to confess that, for many reasons, we should like to see the Dominican Republic annexed. It would plant another star in the blue sky of the flag, and plant the flag prophetically in the waters of the Caribbean. To have oranges, bananas, pineapples and other tropical fruits in our own natural garden, to cut ebony, mahogany and satin wood in our own forests, is rather a pleasant prospect; while coffee, cotton and sugar-fields and gold, silver and copper mines are not to be despised. It would be exceedingly gratifying to our pride to secure the Dominican Republic for other reasons. In its present relations to the stronger

government of Haiti, on the other end of the island, it affords a perpetual pretext for the interference of the European Powers in their affairs. That all of these petty states will sooner or later place themselves under the protection of our federation, there seems to be no kind of doubt. And, if we cheerfully receive the immigrant that brings with him no soil, why should we refuse a contiguous nation of a hundred and fifty thousand people, who bring their coffee plains and mahogany mountains?

If the people of the Dominican Republic wish to come, bringing their land with them, it seems hardly fair for a nation that receives everybody else to forbid them. At least, there is so much to be said in favor of the wisdom of annexing them that we think the President certainly does not deserve censure or suspicion, especially as he acts in accordance with the general tendency of popular opinion.

Then there is the old question of buying a lawsuit. Do the people want to come? Will they stay? What are their complications with other Governments? Is the title good? If we inherit a quarrel with Haiti that will involve us in war, cruelty and conquest, let us not set a foot in the island. If the people do not sincerely desire annexation, we must not secure it by trickery and force. If the State of "Santana," or "Baez," or "Domingo," or "Grant," or whatever it shall be called, is to be the subject of perpetual revolution and insurrection, then we do not want it.—[Editorial, THE INDEPENDENT, January 5, 1871.]

But these blemishes and errors ought not to prejudice the case. It is simply this: a distracted people, not too far disant from us, offer us themselves and their land at our own terms. They want protection to their industry and a chance for development. Of course, there are jobs and personal interests; but these are unavoidable and should not obscure the main question.

There are two ways of considering the matter. We may look at our immediate interests, or at theirs. If asked whether we need Santo Domingo, we should certainly say, No. We can get along without it. We do not need its acres or its tropical fruits. We have land enough, yet uncultivated. We do not need its people. They will not be for years an element of the least strength. And to many this will be argument enough. But Santo Domingo needs us, and to us that is argument enough. It would not be argument enough if there were any danger that Santo Domingo could hurt us. But that we cannot believe. As philanthropists and Christians, and no less in the interests of the broadest patriotism, we would annex any neighboring territory which our institutions would bless. Our own interests may say, No; broader interests say, Yes. Party may say No. Christianity says Yes. We concede that this is what has been ridiculed as the "missionary argument;" but there can be no higher one.

If the United States has one "mission," it is to propagate liberty, under the direction of education and morality. True, this, like all charity, must begin at home; but it has begun at home, and we can afford to go abroad—at least, to those that ask our help. It is not true that we cannot educate or defend our own people. We are doing it with commendable speed; and it requires no shrewd vision to see how rapidly we are welding white and black, Scandinavian, Teuton, Celt and Spaniard into one people with an homogeneous culture. There is vigor enough in our institutions to mold this little State.

Our country has had some experience in annexation; but even when intended for evil, it has turned out for good. Nobody is sorry now that we made the Louisiana or Florida purchase. No one charges that we are the weaker for having taken Texas and California. All these Territories had a population and a language utterly diverse from ours; but we have assimilated them. Our assimilating power is no feebler now; and it is just because that Santo Domingo needs this energetic Anglo-Saxon influence that we are in favor of extending our "mission." We are not insensible to the glamor of "Manifest Destiny," which means a destiny of power and control; but there is a higher and no less manifest destiny to which the nation must not be untrue—a destiny to extend sound government and stable institutions.

But it is said that annexation would be the ruin of a negro State. If so, so be it. The negroes there begin with every advantage. They have the population; and if, in the struggle for existence, another race proves stronger, then all the better. Negroes ask no exceptional favors. They do not want to be coddled. They must have equal rights, and then fight their way, like white men. No old man among us but can count up scores of families that have become extinct because they had not stamina. And if the negroes or the white men of Santo Domingo, or of the South, under fair laws, cannot swim, they must sink, call it fate or law, or what we will. It is best that the best should survive.—[Editorial, THE INDEPENDENT, April 13, 1871.]

An Isthmian Canal at Last

IT is difficult to realize that at last the way is open for the construction of an Isthmian canal, and that the United States is about to make a canal on the best route and under the most favorable conditions. But it is true that the end of all delays has come. Within a year there

will be 30,000 diggers at work on the Panama route; in less than ten years ships will be passing through, from one ocean to the other. And this grand waterway is to be the property of the United States, which will hold it in trust for the good of the world.

The restrictions of old partnership agreements have been peacefully removed; the opposition of powerful railway companies has been overcome by argument or by action; influences that had been drawing the nation toward an inferior route have been counteracted by the skill and energy of farsighted men. Even the wild forces of nature, exhibited in volcano and earthquake, gave timely aid in diverting us from Nicaragua to Panama. We were saved from a blunder which we should never have ceased to regret, and for which we might have paid in blood. We lost our treaty with Colombia, only to gain in the place of it another and an immeasurably better one, the terms of which, written by ourselves, leave nothing to be desired. And so at last we come to face the great work, free to take it up and finish it with the skill and energy and strength of the American people.

By the ratification of the Hay-Varilla treaty and the appointment of the Commission a line has been drawn between the old and the new. Behind it are laid aside the long war of the routes, the charges of connivance and intrigue, the endless harangues of a Morgan, the bitter partisan attacks of a Carmack, the premature insinuations and the timely repentance of a Hoar. Before it lies the work to be done. The canal has been taken out of politics. Circumstances attending the birth of this treaty ceased to be available as a partisan issue when sixteen of the thirty-three Democratic Senators voted for ratification. Admitting that the Democratic opposition was in part conscientious, we must say that it was also in part blindly partisan and injudicious. The party has gained nothing by it, unless it is inclined to regard as a political blessing the disappearance of Mr. Gorman as a candidate for the Presidential nomination. Due credit will be given to the Republican party and to its representatives at the head of the Government, but the canal is not a partisan undertaking. We are glad of that. The tireless energy—misdirected in recent years—of Mr. Morgan, and the votes of sixteen Senators are a matter of record. Both parties will support the work in their national platforms, altho in one of them there may be a faint echo of this session's partisan criticism. Both will vote for the necessary appropriations and rejoice over reports of commendable progress.

For the Commission the President has selected Rear-Admiral Walker, thoroughly equipped by his experience at the head of the Nicaragua and Isthmian Canal Commissions, in connection with which he exhibited rare executive ability and skill in diplomacy; General George W. Davis, an engineer, who has been directly interested in Isthmian canal work for many years, and who was the engineer director of the Maritime Canal Company of Nicaragua; William Barclay Parsons, engineer of the New York Subway, now approaching completion; William H. Burr, Professor of Civil Engineering at Columbia University, and formerly a member of the Isthmian Canal Commission; C. Ewald Grunsky, an eminent consulting engineer of California; Benjamin M. Harrod, engineer, for twenty-five years a member of the Mississippi River Commission, and Frank J. Hecker, of Michigan, who was attached to the War Department as Superintendent of Transportation during the war with Spain. Vague attacks upon Colonel Hecker have been made in the press, but they have not been accompanied by specifications. He was appointed Superintendent of Transportation by President McKinley, upon Mr. Hanna's recommendation. Concerning the Commission as a whole we have heard no expert criticism, except that three of the five engineers appear to have had no experience in connection with the construction of canals.

The work first to be done is of a sanitary character. This is admitted by the Commission. Both Panama and Colon must have sewers and public water supplies. Colon is to be lifted out of the marsh upon which it rests. Villages on the canal route must be

cleaned. Hospitals and other buildings, of which the Canal Company owns more than 2,000, will be repaired and placed in good condition. Our Government's authority is ample, in the cities and along the canal strip, for any sanitary improvement that may be required. We believe that by the exercise of it under the direction of experts in sanitation, Panama, Colon and the canal zone can be made comparatively healthful. The triumphs of North American sanitation in Havana and Santiago should be repeated on the Isthmus.

We must not forget that while we shall be rejoicing over the auspicious beginnings of our canal work, Colombia, or at least a large number of the Colombian people, will be hating us with considerable intensity, believing that they have wrongfully been deprived of the most valuable part of their national territory, together with the $10,000,000 and the annual rent which they expected to receive. Now that the canal controversy has been settled for all time and so clearly to the advantage of the United States, we should be glad if an amicable agreement with Colombia could be reached. We ought to be at peace with the South American republics, enjoying the friendship of every one of them. If it be true, as now reported, that General Reyes has been elected President of Colombia, the way will be opened for a reasonable consideration of this question.

Colombia lost the Isthmus and the canal money by her blunders and her greed. She deserved to lose them. But a Power so great as our own can afford to make some effort for the conciliation of this weak and misguided South American nation, hereafter to be a near neighbor of what will virtually be a dependency of the United States. Bereft of her greatest asset, bankrupt, and continually menaced by factional revolution, Colombia may endanger our relations with European Powers by reason of her neglected foreign debt. Conciliation that should extinguish resentment, promote peace and encourage progress, would clearly be to our advantage. The problem is one that may well engage the attention of the President and Mr. Hay. We hope that in some way the United States will be able to assist and appease Colombia, and thus to commend itself to all the countries south of us.

The Art of Writing Love Poems

In discussing recently the decline of St. Valentine's Day we alluded to the disuse of homemade poetry as a medium of courtship. We do not wish to enter here upon the question raised by the Poet Laureate of England, of whether poetry is as much read now as it used to be. We know that there is no perceptible diminution in the amount of poetry written. Our drawer is so full now that we cannot shut it without leaving rimed ends sticking out. But it seems that people write poetry nowadays to editors instead of to their sweethearts. This is a mistake. Would that we could put a stop to this perverted practice. Poetry is much more effective if written to one rather than to many, especially if the one is The Right One, because, if the sentiment is satisfactory, she will overlook such slight blemishes as a line with the accent in the middle of the cæsura.

It may be that lovers shrink from writing poetry on account of an exaggerated idea of the difficulties of the task, or because they have received no instruction in the art of writing love poems. We notice that the modern youth does not know anything except what he has been taught at school, and not all of that. Since, however, there is only one college in the country which includes such an important subject as love-making in its curriculum, it may be that some instructions in this minor branch of that subject will not be amiss.
